Groundnut improved considerably on encouraging advices from producing centres and the likelihood of another rise in groundnut oil prices during the impending festival seasons. Groundnut Karad bold, Saurashtra bold and Saurashtra quality rose by Rs 8 each to Rs 637, Rs 642 and Rs 646 per 100 kg.

Castorseed and its oils also rallied smartly. Sellers were reserved on account of poor arrivals at the producing centres and firm advices from upcountry centres. Besides, castor oils attracted miller support. Madras small and Kanpur bold advanced by Rs 10 each to Rs 332 and Rs 324 per 100 kg. Castor oil commercial gained Rs 2.50 at Rs 71 and BSS oil Rs 3.25 at Rs 76.25 per 10 kg.

Linseed and its oil also came in for good support in view of the poor stocks. Linseed bold moved up sharply by Rs 20 to Rs 520 per 100 kg and its oil by Rs 6.24 to Rs 135.20 per 10 kg.

Among cakes, groundnut expeller was up by Rs 50 at Rs 2,100 and de-oil by Rs 25 at Rs 1,600 per tonne. Castor was steady at Rs 775 while cottonseed eased by Rs 25 to Rs 1,575 per tonne.

Comparative prices in rupees per quintal of seeds and per 10 kg of oils :

	1-8-1981	25-7-1981
G. nut		
Karad bold	637.00	629.00
G. nut oil	159.00	152.36
Cast. Md. Sm.	332.00	322.00
Cast. oil com.	71.00	68.50
Cast. oil BSS	76.25	73.50
Linseed bold	520.00	500.00
Linseed oil	135.20	128.96

Grains subdued

Bombay, August 3

A subdued tendency prevailed in foodgrains in the local market during the past week.

In cereals, wheat superior variety ruled in the range of Rs 275-330 per quintal, thus showing no change over the week. Demand was slack. Supplies were limited. Sellers were reserved. The Saurashtra variety hardened by Rs 3 at Rs 215-235 per quintal.

Activity in rice was moderate, arrivals were limited. The undertone was steady. Sellers were reserved. The basmati variety was traded at Rs 450-600 per quintal and Surti kolam at Rs 340-400 per quintal.

In coarse grains, maize declined by Rs 25 to Rs 130-135 per quintal. The inflow of other coarse grains was slack. Owing to lack of buying support jowar and bajra maintained last week's levels of Rs 190-225 per quintal and Rs 185-230 per quintal respectively.

Among pulses gram declined by Rs 9 to Rs 410-427 per quintal on account of moderate inflow and poor demand. The inflow of kabli gram continued. Buyers were lifting forward delivery goods. Masoor dal was quoted at Rs 515-520 per quintal.

Sugar advances

Bombay, August 3

Sugar prices in the local market displayed firmness during the past week on brisk demand from local dealers and bulk consumers. The price of C-30 grade sugar gained Rs 30 per quintal to Rs 649-657 per quintal. The inflow was restricted. Arrivals were easily absorbed. The undertone was firm. Sellers were reserved. The weekend stock was placed at 4,965 bags. The price of sugar C-30 as on August 1, 1981 was lower by Rs 133 per quintal than on the corresponding date a year ago.

Gold quiet, silver up

Bombay, August 3

An almost quiet tendency in gold and an erratic tendency in silver marked trading in the Bombay bullion market in the past week.

Standard mint gold opened at Rs 1,672 per 10 gms and closed at Rs 1,670 per 10 gms. Silver (.999 fineness) opened at Rs 2,505 per kg and after having ups and downs closed at Rs 2,560 per kg.

Money : Conditions easy

Bombay, August 3

Money conditions in the 3ombay short-term money narket remained easy during he past week. In the interank call section, both notified nd commercial funds opened t six per cent and receded to hree per cent on Tuesday July 28) and came to the reek's low of 2½ per cent on 'riday (July 31). The rates ardened to eight per cent on aturday. However, the maret closed at seven per cent.

ank credit, aggregate eposits expand

Bombay, August 3

Bank credit of the scheduled mmercial banks expanded by s 44.75 crores to Rs 26,777.73 ores during the week ended ly 24, 1981. Aggregate desits increased by Rs 35.84 ores to Rs 40,578.45 crores. lances of the banks with the eserve Bank of India (RBI) reased by Rs 142.38 crores Rs 4,523.07 crores and their rrowings from the RBI by 10.16 crores to Rs 556.13 res.

Notice

IE BOMBAY DYEING MANUFACTURING CO. LTD.

NOTICE

'he 102nd Annual ieral Meeting of the mbers of The Bombay eing & Manufacturing Ltd., will be held at Birla Matushri Sabha- 19, Marine Lines, ibay 400 020 on Thurs- , the 3rd September. l at 3.45 p.m. to tran- the following busi- :

To adopt the Direc- Report and the audited Balance Sheet and Profit and Loss Account for the year ended 31st March 1981.

2. To sanction the declaration of a Dividend.

3. To appoint a Director in place of Mr Pratapsinh Mathuradas who retires by rotation and is eligible for re-appointment.

4. To appoint a Director in place of Mr J. D. Choksi who retires by rotation and is eligible for re-appointment.

5. To appoint a Director in place of Mr J. N. Guzder who retires by rotation and is eligible for re-appointment.

6. To appoint a Director in place of Mr S. R. Vakil who retires by rotation and is eligible for re-appointment.

7. To appoint Auditors to hold office from the conclusion of this Meeting until the conclusion of the next Annual General Meeting, and to fix their remuneration, and if thought fit, to pass the following Resolution as a Special Resolution :—

> "RESOLVED that, Messrs. A. F. Ferguson & Co., Chartered Accountants, be and are hereby appointed Auditors of the Company to hold office from the conclusion of this Meeting until the conclusion of the next Annual General Meeting, on a remuneration of Rs 85,000 plus re-imbursement of actual out-of-pocket expenses."

SPECIAL BUSINESS :

8. To consider and, if thought fit, to pass (with or without amendments as may be permissible), the following Resolution as Ordinary Resolution :

ORDINARY RESOLUTION :

"RESOLVED that, in accordance with the provisions of Section 293(1) (a) of the Companies Act, 1956, and subject to the approval of the Controller of Capital Issues, Financial Institutions and such other approvals as may be necessary and subject to such conditions and modifications as may be prescribed in granting such approvals, and which may be agreed to by the Board of Directors of the Company, the consent of the Company be and is hereby accorded to the Board of Directors being authorised to create a floating charge by hypothecating the Company's current assets, present and future, in favour of its Depositors (present and future) in respect of the Fixed Deposits received from the Public and employees of the Company, the loans from the Shareholders and any other unsecured deposits or loans or borrowings of any kind which have been accepted and which are outstanding at present and which may be accepted in the future."

"RESOLVED FURTHER that, the floating charge to be so created in favour of Depositors mentioned above shall rank subsequent to—

(i) all present and future hypothecations of stocks, stores, work-in-process and book debts in favour of the Company's Bankers for working capital facilities and quasi credit facilities like letters of credit, guarantees, co-acceptance of usance bills covering purchase of indigenous machinery etc already sanctioned or to be sanctioned to the Company in future.

(ii) the mortgages and/or charges already created or to be created in respect of immovable properties and of fixed assets in or attached thereto, present and future, and the hypothecation of all tangible and movable properties and assets present and future.

By Order of the Board of Directors,

For THE BOMBAY
DYEING & MFG. CO.
LTD.
J. D. NANAVUTTY
Secretary

Registered Office :
Neville House,
J. N. Heredia Marg,
Ballard Estate,
Bombay, 22*nd July*, 1981.

Notes :

(a) A MEMBER ENTITLED to ATTEND AND VOTE IS ENTITLED TO APPOINT A PROXY TO ATTEND AND VOTE INSTEAD OF HIMSELF AND A PROXY NEED NOT BE A MEMBER.

(b) The Share Transfer Books and the Register of Members of the Company will remain closed from Wednesday, the 19th August, 1981 to Thursday, the 27th August, 1981 both days inclusive.

(c) The Dividend when declared will be made payable on or after Monday, the 14th September, 1981 to those Members, whose names stand on the Register of the Company on Thursday, the 27th August, 1981.

(d) Declaration in Form '14-B' under Income-tax Rules, 1962, read with Section 194 of the Income-tax Act, 1961, to be effective must reach the Company on or before Wednesday, the 19th August, 1981.

(e) The Members are requested to notify immediately any change of address to the Company.

(f) The relative Explanatory Statement pursuant to Section 173 of the Companies Act, 1956, is annexed to the Notice of the Annual General Meeting posted to the Members.

Manpower for small industry

By SIDDHARTHA GANGULI

THE industrial system of our populous sub-continent has been forced to go the labour-intensive way. Political reasons apart, labour orientation has been the largest common factor in forming the base of our industrial, labour and other policies at the Centre and state levels as a step to reduce the magnitude of unemployment and its associated socio-economic problems. Total or even partial automation is thus considered justified and acceptable only when either the economy of scale demands it or the technology is such that it is deemed essential for techno-economic advancement and its application becomes impossible without automation.

This, in reality, however, leads to a paradoxical situation since most medium and large scale operations require, for achieving viability, a sustained stress on the technological rather than the labour component. Such operations naturally become highly technology intensive thereby requiring a disproportionately high capital-to-labour ratio and a large capital investment which restricts their application to reasonably big public sector companies, joint sector undertakings, and private business houses and multinational corporations. Although the human component carries a much lesser weightage, it is compensated by the fact that the technology-intensive nature of such medium and large industries makes employment of skilled manpower one of its basic functional prerequisites.

The technical skill, in such situations, naturally has to be of a very high order. The engineering institutions, polytechnics, and industrial training institutes (ITI's) — sponsored and run mostly by the government and, in some cases, by private bodies and trusts too, cater to the needs of training the youth for development of such skills. The Government of India also runs two parallel apprenticeship training schemes — technical and commercial. for the youth who are generally placed in medium and large scale organisations with the idea of receiving on-the-job exposure. Many of these organisations have their own training schools and in-house facilities too for developing skilled techno-commercial manpower captively.

Nevertheless, all these training facilities taken together can serve an extremely limited portion of the nation's large unemployed youth segment. The less fortunate ones who, in spite of their keenness, cannot get the opportunity to be exposed to such training and development programmes (which are a preparatory step towards a vocational career), continue to remain unoccupied and fall prey to undesirable company and several of them succumb to the allurement of clandestine occupations. Many thus turn out to be 'anti-social' elements thus adding to our social problems.

So, on the one hand we have the growing population of unutilised untrained youth who suffer the danger of turning anti-social due to lack of proper direction and opportunity, on the other we have the nation's fast-expanding small scale sector starving of suitable manpower for running its technical and commercial operations. While the bulk of the systematically trained and developed skilled manpower gets absorbed in medium and large organisations, the leftouts are either too highly skilled for or reluctant to join a small business or industry. Besides, the small scale sector can hardly afford to pay the price at which such personnel normally sell in the open market. It, therefore, is left to make do with the untrained or half-trained substandard youth force. Very few of the skilled people can be motivated to leave the comfort, shelter, and other attractions of the organised medium or large sector and take up even senior positions in the small scale—not even to face the laudable challenge of developing a small business into a medium and then, possibly, into a large one.

The small scale industries are basically labour-intensive by nature. Certain items, which do not require a very advanced or complex technology and which can be effectively produced by and large through manual operations, thus normally feature in the small scale sector. The Government has also taken steps to reserve certain items exclusively for the small scale to prevent unhealthy competition from medium or large organisations, which, by virtue of their technological strength, can easily have an edge ove the small manufacturer by producin goods on a mass scale, thus leading t cost reduction and better economy.

While the small scale does not require to utilise highly skilled personnel it certainly has to employ people wit some basic knowledge and skill to mak its operations feasible and viable. Sinc most of the small scale organisations i our country still operate at an unorganised level, very few of the unemploye youth even get to know about the oppo tunities that may be available or forthcoming in such organisations. The co factor also stands in the way of the sma scale's advertising the vacancies an openings. The small scale's recruitment thus normally done from amongst know people and circles purely on the basis word-of-mouth circulation of inform tion. It eventually ends up with unsu able personnel, relatives, and acquai tances who cannot be asked to lea easily. These are some of the burni problems from which our vital sma scale sector has been suffering.

The problem is a little too compl to be solved overnight. It can. howev be eased through the means of a step-t step or phased handling. The first st would obviously be to bridge the cons cuous gap that exists today between t demand of a special type of manpov in the small scale sector and the supp of such manpower. This will, in its tu reduce the nation's growing unempl ment problem to some extent.

The type of people that a typi small industry or business would requ need not to have even the level of edu tion up to school-leaving. It is suffici for them to be educated up to Class or VIII. This school education ought be followed by a 2 or 3 years and, some cases, even one year of training basic trades. Although there is at pres an emphasis on work education in school curricula, there is plenty of sc for supplementing governmental eff through non-governmental organisatio The government and non-governme funding agencies should, therefore, courage setting up of such projects facilities on a wide scale throughout country. In this context, the small in tries associations can play a very role in mobilising resources and crea a network of infrastructure for hu resource development.

Dr Ganguli is managing director of Prex Miniclocks Pvt Ltd and management adviser to leading companies.

COMMERCE RESEARCH BUREAU

PREMIER CENTRE
FOR MONITORING CURRENT
DEVELOPMENTS IN THE INDIAN
ECONOMY

* The research work of the Bureau is organised through these nine Divisions :

(1) Agriculture,
(2) Industry,
(3) Corporate Sector,
(4) Regional Economics,
(5) Banking and Finance,
(6) International Economics,
(7) Unorganised Sector,
(8) Science and Technology, and
(9) Special Studies.

* Each Division is manned by experts who have specialised in their respective subjects.

* Over the years the Bureau has built up a comprehensive economic data system which is the only one of its kind in the country today.

* Through its studies published in the "Commerce" weekly and its special numbers, the Bureau has established a high reputation for itself.

* Its exclusive and prestigious "Economic Monitoring Service" is subscribed to by some of the foremost organisations in the public and private sectors.

PEOPLE

Mr P. S. Deshpande, who has been appointed executive director of Bank of Maharashtra on August 13, 1981, has been associated with the bank for 26 years. With a brilliant academic record behind him, Mr Deshpande was till recently general manager of the bank and has specialised in foreign exchange affairs. He is also taking active interest in the conduct of occupational guidance seminars.

Deshpande

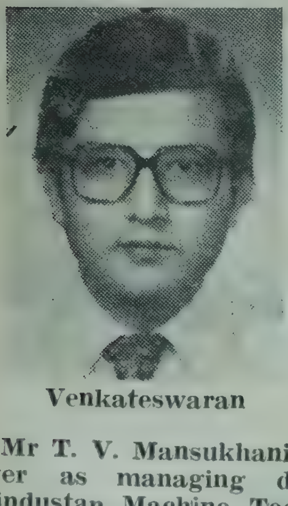
Dr Nanabhoy S. Davar, principal of Davar's College of Commerce, has been elected president of the Bombay Productivity Council.

Mr Surendra V. Dempo, vice-chairman of Dempo Steamships Ltd, has been appointed honorary consul for Portugal in Bombay. Mr Dempo will have consular jurisdiction over the State of Maharashtra and Union Territories of Goa, Daman and Diu, Dadra and Nagar Haveli.

Dempo

Mr Chandrakant R. Trivedi has been appointed executive director of Dena Bank with effect from August 13, 1981. Till recently general manager of the bank, Mr Trivedi joined Dena Bank in 1953 and has since then acquired deep knowledge of the banking industry. He has travelled widely abroad to acquaint himself with modern trends in international banking and is also associated with several rural banks.

Trivedi



Venkateswaran

Mr S. N. Bakshi has been appointed executive director (operations) of Miles India Ltd.

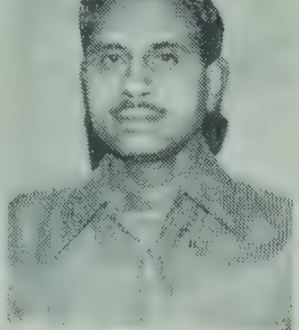
Mr A. V. Ramana Rao, president and managing director of Bharat Metallic Powders Ltd, has been elected president of the Institute of Cost and Works Accountants of India for 1981-82.

Mr Ambi Venkateswaran, who was assistant vice president of Bank of America, has been promoted as vice-president.

Mr T. V. Mansukhani has taken over as managing director of Hindustan Machine Tools Ltd.

Mr H. Mukherjee has joined as managing director of State Bank of Indore.

Mr P. S. Ramohan Rao, the additional inspector general of police in Government of Andhra Pradesh, has taken over as vice-chairman and general manager of AP State Road Transport Corporation.



Rao

THE WEEK

The Union Government announced stricter guidelines for bonus issues by companies on Tuesday whereby companies wanting to make bonus issue will have to produce a no objection certificate from public financial institutions from whom they have taken loans or funds. The gap between any two bonus issues will now be 36 months instead of the present 24 months and the value of bonus shares to be issued must not exceed the total paid-up equity capital of the company. Expectedly the stock markets reacted bearishly to the news. ★

Twenty state governments have announced new loans totalling Rs 457.25 crores and bearing interest at 7 per cent per annum. Subscriptions to the loans will be received from September 1 and the loans will be redeemed after 12 years. ★

Hindustan Paper Corporation has announced a Rs 300 per tonne cut in prices of imported paper bringing them down to Rs 8,200 with effect from August 17. ★

The estimated outgo of foreign exchange as a result of wheat import from the USA will be about $ 293 million, Rao Birendra Singh, Union Agriculture Minister, told the Lok Sabha. ★

About 215,000 tonnes of sugar are being imported from Brazil, USA, South Korea, Philippines and EEC countries at a total value of Rs 100 crores and the commodity is at present being loaded on the ships in these countries, according to the Union Agriculture Minister. ★

The Union Government has decided to set up a 300,000 tonnes per year capacity phosphatic fertiliser project at Paradeep in Orissa with a total investment of Rs 183.64 crores including foreign exchange component of Rs 26.08 crores. The project will be executed by a new public sector company. ★

The Government has decided to waive the import duty on cotton being imported from Pakistan through Cotton Corporation of India. Pakistan has agreed to supply one lakh bales of medium and short staple cotton at fixed prices. Indian mills have reportedly so far booked 50,000 bales of the Pakistan cotton. ★

The Kerkar committee on slums and dilapidated houses, appointed by the Government of Maharashtra, has submitted a 126-page report to Chief Minister, Mr A. R. Antulay. ★

Wholesale price index

At 285.7 the latest available wholesale price index for the week ended July 25, 1981 showed a rise of 0.2 per cent over the preceding week and 9.8 per cent over the year.

Money stringent

The Bombay short-term money market witnessed stringent conditions as on Monday (August 10, 1981). Both notified and commercial funds were renewed at ten per cent and nine per cent. Fresh money was transacted at nine per cent.

COMMERCE

Search for new sources of energy

THE UN conference on new and renewable sources of energy at Nairobi was built up by the secretary-general of the conference, Mr Enrique Iglesias, as a momentous step as it was the first concerted global effort to plan a rational energy future for the world. The first week's deliberations of the conference, however, do not hold out such high hopes for the outcome of the conference, and newspaper reports have suggested hat, all the rich and poor nations have agreed to, is he need to end world dependence on oil and develop n array of alternative energy sources. The expected esponse from the developed countries to the current nergy crisis which faces the world and which will get ccentuated when the oil reserves run out has not been hat generous. True, Canada has pledged more than $1 illion over the next five years to energy development but, he richest country of the world, the United States of merica has promised no more than a doubling of the ilateral aid to more than $70 million in the next fiscal ear. It was immediately noted that the US contribu-ion would fall even short of the commitments by other estern nations to rectify the energy imbalance of rich nd poor nations. What is more the US has indicated hat it wants the private industry to play the major role n developing new energy sources on the plea that the rippling dependence on imported hydro-carbons must ot be replaced by a equally debilitating collection of ubsidised and uneconomic new and renewable energy rojects. The US is investing millions of dollars for the arnessing of solar energy in particular as well as deve-oping other new sources of energy but it does not want o share the fruits of its research and development reely even when warnings have been sounded that in e next two or three decades mankind will face an un-recedented challenge in meeting its energy require-ents. Obviously if the developing world has to share e benefits of their research, it will only be at a price hich the US private sector will dictate.

In her keynote address the Prime Minister Mrs ndira Gandhi, had called for a world policy on energy nd had underscored the need for an energy revolution. s she explained, the developed and developing coun-ies were in the same predicament, for better or worse d the challenge had to be accepted on a global basis. owards that objective, she proposed the creation of international consortium dedicated to mobilising bila-ral credit and aid from institutions and which would low for compact planning and monitoring of world ergy programme. It is uncertain whether the Nairobi ference will move in that direction particularly when e US has been lukewarm to such aid or sharing of benefits of research. The 'Nairobi Plan of Action' that is expected to emerge from the deliberations of the conference would perhaps contain nothing more than pious hopes unless during the second week of the deliberations (the conference concludes on August 21) awareness emerges that what the world is faced with is a common problem, not limited to the developing countries or developed countries.

In the immediate period ahead, however, the problem is of sharing of fossil fuels, particularly oil. It is conceded that technologies for harnessing of solar energy are to be refined and made cheaper if the common man has to benefit from them. Even in the case of bio-gas plants, as our experience shows even after setting up 80,000 of them, technical and sociological problems have to be solved if we are to set up community size plants. Organisational problems like collection of dung and community financing of the plants have to be studied. At the Nairobi conference, China announced ambitious plans to fuel millions of rural homes with bio-gas from living plants and animals, and we should profit by its experience. Whatever be the plans, there is no question of immediately switching over to these new sources of energy, and Mrs Gandhi and the Kenyan President, Mr Daniel arap Moi, did well to point out that this put into sharp focus the question of sharing of oil. As Mrs Gandhi emphasised the industrialised world must acknowledge its responsibility towards the developing world for which the problems must not be made more unbearable than they are at present. The Kenyan President came forward with the idea of dual pricing of oil to help the developing countries but this is not likely to be accepted by the Organisation of Petroleum Exporting Countries (OPEC), particularly when it has consistently opposed the suggestion in the past. It is doubtful if even the rich nations of the world would favour such a move. For them high prices of oil do not matter since they have been able to recover the higher price paid for oil through their exports of manufactured goods and arms to OPEC countries, of course, in the process making the plight of the non-oil developing countries much more difficult than what it would have been.

The Nairobi conference, serving as it will do as a vast clearing house of information, is more likely to bring home to the developing countries that they must first have national energy policies of their own. It is regrettable that even India, which is taking a leading part in the Nairobi conference, has no clearly defined energy policy even when expert committees and groups have drawn pointed attention of the Government to this lacuna. We have set up a Commission for Additional Sources of Energy without making sure that the existing sources are used judiciously. The Working Group on Energy Policy in its report submitted two years ago had called for curbs on oil consumption, conservation of energy through greater efficiency in utilisation and increased reliance on renewable sources of energy. We have made no progress in either of the directions. Even while laying emphasis on new and renewable sources the Sixth Plan provides not more than Rs 40 crores for this purpose, in addition Rs 10 crores for a project relating to magneto-hydro-dynamic power generation and other new technologies based on coal. It may be that this amount is almost ten times of what was spent in the earlier five years but the planning shows a lack of urgency. We should have time-bound programmes considering that the running out of oil reserves is only two or three decades away, and such a time-bound programme should have no constraints imposed on it by lack of resources. It is most painful that even where fuelwood on which the villagers depend for their energy is concerned, there is no ambitious programme drawn. The Sixth Plan has promised to spend Rs 50 crores on fuel and farm forestry. But there is no reference to building up the organisation that will be needed to implement a really ambitious fuel and farm forestry programme. The army, the village panchayats and voluntary organisations must all be mobilised for such a programme if the villagers are not to be starved of their fuelwood. At Nairobi, India, jointly with Kenya, has sponsored a resolution calling for acceleration of programmes of afforestation with a view to enhancing the availability of fuelwood and the plan seeks to achieve five-old increase in annual tree planting rate by the year 2000 AD. *Kubabul* promises to be a solution. At a recent seminar Mr B. B. Vohra, chairman, National Committee on Environmental Planning, had estimated that if the 48 million hectares of denuded forests forests and pastures and 40 million hectares of culturable wastes and fallows could be planted with *Kubabul*, an additional income of Rs 66,000 crores per annum could be generated. At least this would solve the fuelwood crisis that villages face if not the problem of poverty and unemployment.

Quarter century of engineering exports

THE growth in engineering exports is the logical corollary of the industrial diversification and growth that has taken place in the country in the wake of independence. The industrial development during the pre-Independence days was severely restricted by the negative attitude of the government of the day which frowned upon every initiative to secure industrial expansion and diversification. Under conditions of such stunted growth of industries, exports were naturally confined to primary produce like jute and tea and to some manufactured items like textiles, which the country could produce. It was not until planned development was under way that the diversification of exports through the inclusion of engineering goods could be achieved. At the beginning of the Second Five Year Plan, in 1956-57, the engineering exports totalled Rs 50 crores. Twentyfour years later, during 1980-81, the value of engineering exports rose up to an estimated Rs 900 crores or by 18 times. Over the same period the value of total exports of the country showed a rise of a little over ten times from Rs 604 crores during 1956-57 to an estimated Rs 6,500 crores during 1980-81. The engineering exports have thus shown a welcome dynamism to grow at a faster pace than exports in general.

No doubt the policies and actions of the government have played a vital role in this growth in engineering exports. The government has not only promoted the growth and diversification of industries but has also provided incentive for the growth in engineering exports. It set up the engineering export promotion council with the specific objective of boosting up the export of the products of engineering industries of the country.

The council helps Indian exporters through exploring the overseas markets and identifying items having export potential and providing market intelligence through market surveys or otherwise and promotes contact between Indian exporters and foreign buyers. Th council also helps the Indian exporters to move throug the growing complexities of international trade, advising them in procedures of GSP utilisation, and buyin practices of overseas countries, and arranging supply o indigenous and imported raw materials for expor promotion. The rise in the membership of the counci from 36 at the time of its establishment in 1956 to mor than 7000 in 1981 shows the rising strength of the engineering industries as also of the organised effort to promote the sale of engineering goods abroad.

There has been a welcome diversification in th components of engineering exports. While initially ligh engineering consumer goods only were being exporte now capital goods constitute a significant proportion (3 per cent) of these exports. India can export industria plant and machinery and projects in the field of civi engineering, textile, sugar, paper and paper industries electric power generation, transmission and distributio steel structurals, wagons and coaches, complete vehicles machine tools, coastal vessels and ships. Along wit the countries of South-east Asia, West Asia and Afric Indian engineering goods are now being purchased b the developed countries in Western Europe and Nort America, Japan, Australia and Newzealand. India firms are now in a position to provide consultancy, su ply know-how and technical and management service Indian firms are also setting up joint ventures in foreig countries. By the end of the eighties engineering e ports are expected to rise tenfold from Rs 900 crores i 1980-81 to Rs 9,000 crores in 1990-91.

While considering India's exports it is perhaps n out of place to note here that India's share in the world trade declined from 2.91 per cent in 1938 to 0.42 per cent in 1979. Further the decennial growth rate of India's total export trade was above the world level between 1938 and 1948 but has declined in the following decades. In other words the diversification of exports has not enabled India to retain her position in world trade, not to talk of improving it. This is undoubtedly disappointing. Particularly so, as it is recalled that the effective public cost of export promotion has been going up from year to year. The estimated public cost of export promotion (budgetary expenditure on trade and export promotion, fiscal support in the form of duty drawback, and cost of subsidised export credit) went up from Rs 110 crores during 1971-72 to Rs 626 crores during 1978-79. There has been a rising trend in the share of incentive-based exports in the total export trade of the country. If, nevertheless, India is not able to make its mark on the world trade front it requires some consideration. One reason perhaps lies in the fact that nearly one-half of the foreign technical collaboration agreements involve restrictive clauses on exports and the sectors of Indian industry that depend on foreign technological collaboration contribute a very small, almost insignificant part of India's export earnings. Moreover, there is not the desired readiness on the part of many exporters to work in a straightforward manner and there have been several reports of assistance for export promotion having been incorrectly or improperly appropriated by them.

Why not a metal bank ?

THE metal-based industries in India have now learnt to live with the shortages of basic non-ferrous metals. They have also accepted the fact that the country has inadequate ore resources, except in the case of aluminium, and thus they would have to depend on supply of imported metals through whatever source it comes. With prices of non-ferrous metals fluctuating widely both in India and abroad, and with supplies becoming uncertain, it is no surprise that the metal-based units are not in a position to plan their working efficietly. The need for having adequate stocks of metals with a view to ensuring their availability to consumers at reasonable prices, therefore, assumes importance. Against this background the Bombay Metal Exchange (BME) president, Mr S. N. Parikh's plea for creating a "metal bank" has not come a day too soon.

The need for creating buffer stocks of metals has been stressed on various occasions in the past, and it has been the pet topic of the presidents of BME and the Indian Non-ferrous Metals Manufacturers' Association (INFMMA), in their speeches at the annual meetings of these organisations. It may be mentioned that towards the end of 1978 the Union Government itself was contemplating creating a stockpile of metals to avert shortages, but nothing further was heard about the scheme. The idea would seem to have been dropped for all purposes, as the Union Commerce Minister, Mr Pranab Kumar Mukherjee, addressing the annual meeting of the INFMMA in September last year had turned down the plea for buffer stock of metals because one of the main problems with non-ferrous metals was wide fluctuations in international prices.

However, the Government could have certainly made a beginning when prices abroad were ruling low about two years ago and when the Government was in a position to spare enough foreign exchange for the purpose. For reasons known to it, the Government does not appear to have moved in that direction, even when the Committee on Controls and Subsidies had recommended building up buffer stocks of 20,000 tonnes of aluminium, 30,000 tonnes of copper and 25,000 tonnes of zinc. Only in the case of aluminium the Government chose to wake up rather late in the day when the shortage became acute in 1979-80 following drastic power cuts experienced by aluminium smelters and the Government was obliged to go in for huge imports at heavy costs.

While the present situation in aluminium points to plenty of supplies mainly as a result of poor off-take by electricity boards following paucity of funds, the position in regard to other metals continues to be far from happy. The gap between indigenous production and demand is widening. According to the Sixth Five Year Plan 1980-85, the gap is expected to widen from 61,200 tonnes, 62,300 tonnes and 32,600 tonnes, respectively, in 1979-80 in the case of copper, zinc and lead to as much as 70,000 tonnes, 65,000 tonnes and 35,000 tonnes by 1984-85. This gap will continue to widen beyond 1984-85 as the country's capacity of producing these metals continues to be limited by poor metal content of ores exploited and the chronic power shortage experienced by power-intensive smelters. According to the Planning Commission's estimates made early this year, the country will need to import 125,000 tonnes of copper, 50,000 tonnes of lead, 90,000 tonnes of zinc and 250,000 tonnes of aluminium by 1993. With shortfalls of such magnitudes staring in the face, it is time the Government should make a beginning at least now towards the goal of building up buffer stocks of metals. No doubt maintaining an inventory of costly metals would involve some expenses but these could be passed on to the consumers who should not grudge bearing them if they wish to have their requirements of metals regularly in a phased manner. Japan has been successfully operating buffer stock schemes for metals for years and there is no reason why India cannot do so.

LETTER FROM BRUSSELS

MALCOLM SUBHAN

MFA or imports at minimum prices?

THE MFA negotiations have got off to a slow start. The mid-July meeting of the Gatt Textiles Committee, which is the MFA negotiating forum, was especially disappointing for the roughly 25 developing exporting countries. They had come to Geneva prepared to negotiate, only to find that the EEC had no firm proposals to put before the Committee while the US had agreed, at the Community's request, to withhold its own detailed proposals.

It is unlikely the EEC will be ready to table its proposals at the five-day negotiating session scheduled for September 21. Although the Community Council of Ministers will be meeting here on September 15, it is not expected to adopt the more detailed negotiating mandate which the European Commission needs if it is to begin effectively to negotiate.

The fact is that the 10 member governments are divided. The Germans, Dutch and Danes believe the time has come for the EEC to return to the principles of free trade and liberalise textile imports. The Germans in fact have tended increasingly to disregard the import quotas set by the Community, much to the anger of their Common Market partners.

But three Community heavy weights—the UK, France and Italy—are pressing for more stringent controls on imports, especially from the low-cost countries. The Italians are not especially afraid of competition; their costs are the lowest in Western Europe for a wide range of knitwear. However, their Common Market partners tend to complain if they must absorb large amounts of imports from both the Far East *and* Italy.

The British Government is in something of a dilemma. It would like to remain faithful to its free trade principles but, faced with rising unemployment in Britain, it is pressing for tighter controls under the MFA (and also against Japanese cars for example). It is less vocal than in 1977, however, partly in order to avoid retaliation by developing countries (as happened last year when the Indonesians cancelled a number of contracts).

The most forthright in their demands for tighter controls are the French, whose textile industry has been hit by one factory closure after another. In the last few weeks the French Government has had to deal with the consequences of the collapse of the country's biggest textile group, Boussac-Saint Freres.

The company, which employs over 30,000 workers, is based in Lille, the town whose mayor was Pierre Mauroy, until he was appointed Prime Minister by President Mitterand. The French President, unlike President Reagan and Mrs Thatcher, is determined that the fight against unemployment shall have priority.

To this end he has opted for measures likely to give the quickest results, whatever their long-term implications. If the rising unemployment in the textile and clothing industries is due to cheap imports—and the country's powerful textile lobby is certain of this—then imports must be curbed.

Not surprisingly, the EEC's chief textile negotiator, Horst Krenzler, opened his formal statement to the Textiles Committee on July 14 with a reference to the situation in the Community's textile industry. He noted that the situation had not improved since 1977 and had even deteriorated in certain cases. He claimed that job losses had accelerated since 1980, and had been accompanied by a growing number of company closures.

EEC claims of a crisis in the textile industry have been rejected by the developing countries, however. And certainly the Community's own statistics do not bear out Mr Krenzler's statement to the Textile Committee.

Using 1975 as the reference year (1975 = 100) the production index for the EEC textile industry stood at 109 in 1979 and 106.5 in 1980. The corresponding indices for the clothing industry were 104.4 and 99—and for manufacturing industry as a whole 118 and 117. Production in the textile industry clearly has been rising, if at a slower rate than in manufacturing as a whole.

But the situation varies from country to country. The Italian textile and clothing industries in fact have even outperformed the manufacturing sector as a whole. The French textile industry has managed reasonably well, while its British counterpart has seen its output fall by some 20 per cent in relation to 1975. Production in the British clothing industry was rising, however, until last year, when the index fell to 95. (No figures are given for the French clothing industry.)

The Community's own statistics make it clear that there is no real crisis in the European textile and clothing industries. The job losses must be attributed to higher productivity—*i.e.* a steady restructuring of the industry. While registered unemployment has risen sharply in the last 18 months (and is still rising) it has involved the economy as a whole. Forcing the textile industry to keep on workers it does not need will only result in lower productivity—and reduced competitivity.

Even the British government recognises this. However, the textile lobbies, helped by the media, have succeeded in conveying the impression of an industry which has been undermined by cheap imports to the point where it will disappear in a cloud of dust (from falling factories) unless these imports are severely curtailed.

But some sectors of the industry are beginning to realise that the EEC may not be able to impose its wishes on the exporting countries as in 1977. As a result, alternative strategies are being canvassed, one of which envisages the scrapping of the MFA and its replacement by a system of minimum prices, to be operated by the Common Market countries themselves.

The idea—and it is no more than that at present—is French in origin and has received some support from clothing manufacturers in that country. It has no official backing, however, even in France. Textile federations in the EEC have had a look at the idea but for the present they remain committed to the MFA, suitably revised to accommodate their views, of course.

The idea cannot fail to appeal to them, however, as it offers a solution of breath-taking simplicity to the problem of low-cost imports. This is to subject all imports to a threshold, or minimum, price, and to refuse an import licence for products offered at lower prices.

Imports from the US would also be subject to minimum prices. The Americans could hardly object, it is pointed out, having led the way with their system of "trigger" prices for steel imports into the US.

SPECIAL ARTICLE

New technologies for rural development

By **ARVIND N. MAFATLAL**

THERE is no doubt that our primary concern is to manage our business and industry effectively to generate profits some of which could be utilised by the Government for planned development of the country. As long as 80 per cent of our people do not have the necessary purchasing power to utilise the products of our industry, we must realise there is a limit to the extent to which we ourselves can expand our business and industry. Therefore, it is also a matter of enlightened self-interest that we give urgent attention to helping the large section of our people who presently do not have the required income to go in for the products of industry.

Besides, rural development needs management input which we have developed in our industries and business. If this management input is effectively introduced into our rural development schemes, I am convinced it is possible to achieve more satisfying results and quickly too. Above all these is the modern concept of management which compels us to operate our industry and business within the enlarged framework of national and social objectives. Rural development has become an integral part of our business and industry. It is in this sense I feel that the FICCI has done a good job in organising this workshop to focus the attention of industry and businessmen and generally the urban sector on the imperative needs of rural areas.

No doubt, such workshops may have to be organised in Bombay or other cities in the country to ensure the presence of the urban elite and the workshop will serve to motivate them for dedication to the cause of rural development. But in all sincerity I would like to express here that it is extremely difficult, sitting and deliberating in urban centres like this, to perceive, let alone understand, what is urgently needed in rural areas, why people are poor and even getting poorer. It is only when we live amidst them, even for a day or two, that our genuine feelings of the heart get stirred and help to motivate us to work for the cause of the rural people.

In workshops like this we often deliberate, discuss and emphasise doing more of what is already being done — schools, hospitals, roads, drinking water wells, irrigation facilities, increase of fertiliser application, improved varieties of seeds etc. On the other hand, in such workshops, it is not possible for us to get an idea of the real impact of thirty years of development on our villages. Our rural people, particularly the rural poor, are still continuing to survive and struggle in a feudal and exploitative society and lead sub-human existence without satisfying even the barest minimum needs of food, clothing and shelter. Our priorities for the rural poor, I may emphasise here, have become distorted since we are looking at the villages as outsiders without understanding the conditions and minds of rural people. It is with this in mind, I am making the suggestion that such workshops be organised in rural areas particularly where new technologies are being developed for the benefit of the rural poor, and where significant development is taking place with the introduction of such technologies.

What are the priorities?

In my opinion, over 70 per cent of our population living in rural areas are the largest manpower resources. Over 48 per cent of these people, as per the estimates by the Planning Commission, are living below the poverty line. The programmes introduced so far, the technologies developed have benefited only a small section of these people. The majority of the people are still poor and their condition is growing worse. Unless we are clear about how these people can be helped to come up above the poverty level, we shall not be able to define the nature of training required for workers in rural areas. Let me first, therefore, mention briefly what is of urgent requirement in our country for the benefit of the rural poor and then suggest a few ways in which training of manpower can be improved upon and better organised.

The basic problem of rural poverty has been a situation of seasonal employment during busy season and lack of employment opportunities during lean period, compelling the weak groups to migrate or starve.

A well-planned strategy of rural development programme, which will enable the weaker sections of rural population to earn during the lean period, will provide a sound basis for sustained economic growth and rural prosperity. This plan has three facets of integrated rural development in the form of planned support. The immediate task is relief from hunger and disease and ignorance. The next phase is rehabilitation involving helping the rural people to develop productive assets. This is a joint enterprise of the Government, voluntary organisations and business community with the rural people as operating partners. It is only after the productive assets are developed, the rural poor become viable and their projects become economically feasible to go in for bank loans and other source of finance from outside. Thus, three phases in the development of rural people are to be clearly recognised — Relief, Rehabilitation and Development.

Mr Vadilal Dagli is on leave. His column *Editor's Notebook* will be resumed on his return from leave.

Simultaneously, with the recognition of these three phases of development, we should also recognise the three major inputs for helping the rural people to reach the stage of development. These are — modern technology (not western technology alone), motivation and management. Identification and training of manpower for the rural areas becomes more sharply focused around these two efforts of three phases for development and three inputs for development.

This is the text of the keynote address delivered by Mr Arvind N. Mafatlal, at the workshop on "Manpower for Rural Development — Its Mobilisation and Training", organised by Federation of Indian Chambers of Commerce and Industry in Bombay on August 13, 1981.

We have, during our over ten years of experience with our work in rural areas, been able to identify and understand these processes more clearly. Bharatiya Agro-Industries Foundation, with its foundation farm at Uruli Kanchan, has been developing some technologies which are relevant to the conditions in which the rural poor live. These conditions are poor soil, lack of water, uneconomic cow, and traditional crops with low yield potential under the uncertain and irregular rainfall. A crossbred cow produced from a local nondescript cow; fodder which can come up even with limited quantities of water; fruit, fibre and fuel plants cultivation instead of regular field crops; harvesting of whatever little quantity of water which the rain brings to the fields and conserving it in farm ponds — these are some of the components of the modern technology which are indigenous and not western. This technology is labour-intensive, less capital intensive, less management intensive, but suited to the present capabilities of farmer, and also capable of being developed with the farmers' involvement and with the help of training facilities which could be organised for their benefit from outside.

These technologies, when fully implemented, can generate a net income of about Rs 4,500 to Rs 5,000 per year per family on one acre of land. Messrs National Organic Chemical Industries Ltd, has recently developed a technology, viz NFI (Nocil Film Technique), which promises even larger incomes in smaller area and with very little quantity of water. It has been possible for us to concentrate and develop these technologies because of our commitment to the rural poor and to help them earn an income which will take them above the poverty level.

For want of time I am not able, on this occasion, to furnish you with more details of the projects which we have introduced in Gujarat, Maharashtra, Madhya Pradesh, Uttar Pradesh and Orissa. I would, therefore, like to make humble suggestion that the next workshop may be organised in Chitrakoot where you will be able to see for yourself the technologies developed and introduced, the way motivation of rural people is being attempted through the three-tier medical and health care delivery system, and the management input supplied by Mafatlal Industries Ltd. You will also see the way in which our two companies, viz, National Organic Chemical Industries Ltd and Polyolefins Industries Ltd are reorienting their R & D work and relating themselves to be of relevance to the needs of the poorest people. I am quite sure, you will all benefit by visiting Chitrakoot for a day or two.

Training centres

I hope, you will now appreciate my earlier statement that unless the technologies and methods of work for immediate benefit to the rural poor are developed and introduced, training of rural workers will not have much meaning. No doubt, Government has introduced a number of training programmes since the starting of community development projects in 1952. More recently, we have seen the introduction and operation of TRYSEM (Training of Rural Youth for Self Employment). The Central Government has also been the source of inspiration for starting a number of polytechnics in rural areas. The Indian Council of Agricultural Research has been instrumental in starting *Krishi Vigyan Kendras* all over the country. A number of secondary schools and colleges are now operating in the rural areas. Besides these, there are a number of gram sevaks training centres, gram sevikas training centres, farmers' training centres etc. We should stop and look at the impact of these institutions in enriching the rural life. It is the common knowledge that most of the young persons coming through these institutions, particularly the colleges, schools, polytechnics etc, enter into the job market in urban centres, because their educational pattern has not been able to expose them to the immense potentialities in the rural areas and the relevant technologies which could be utilised by them for their own production and profitable employment in rural areas.

Even the formal and non-formal training programmes for the rural people have been mostly emphasising the traditional scientific methods. These are of course of benefit to the people who have larger holdings and who are already above the poverty line. All these institutions require a new orientation. They should be primarily redeveloped to meet the needs of the people in the local areas. Rural polytechnics can be instrumental in developing the tools and skills which would benefit the rural masses. They can start production wings either directly as an integral part of their institution or as a separate institution and which can supply the requirements of that particular area. I understand that the Union Ministry of education has promoted community polytechnics in recent years. This is an encouraging development. If these polytechnics relate their production programme to the improvement of life in the rural area around, it can be the beginning of a new phase of integration of the Polytechnics with the community. The training programme and the educational pattern will automatically get reoriented to the needs of rural areas.

Energy

Recently there has been a great deal of emphasis of energy plantation. This is rightly so in view of the increasing shortage of power, and the need to mobilise the renewable sources of energy. We have a variety — Hawaiian Giant — which is a wonder plant. It can grow in any type of soil with minimum quantity of water. One can harvest at the end of three to four years and earn an income which is twice or thrice that of income through regular field crops. Agro forestry, utilising plants like Hawaiian Giant, can be taken up in most of our waste lands, hill slopes and degraded forest lands. Village schools can also play an important role in developing these plantations and earn a sizable income both to the school and to the students. Similarly, unemployed rural youth can take this up as an enterprise and earn sizable income to lead a satisfying life. Training in this technology can contribute effectively to develop the economic resources of rural areas.

I would like to mention one more matter in this connection. There has been a tendency for migration of rural people and rural talents to urban areas. This applied to workers also. This cannot be reversed merely by directions. Unless rural areas provide challenging and satisfying opportunities, nobody will be attracted, much less motivated, to stay back and work. I am now convinced that there are people who are dedicated and sincere enough to go and stay and work in the villages. These people need opportunities. Opportunities can be created when relevant technologies and progammes are undertaken in villages, management input introduced. It is for this reason, I have been always saying that there should be co-ordination among the institutions developing rural technologies, voluntary organisations providing motivational force and business and industry providing the management input.

COVER STORY

Reviving sick industries: At what cost?

By **COMMERCE RESEARCH BUREAU**

THE phenomenon of industrial sickness appears to have become increasingly common in the last few years. Industrial units both in the large and the small-scale sectors are reported to have been gripped by the sickness. While such sickness in industry may arise on account of various reasons, the common effects of such sickness are hardship and unemployment for labour engaged in the industrial units and waste of national resources. It should, therefore, be considered essential not only to devise suitable means for dealing effectively with sick industrial units but also to set up suitable arrangements for monitoring and detecting industrial sickness at an early stage.

Normally, the management of industrial undertakings should be considered primarily responsible for sound and honest management of the undertaking and for prevention of sickness. However, when the management is either unwilling or unable to perform its role, the Government and the financial institutions have to intervene to fulfill their larger social responsibility of protecting employment and ensuring efficient use of national resources.

The data availability position regarding industrial sickness is itself far from healthy. It is unfortunate that the Union Government and the Union Industry Ministry appear to have abjured their responsibility of collecting detailed statistics on sickness in Indian industry. No doubt, the Reserve Bank of India (RBI) does collect some data on the subject, but that it does from a limited point of view—that of monetary involvement of banks in these units. These data do not indicate the actual or the likely loss of employment and output arising out of the sickness of the industrial units.

Dimensions of sickness

In 1976, the RBI defined a sick unit as one which incurred a cash loss for one year and, in the judgement of its bankers, was likely to incur such losses in the next two years and consequently had a worsening debt-equity ratio.

According to the RBI's *Report on Currency and Finance* 1979-80, there were 325 large and medium scale industrial units at the end of June 1978, each of which had availed of bank credit of rupees one crore and above and which had been classified by the RBI as sick. The amount of bank credit locked up in and outstanding against them at the end of June 1978 was Rs 956 crores. By the end of June 1979, the number of such sick industrial units had gone up to 345 and the amount of bank credit outstanding against these units had increased to Rs 1,102 crores. According to the information given in Rajya Sabha, by the end of December 1979, the number of such sick units and the amount of credit outstanding against them had gone up further to 378 and Rs 1,158 crores respectively (Table 1).

In addition to the sick large and medium scale units, the number of sick small scale units had gone up from 16,805 at the end of June 1979 to 20,975 at the end of December 1979 and the outstanding bank credit had increased from Rs 181 crores at the end of June 1979 to Rs 262 crores at the end of December 1979.

Thus, taking both the large and medium scale sector and the small scale sector together, it can be seen that the total number of sick industrial units in the economy rose from 17,150 at the end of June 1979 to 21,353 at the end of December 1979. The total amount of bank credit outstanding against sick units rose from Rs 1,283 crores at the end of June 1979 to Rs 1,420 crores at the end of December 1979.

COVER STORY

The industrywise break-up of sick large and medium scale units shows that units belonging to five industry groups—engineering, cotton textiles, chemicals, sugar and jute textiles— account for the major share of bank credit locked up in such sick units. Of the total credit locked up in sick large and medium units, those belonging to these five industry groups accounted for 86.1 per cent at the end of June 1978, 86.3 per cent at the end of June 1979 and 86.1 per cent at the end of December 1979. Even within these five industry groups, units belonging to engineering and cotton textile groups accounted for more than 50 per cent of the total credit amount outstanding against all sick large and medium scale industrial units as on these three dates.

The statewise break-up of sick large and medium scale units shows that six states—West Bengal, Maharashtra, Tamil Nadu, Gujarat, Uttar Pradesh and Karnataka—account for the major share of bank credit outstanding against such units. As at the end of June 1978, June 1979 and December 1979, these six states accounted for more than 80 per cent of the credit outstanding against such sick units. And even within these six states, the three states of West Bengal, Maharashtra and Tamil Nadu accounted for more than 60 per cent of outstanding credit as on these three dates (Table 2).

The statewise distribution of sick small scale sector units shows that at the end of December 1979, West Bengal had the highest number of such units followed by Maharashtra, Andhra Pradesh, Uttar Pradesh, Karnataka and Assam in that order (Table 3). Tamil Nadu, Gujarat, Bihar and Orissa also had sizable number of sick small scale units at the end of December 1979.

Given these dimensions of industrial sickness, what have been the causes that led to this situation? Several committees at the levels of the Centre, states, financial institutions and industrial associations have time and again diagnosed the causes of industrial sickness. In general, these causes include: incompetent and dishonest management, financial indiscipline, old and worn out machines, technical obsolescence, demand constraints, labour relation problems and shortages of inputs.

The policy measures evolved to cure industrial sickness could be put at different levels—at the levels of the Union Government, the Reserve Bank of India, the Industrial Development Bank of India and the Industrial Reconstruction Corporation of India.

Policy measures of the Union Government

With a view of reviving sick industrial units, the Union Government evolved in 1977 a scheme of merger of sick units with healthy ones. In the Finance Act, 1977, the Union Government introduced certain fiscal concessions under Section 72-A of the Income Tax Act whereby a healthy unit taking over a sick company was allowed to carry forward and set off the accumulated losses and unabsorbed depreciation of the latter against its own tax incidence. However, it was stipulated that company mergers eligible for the concession should be in the 'public interest'. In respect of amalgamations mooted by MRTP companies, the requirement was an 'overwhelming public interest'.

Three conditions pertaining to 'overwhelming public interest' were:

1. The amalgamated company should have experience of manufacturing the same products which were produced by the sick unit proposed to be taken over by it.

2. The sick company considered for merger with a healthy unit should belong to an industry suffering from widespread and chronic sickness.

3. There must be a 'demonstrable' gain to public interest through the proposed merger.

It was further required that (1) the sick company taken over should have employed staff numbering more than 100 and (2) it should have assets of more than Rs 50 lakhs. These two conditions were applicable to both MRTP and non-MRTP companies.

In view of the tardy progress of company take-overs under the scheme, the Union Government decided in September 1980 to withdraw all these conditions.

The liberalisation led to more expeditious clearance of merger proposals, considering that while between 1978 and September 1980, only 16 schemes had been approved, between September, 1980 and June 1981 the number of approvals was 25.

Until August, 1979, the Govern-

SOURCES: As per Table I

ment did not allow amalgamations of inter-connected companies or subsidiaries with their principal units. It took the view that such mergers went against the basic objectives of the policy relaxation under section 72-A.

But in August, 1979, in a bid to make the scheme more attractive, it decided to throw open the tax concession also to companies merging with their subsidiaries or inter-connected units.

The policy on sick industries recognised that the revival of a sick unit cannot be the responsibility of any single agency and that it can be achieved effectively only by a sharing of the responsibility by Central Government, state governments, financial institutions, banks and the management itself. The policy stated that closer and more vigilant involvement of financial institutions in units with management of doubtful competence or integrity would be essential. For this purpose the policy statement announced that a group of professional directors would be set up jointly by financial institutions. This group was expected to report to the financial institutions on measures that should be taken to prevent industrial sickness.

In the case of industrial units which were already sick the policy advocated rehabilitation through joint efforts of state governments and financial institutions who were to provide financial and managerial support with suitable restructuring of the management. It also announced that proposals for the merger of sick units with healthy ones would be examined by special authority under the Income Tax Act of 1961. It was only when these courses of action failed that steps under the Industries (Development and Regulation) Act would be considered.

In order to examine all the alternative courses of action and to decide on the most suitable measures the policy statement proposed to set up a screening committee under the chairmanship of Secretary, Industrial Development with representatives of the finance ministry, Reserve Bank of India and financial institutions.

A major decision that the 1978 policy statement announced was not to return to the same management a sick undertaking the management of which had been taken over under Industries (Development and Regulation) Act.

New strategy

A new strategy for sick units was evolved by the Union Industry Ministry in the last week of June 1981. This three-pronged strategy aims at preventing sickness in industry, quick rehabilitation of units that go red and an early decision on the future of such units. A three-member cabinet committee, consisting of the Union Finance Minister, the Union Commerce Minister and the Union Minister of State for Industry, was asked to scrutinise this strategy. Nothing has been heard of it since then.

A major plank of this new strategy is the provision that units employing over 1,000 persons or having an investment of Rs 9 crores or more in fixed assets should be nationalised, if the Reserve Bank of India, the financial institutions or the state governments are unable to contain the growing sickness in the sick unit.

This would, however, be subject to three further considerations. A sick unit would be nationalised provided that (a) the line of production is critical to the economy; (b) the unit has been functioning as mother unit with large ancillary linkages; and (c) its closure would cause substantial dislocation and throw out of employment such a large number of persons that it would not be possible to provide alternative jobs to them.

The Union Industry Ministry also cautioned that it would not be desirable to nationalise a unit which is inherently non-viable. The new strategy has therefore emphasised the need for the concerned administrative ministry to satisfy itself regarding the viability of the unit before a decision is taken to nationalise it. An examination of these broad features of the new strategy aimed at curing the industrial sickness reveals that it completely leaves out small scale sector units from its scope. even though the incidence of sickness among these units is by no means insignificant.

Role of Reserve Bank

The RBI has created a Sick Industrial Undertaking Cell in its Department of Banking Operations and Development (DBOD). This cell has been closely monitoring banks' performance in identifying sick units and taking remedial measures. In 1979, it undertook studies of the organisational set up in banks for monitoring sick units. Besides, to ensure that rehabilitation programmes of sick units are prepared and implemented properly, the cell has been convening meetings of various financial institutions and borrowers. The cell also looks into the progress made by the sick units.

At the end of June 1979, the banks had completed viability studies in respect of 182 units out of the 345 industrial units identified as sick. It was found that 155 units with outstanding bank credit of Rs 604.54 crores were viable.

The Reserve Bank has also recently constituted a committee under the chairmanship of Mr T. Tiwari (chairman, Industrial Reconstruction Corporation of India) to examine the legal and other difficulties faced by banks and financial institutions in the rehabilitation of sick industrial undertakings and to suggest remedial measures including changes in law.

To the complaint that banks as well as the RBI have been allegedly lukewarm in reviving sick units, the Reserve Bank of India reply seems to be. "If rehabilitation programme had to be taken up mainly on socio-economic considerations, it was necessary that equitable sacrifice was made by each bank/financial institution as also by the

owners of the units, other creditors, government, labour etc." (*Report on Currency and Finance* 1979-80). It is doubtful whether a committee of the Reserve Bank's own choice will come out with anything contrary to its known views.

Soft loan scheme

The soft loan scheme was introduced in November 1976 for financing the modernisation programmes of five selected industries, namely cotton textiles, jute, cement, sugar and specified engineering industries. The main objective of the scheme was to enable industrial units in these five groups to overcome the backlog in modernisation, replacement and renovation of plant and machinery, so as to achieve higher and more economic levels of production and thereby improve their competitiveness in the domestic and international markets. The scheme aimed at fuller utilisation of installed capacities with minimum capital cost, did not contemplate either the wholesale replacement of existing assets or providing assistance to units which were sick or closed down. The role of the scheme as regards the sickness was preventive rather than curative.

The scheme was operated by the IDBI with participation of IFCI and ICICI. The overall responsibility for operating the scheme was vested in IDBI. IFCI was the lead institution for jute and sugar industries, ICICI for engineering industries and IDBI for cotton textiles and cement industries.

As compared to normal term loan assistance from financial institutions, loans under the soft loan scheme were extended on concessional terms, not only in regard to the rate of interest but also in regard to other provisions such as the promoter's contribution, debt-equity ratio, initial moratorium and repayment period. In pursuance of the decision taken by the Union Government in November 1977, loans under this scheme were exempted from the convertibility stipulation.

Under the soft loan scheme, 369 applications were received by the end of June 1980 (after adjusting for proposals rejected, withdrawn or closed), with an amount of Rs 826 crores. Out of them, 341 applications with an amount of Rs 551 crores had been sanctioned by that date. Only Rs 190 crores had however been actually disbursed, pertaining to 194 applications At the end of June 1980, 28 applications were pending for an amount of Rs 65 crores.

Of the total number of applications for soft loan received till the end of June 1980, textile industry had the highest number of applications at 226, followed by engineering industry at 86, sugar at 23, jute at 20 and cement at 14. In terms of amount of soft loan applied for, textiles industry had the highest share (Rs 483 crores) followed by engineering (Rs 153 crores), cement (Rs 79 crores), jute (Rs 61 crores) and sugar (Rs 50 crores) (Table 4).

The actual disbursement under the soft loan scheme amounted to Rs 189.9 crores as at the end of June 1980. Of this, textile industry received the highest amount of Rs 89.9 crores followed by cement industry (Rs 39.1 crores), engineering industry (Rs 36.1 crores), sugar industry (Rs 20.9 crores) and jute industry (Rs 3.9 crores).

The units under the soft loan scheme were being classified as 'weak' 'not so weak' and 'better off' units to determine which rate from among the three-tier structure of interest rates should be applicable to which units. 'Weak' units were defined as those in respect of which erosion in paid-up capital and reserves was above 50 per cent, not so 'weak' units as those in respect of which such erosion was up to 50 per cent and better off units as those without such erosion. The entire assistance to 'weak units' was given at the concessional rate of 7.5 per cent while the concessional part of the assistance would get reduced in the case of "not so weak" and "better off" units on a grading scale, depending upon the financial position of the units.

Till the end of June 1980, the financial institutions had extended soft loans of Rs 275.9 crores at the concessional rate of 7.5 per cent per annum, Rs 36.8 crores at the rate of 9.5 per cent per annum and Rs 238.3 crores at 11 per cent per annum, resulting in a weighted average interest rate of 9.1 per cent per annum.

Beginning with March 1980, the three-tier structure of interest rates under the scheme had been changed to a two-tier structure under which the soft and normal components carry interest at 7.5 per cent and 11 per cent respectively. Besides, it was also decided that the lending rate applicable to the soft component where it exceeds 20 per cent of the respective loan should be reviewed after two to three years in each case so as to ensure that the concessional element is kept to the minimum, and only to the extent needed, *i.e.* till such time the units can bear the normal rate of interest.

In 1981, it was decided to extend the facility of loans for modernisation programmes to all industries, instead of

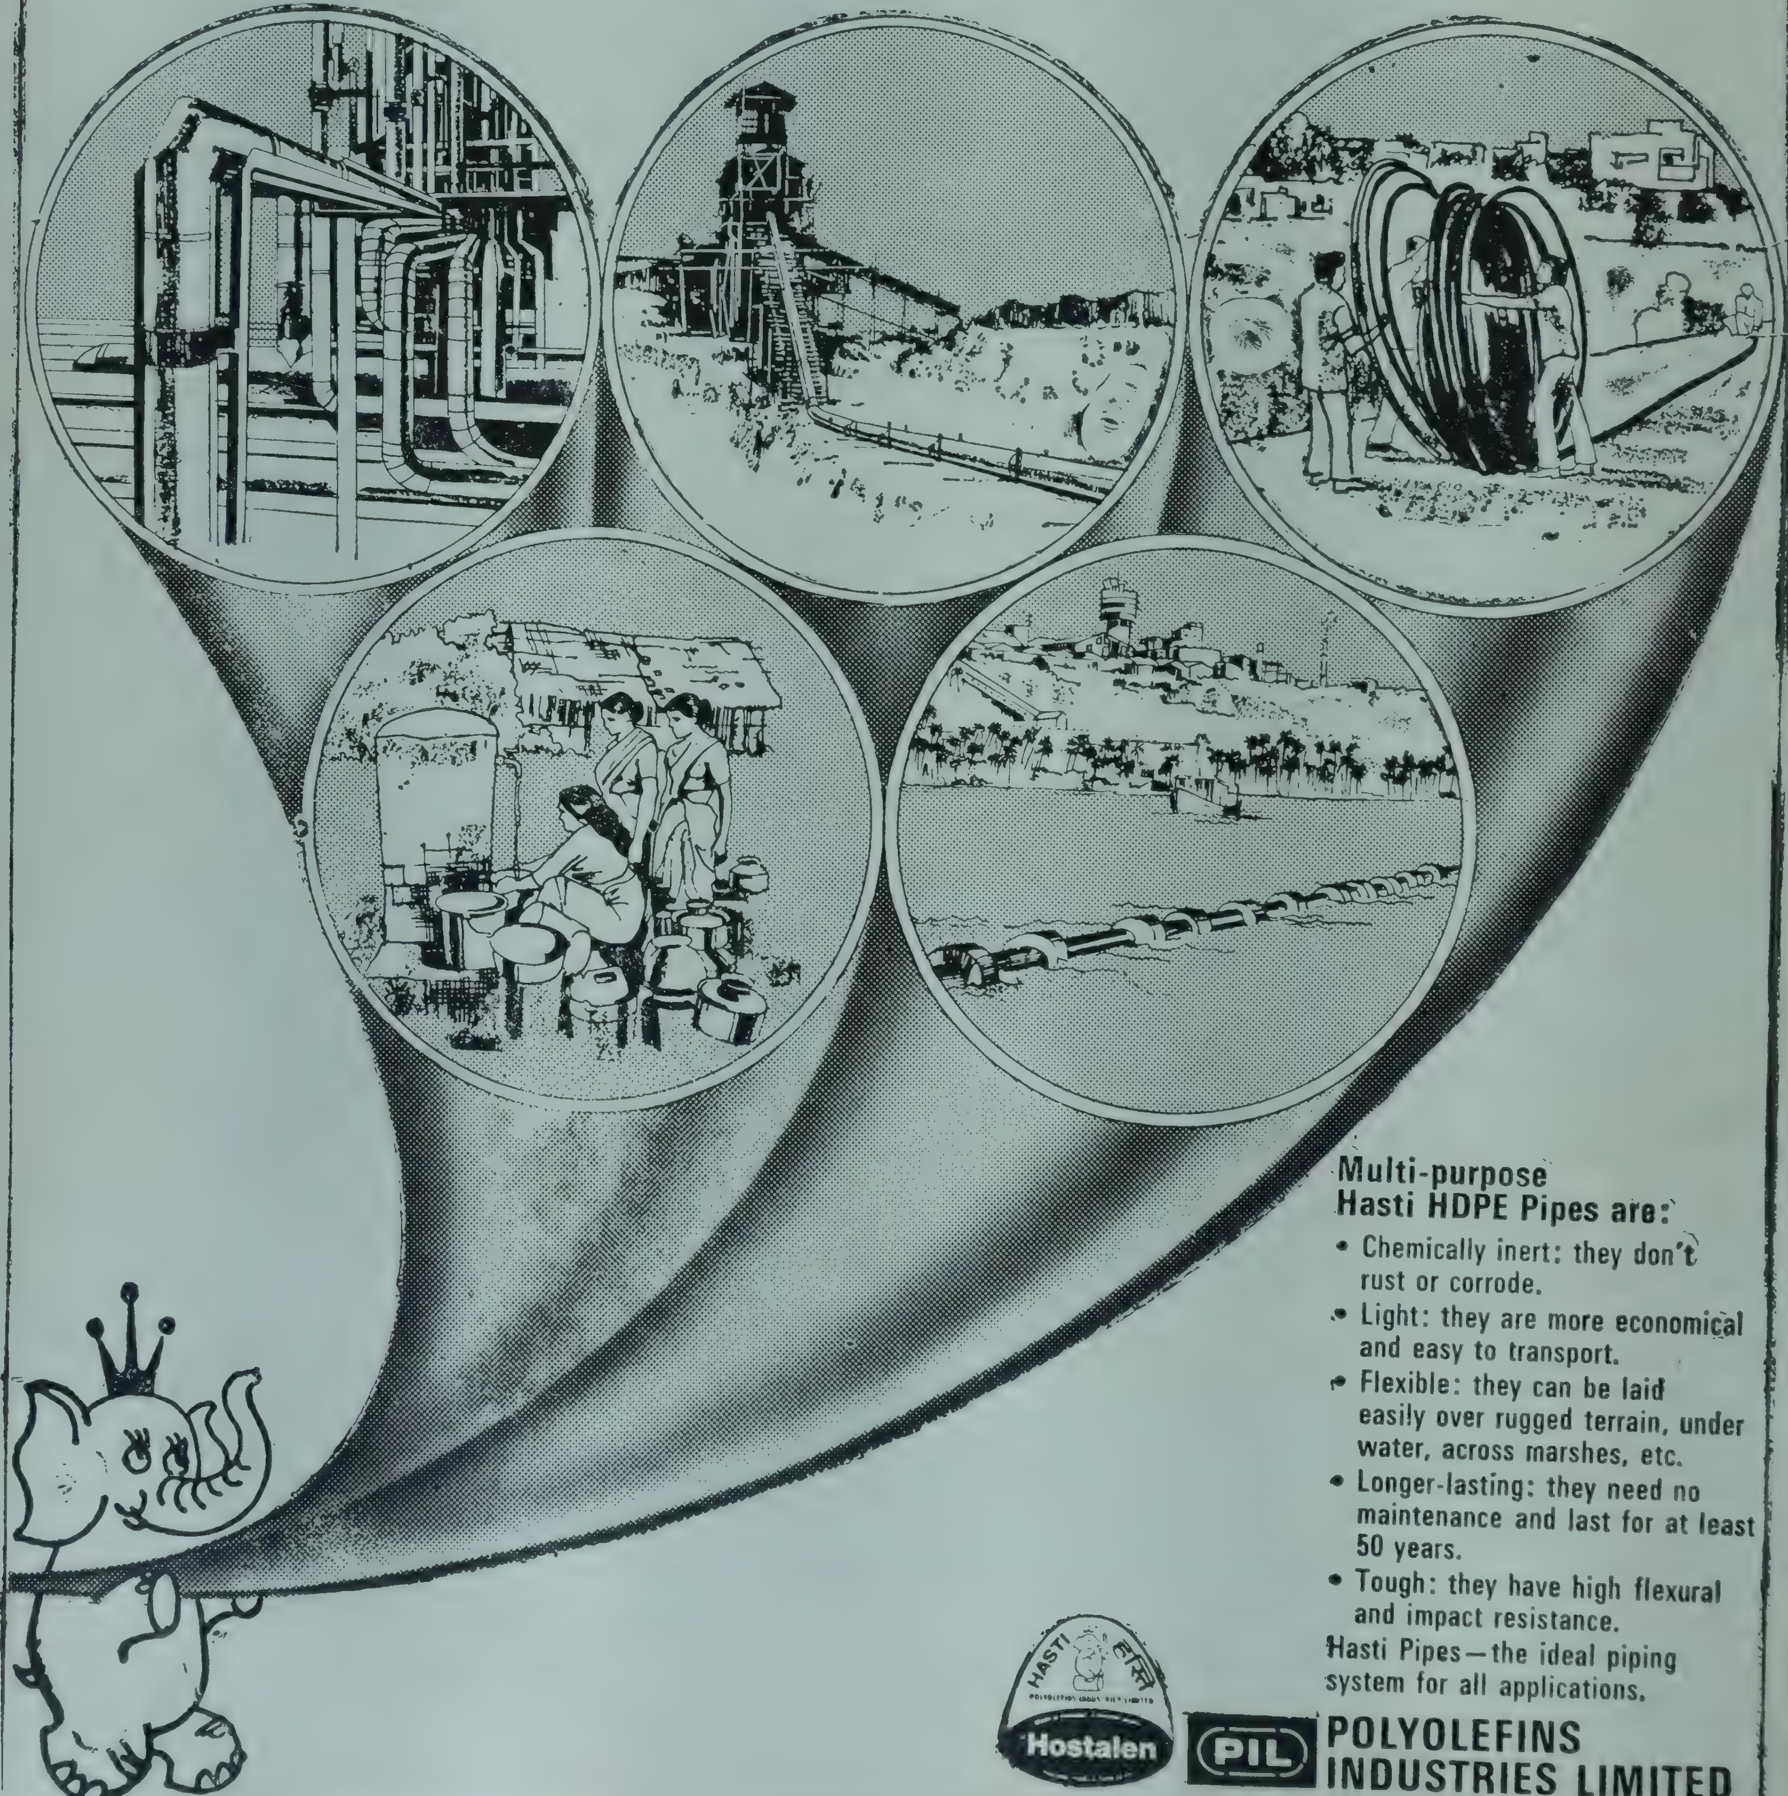
HASTI HDPE PIPES
are ideal for anything that flows.



**Multi-purpose
Hasti HDPE Pipes are:**

- Chemically inert: they don't rust or corrode.
- Light: they are more economical and easy to transport.
- Flexible: they can be laid easily over rugged terrain, under water, across marshes, etc.
- Longer-lasting: they need no maintenance and last for at least 50 years.
- Tough: they have high flexural and impact resistance.

Hasti Pipes—the ideal piping system for all applications.

only five as hitherto, but at normal rates of interest. These loans would continue to be exempt from convertibility stipulation.

IDBI: Rehabilitation finance

The Rehabilitation Finance Division (RFD), created by the IDBI, plays an important role in matters of surveillance of the performance of the sick units as also their rehabilitation. In fact, from 1978-79, a separate cell in the RFD started processing references emanating from banks and other financial institutions regarding sick units in their portfolio.

However, quite a few problems—administrative and bureaucratic—appear to be preventing the revival efforts from succeeding fully. Mr R. K. Talwar, the then chairman, IDBI, stated in his annual speech for 1979-80.

"It is often an uphill task to secure the consent of all the parties concerned to the package of revival measures formulated by IDBI. Even where a general consensus is reached at joint meetings, it takes several weeks or months before the consensus is reflected in formal decisions. The efficiency of the rehabilitation measures depends greatly upon the expedition and faith with which they are implemented. The delays may also arise because of differences between financial institutions and commercial banks. The solution lies in looking at the issues in the broad perspective of the banking system, which is mostly owned by the government. All that is necessary is a code of understanding among the commercial banks in order to avoid delay in implementing consortium decisions. As of now, this is an area of irritating bottlenecks".

Role of IRCI

In 1971-72, Industrial Reconstruction Corporation of India Ltd, (IRCI) was incorporated, with one of the objectives being to promote and operate schemes for industrial development of the country and in particular for the rehabilitation of industrial concerns. To achieve the task of reconstruction and the nursing of sick units back to health, the IRCI has adopted a two-pronged, strategy: to introduce professional management on modern lines in the units concerned; and to create a proper management outlook having regard to the social climate in which managements have to function. (See separate article on IRCI in this issue).

The central objective of IRCI is the revival and rehabilitation of sick and closed industries. The amount of loans sanctioned and disbursed by IRCI till the end of June 1980 amounted to Rs 80.41 crores pertaining to 94 units and Rs 69.87 crores pertaining to 92 units respectively. Rubber products as an industry group accounted for the highest amount of loan sanctioned (Rs 15.85 crores) followed by metal products (Rs 10.80 crores) and bicycles and accessories (Rs 10.55 crores). Among the industry groups for which loans were disbursed, rubber products accounted for the highest amount (Rs 15.10 crores) followed by bicycles and accessories (Rs 9.58 crores) and metal product (Rs 9 crores) (Table 5).

The purposewise break-up of loans sanctioned indicates that the highest amount was sanctioned for meeting the resource gap (Rs 26.76 crores) followed by that for margin money (Rs 19.96 crores), expansion and diversification (Rs 16.09 crores) and repayment of previous liabilities (Rs 10.35 crores). A similar break-up for disbursement reveals that the highest amount was for meeting resource gap (Rs 24.30 crores), followed by that for margin money (Rs 19.03 crores), expansion and diversification (Rs 10.78 crores) and repayment of previous liabilities (Rs 8.72 crores). The balances of sanctions and disbursements were for other purposes.

West Bengal accounted for the highest amount of loan sanctioned (Rs 69.81 crores) and disbursed (Rs 60.87 crores) followed by Maharashtra (Rs 4.76 crores and Rs 4.69 crores) (Table 6)

Revival: At what cost?

It is apparent from a review of measures taken to revive sick industrial units that a sizable amount of resources is being spent for the revival of these units by different bodies. While this may be unavoidable in view of the dimensions of the problem, the larger question that arises here is: What is the real cost of all these efforts? Are we going to evaluate these efforts in

COVER STORY

terms of a cost benefit framework? Or are we going to treat the amount of resources spent on the revival measures as charity and therefore beyond questioning? At a time when the national economy is suffering from a poor management of resources, do we want to throw good money after bad in our efforts to revive sick units without a critical evaluation? Unless the cost of these resources is analysed in terms of the benefits derived therefrom, a doubt would persist that the national resources are being wasted away.

Besides, the Union Government is believed to be toying with the idea of exempting the management of sick units from the provisions of the Minimum Wages Act. In fact, one of the terms of reference of the committee set up by the RBI under the chairmanship of Mr T. Tiwari is to examine whether the sick units should be burdened with obligations like payment of minimum bonus and implementation of various wage awards, which may be having adverse effects on the rehabilitation programme. This should be regarded as the most shocking development. The purpose of all efforts aimed at reviving the sick industrial units is to protect employment. It is for this purpose that sizable amount of resources have been spent so far in this direction. The latest policy measure under consideration of the Union Government would be completely contrary to this objective. It would inspire the management of sick units after their nationalisation to give up all responsibility towards labour. When the Union Government does not allow management of private sector units to be so irresponsible, how can it take up such power and exempt units under its own management from provisions relating to labour welfare is beyond anybody's grasp.

IRCI

Growing burden of overdues

By COMMERCE RESEARCH BUREAU

THE Industrial Reconstruction Corporation of India Ltd (IRCI) was established in April 1971 as a specialised financial institution to provide financial assistance for the reconstruction and rehabilitation of sick industrial units. The IRCI was jointly promoted by the Industrial Development Bank of India (IDBI), the Industrial Finance Corporation of India (IFCI), the Industrial Credit and Investment Corporation of India Ltd (ICICI), the Life Insurance Corporation of India (LIC), the State Bank of India (SBI) and nationalised banks. The present chairman of the corporation is Mr T. Tiwari.

In regard to the corporation's sphere of activities, in the initial stages, its operations were confined mostly to the eastern regions of the country, particularly West Bengal, which had many sick industrial units in the early seventies. However, by the close of June 1980, the activities of IRCI had spread far and wide so as to cover the states of Andhra Pradesh, Gujarat, Haryana, Karnataka, Kerala, Maharashtra, Punjab, Tamil Nadu and Uttar Pradesh and Union Territory of Delhi.

During 1980, IRCI, adopted a new strategy for revamping sick units. It was also proposed to work out a basic minimum programme of renovation and modernisation with newer processes and techniques for each unit under its care. Further in an effort to break through various operational difficulties found with sick companies, which had a greatly distorted debt-equity picture, the corporation had undertaken restructuring of the capital of some selected sick units.

By the end of June 1980 the total financial assistance sanctioned by the corporation, net of cancellations to 94 sick industrial units amounted to Rs 78.3 crores as compared with Rs 64.6 crores to 96 units at the end of June 1979. The corporation keeps a close watch on the utilisation of the disbursed funds by the units under the specific heads for which the assistance is sanctioned. The cumulative term loan disbursements at the end of June 1980 aggregated Rs 68.3 crores to 92 industrial units against Rs 55 crores to 91 units at the close of June 1979. The total disbursements was 87 per cent of the total sanctions, as compared to 85 per cent at the end of June 1979.

The industries assisted by the corporation cover a fairly wide range, and are broadly classified into nine groups—namely (1) food manufacturing, (2) textiles—cotton and jute, (3) rubber products, (4) chemicals and pharma-

ceuticals, (5) metal products, (6) machinery (except electrical), (7) electrical machinery/equipment, (8) transport equipment (including bicycles), and (9) other industries including ceramics, leather, printing, etc.

During 1979-80, the IRCI received a total of 809 proposals for reconstruction assistance. Of these 166 proposals were sanctioned. Reconstruction assistance (gross) worth Rs 14.1 crores (Rs 11.4 crores in 1978-79) in the form of term loans was sanctioned by the IRCI to 37 industrial units.

The data relating to purpose-wise, state-wise and industry-wise distribution of loans sanctioned and disbursed by IRCI since its inception till the year ended June 1980 showed that of Rs 69.9 crores disbursed, the largest amount (Rs 24.3 crores or 34.8 per cent of the total) had been for meeting the resource gap. The second largest amount (Rs 19.0 crores or 27.2 per cent of the total) was disbursed for the purpose of meeting the margin money working capital requirement. Next in order came the disbursement for meeting expansion/renovation/balancing equipment/diversification needs (Rs 10.8 crores or 15.4 per cent).

Tables 1 and 2 present a detailed picture of the statewise and industrywise distribution of loans sanctioned and disbursed by the IRCI as at the close of June 30, 1980.

The operational strategies of the IRCI lay emphasis on selectivity of the units to be taken up for assistance based on the prospects of their long-term viability, the need for the restructuring of capital and liabilities of the units, strengthening of the management set up, and securing corporate support from public sector undertakings engaged in related areas.

In 1979-80, the rate of interest on loans directly disbursed by the Corporation was 8.5 per cent. The concessional rate for small-scale units and for units situated in backward areas was 7.5 per cent and 7 per cent respectively.

In 1973, the corporation, along with IDBI, other financial institutions and banks, promoted the Textile Processing Corporation of India Ltd (TPCI) for providing facilities for textile processing. The TPCI began its operations in 1976-77. TPCI's sales value increased from Rs 40.1 lakhs in 1977-78 to Rs 88.6 lakhs in 1978-79 and Rs 88.2 lakhs in 1979-80. However, it incurred a loss of Rs 46.8 lakhs in 1979-80 against losses of Rs 44.2 lakhs in 1978-79 and of Rs 55.4 lakhs in 1977-78. During 1979-80, a sum of Rs 18 lakhs was sanctioned to TPCI by the IRCI for purchase of diesel generating sets.

Finances : The paid-up capital of the corporation as at the end of June 30, 1980 was Rs 15 crores. Its market borrowings till the end of June 1980 amounted to Rs 21.7 crores. The Central Government granted a loan of Rs 10 crores during the year ended June 1980; the interest on this is eligible for subsidy from the Central Government. The total borrowings from the Central Government (inclusive of initial interest free loan of Rs 10 crores) as at the

Table 2 : Industrywise distribution of loans sanctioned and disbursed by IRCI as on June 30, 1980

(Rs lakhs)

Sl. No.	Industry group	Loans sanctioned (Effective)			Loans disbursed*

Notes : Loan assistance includes term loan as well as hire-purchase assistance.

@ Does not include a Haryana based unit to which the Corporation has issued a guarantee but no loan.

* An amount of Rs. 680.97 lakhs has been repaid by 31 units.

** Includes debentures of Rs. 9.95 lakhs.

close of June 1980, stood at Rs 36.5 crores.

The Corporation's operations during the year ended June 1980 resulted in a reduced net loss of Rs 18.84 lakhs (after making a provision of Rs 43.0 lakhs towards bad and doubtful debts), as compared to the net loss of Rs 46.5 lakhs in the previous year.

Loan recovery

As at the close of June 30, 1980, cumulative instalment of loans due for recovery by the corporation amounted to Rs 13.35 crores, of which an amount of Rs 72 lakhs was recovered. Apart from this, a sum of Rs 3.2 crores was received during the year under review from the Commissioner of Payments in respect of claims relating to two nationalised units, *viz*, Burn & Co Ltd and Indian Standard Wagon Company Ltd. Thus, the principal amount outstanding as at the close of June 30, 1980 was about Rs 9.0 crores. Apart from this, an amount of Rs 1.1 crore was also outstanding by way of principal and interest in respect of three assisted units which have been nationalised.

Table 3: Recovery performance of IRCI

	Instalments of loans due for recovery* (Rs lakhs)	Amount actually realised (Rs lakhs)	(2) as per cent of (1)
	1	2	3
1977-78	624.19	75.30	12
1978-79	604.00	37.83	6
1979-80	1,335.00	72.00	5

* Includes arrears of loans brought forward from the previous years

The data relating to instalments of loans due for recovery including arrears from previous year brought forward, amounts actually realised and recovery percentage for the past three years are presented in Table 3.

The amount of loans realised during 1979-80 was higher at Rs 72.00 lakhs (Rs 37.83 lakhs in 1978-79). However, amounts realised as a percentage of loans due for recovery including arrears brought forward from the previous years declined from 12 per cent in 1977-78 to 6 per cent in 1978-79 and further to 5 per cent in 1979-80. At the same time, the amounts of arrears brought forward from previous years were on the increase from Rs 383 lakhs as at the end of 1977-78 to Rs 451 lakhs as at the end of 1978-79 and again to Rs 536 lakhs as at the end of 1979-80 thereby showing deterioration in recovery performance.

Financing fixed and working capital

By P. CHATTOPADHYAY

THE Reserve Bank of India has recently set up a committee for looking into the problems being faced by commercial banks and term lending institutions for reviving sick industries. This decision of the Reserve Bank has had the background of a deepening crisis caused by an upward trend in industrial sickness. The twelve-month period up to June 1980 witnessed quite a number of closed large and medium scale enterprises revived with bank and institutional assistance. The number, to be sure, has risen to 390 from 345 during the previous year. The number of sick enterprises so revived was of the order of 20,700. All this has meant that more than Rs 1,500 crores of bank credit has remained blocked in sick enterprises in the large and medium scale sectors and Rs 250 crores in the small scale sector. The cost of this assistance becomes many times more if one considers the uncertainty enveloping both return of loan and return on loan. Putting back these units on the rail is a totally different matter; for these units have continued to remain on the sick list for a long time before succumbing to the untold atmospheric hostility. This naturally calls for concern on the part of the Reserve Bank, involving as it does gargantuan financial stake from the point of view of banks and term lending institutions in the industrial sector.

It has also become quite fashionable among professional financial experts to claim proficiency in matters concerning industrial sickness, embracing both identification of such sickness and administration of cures as also predicting such sickness on the basis of some cognizable criteria, thrown up by their concerned intellectual disciplines. In the face of all these attempts to identify signs of sickness in the industrial sector, we have shown widely the knack of going round and round the main issues and highlighting wrong reasons. Needles in the haystack have been sought to be uncovered with lots of noise. That this wide prevalence of industrial ailments of different varieties is our own creation is not as widely recognised. Indeed, there appears to be different factors vying with each other to cause damage to healthy running of enterprises on recognised premises which we ourselves have prescribed in terms of different laws, regulations made thereunder and executive orders issued by government from different ministries, and departments. Healthy units have remained suspect for quite some time now.

Naturally, the government and the banking system have taken upon themselves the responsibility of deploying funds in causing cure to sick units involving in the process pouring money in fathomless pits. That we have jerked ourselves at the wrong end of the stick should not preclude in any way our attempts to be rational in dealing with enterprises, both corporate and non-corporate, both small and large scale enterprises and both public and private sector enterprises. Introspection being somewhat absent, committees after committees have attempted to decipher and disaggregate the viruses that cause the disease, often not quite appreciating that the signs and symptoms of such sickness would not require any searching analysis; they are as clear as day light. We owe an explanation.

It has been generally made out that industrial sickness has been primarily caused by 'stringent infrastructural con-

---

Dr Chattopadhyay is director of research, Institute of Cost and Works Accountants of India, Calcutta.

straints and disturbed industrial relations'. Though these are indeed important factors behind the malfunctioning of several enterprises belonging to different sectors of the economy, in a major way, sickness has remained ingrained in the policies formulated by the Government in the Ministry of Finance and the Reserve Bank of India. These policies relate to imposition of direct and indirect taxes, stringent bank credit, policies guiding the sanction and disbursement of funds for new industrial units and absence of co-ordination among different departments of government such as Railways, Ministries of Commerce, Finance and Industry.

It has been widely believed that while the institution of managing agency has been abolished, government has not yet been able to provide an acceptable substitute for some of the practices that the managing agency houses initiated, particularly with regard to inter-enterprise transfer of funds for tiding over short term difficulties. On the other hand, it has been widely noticed that government policy for both sanction and disbursement of funds for new industrial units relates essentially to long term capital requirements while working capital requirements are left to fend for themselves. In spite of all the discussions that have gone on for a considerable period of time regarding banks' shaking off the traditional approaches to collateral securities, the actual practice in the branches of different banks has remained wide of the mark. The same traditions continue unabated and professional assessment of feasibility reports has remained generally conspicuous by its absence.

Though inadequacy of infrastructural facilities and strained industrial relations have been common in many areas, affecting their growth and operational efficiency, they should not have been entirely unknown right at time the feasibility reports were being considered. It should be noted that, thanks to the drive and initiative of some financial institutions like the SICOM, entrepreneurs have found their adventures fruitful. In a majority of cases, however, problems have multiplied to come in the way of better performance. Some of these problems were easily noticeable but several were not.

Differential investment required for meeting the infrastructural needs of particular areas could be determined and specifically accommodated in the industry plans for these areas, either by way of subsidies or grants or loans or even a combination of all these three. Even then, critics underline that the differential benefits of government's incentives for promoting industries in backward areas, industries in rural areas and industries away from the main cities would not compare favourably with the extra investment necessary for establishing and running industrial units in these areas. During the last decade and a half government policies have sought to create an atmosphere for entrepreneurs to establish units in relatively untrodden areas. Cost benefit analysis of such a step, however, remains to be done.

Liquidity crisis has all along remained a much bigger factor than all the other factors put together in causing industrial sickness. Part of this crisis is created by the fact that under the accrual system of accounting, units are made liable to pay advance tax, declare dividend and pay such dividends to shareholders within a specific period of time in cash and present an unrealistic flourish in the accounts which are on better than partial truths. Thus, the paper profits shown in the accounts, a large part of which remain unrealised, create problems as regards payment of bonus, etc to labour, payment of direct and indirect taxes and so on. Some relaxation allowed by government, some concessions given by government to such units, some appreciatoin of the difficulties actually experienced by these enterprises and perhaps some long rope given to them could have saved government a large part of the expenditure that has ultimately gone to such units by way of sickness benefits. A timely stitch is the crux of the matter in this regard of which we do not seem much aware even at this time of day.

While the *Report on Currency and Finance*, 1979-80 ascribes inadequacy of infrastructure and strained industrial relations as the factors causing industrial sickness, some of the policies pursued by the Reserve Bank of India are no less responsible in making units walk on the tight rope all the time. One in this context appreciates government's renewed thrust on the relatively unbanked sectors to receive priority of allocation of bank funds. It is also equally necessary to see that the existing industrial structure does not suffer just because government is intent to jerk the other end of the stick. The Tandon Committee norms, the Chore Committee recommendations and the general approach towards financing running industrial enterprises have created a constructive atmosphere in which normal functioning of industrial and commercial enterprises has come under severe curbs. And it is sure that pursuing the present package of policies of credit curb to these units will witness a growing number of sick units clamouring for government assistance to be put back on the rail. Huge funds have already been canalised to the sick units to put them back on track. Their growing number year to year, however, suggests that such canalisation of funds has not had the same salutary effect as one would expect.

Money coming too late becomes worthless because the chances of economic deployment of such money get reduced as the units come under different ailments essentially caused by lack of funds. In the aforementioned situations, a reference to the present picture of industrial sickness and outstanding bank credit would be revealing. Table I presents the picture as it relates to end-June 1978 and end-June, 1979. As evident from figures presented in the table, in every industry category excepting cement, the number of sick industrial units has shown an increase as between the years 1978-79. In the case of cement industry, the number of units remained the same during the period. Thus, from 325 units involving an amount of outstanding bank credit of Rs 956.08 crores in 1978, the number of units rose to 345 involving an amount of outstanding bank credit of Rs 1,101.72 crores in 1979. In the cases of engineering units, the number rose from 112 to 115, in cotton textiles from 78 to 84, in sugar from 31 to 35, in jute textiles from 31 to 33 and rubber from 5 to 7 units.

The statewise and industrywise composition of bank credit to sick industrial undertakings enjoying aggregate credit limit of Rs 1 crore and above as at the end of June 1979 has borne witness to the wide prevalence of various ailments irrespective of industry groups or state boundaries, though West Bengal heads the list of sick units with 84, followed by Maharashtra with 71, Tamil Nadu and Uttar Pradesh with 36 and Gujarat with 35. Additional information available up to the end of March, 1980 brings to the fore that the combined investment of all the term lending institutions in industry was of the order of Rs 11,575 crores and that of the combined commercial banks came to Rs 8,963 crores of outstanding credit up to the end of June, 1979.

It has been alleged that the combined share of commercial banks and financial institutions has been as high as 75 per cent. The prevading industrial sick-

COVER STORY

ness and its year to year spread have not only slowed down the pace of new investment but also affected the profitability of the lending institutions themselves in several ways. Large stakes of financial institutions and commercail banks are thus to be viewed seriously and unless something is done about the phenomenon of sickness, there does not appear to be any easy going back on these issues. In several ways, the funds only trickle down to the recipient units and shorn of the working capital the entrepreneurs do not find their going easier either. Though costs are incurred on a wide scale in terms of funds lent and blocked, interest rates delayed and becoming doubtful and the extra effort required for halting these defaults cost effectiveness of the expenditure has never been looked into.

In this respect, the case of Japan comes to mind easily. In Japan, it may be mentioned, working capital requirements are accommodated in the funds lent by financial institutions and the entrepreneurs do not have to run about here, there and everywhere for making both ends meet. In the circimstances, a drastic change in lending policy is called for, particularly for accommodating the working capital needs of not only new entrepreneurs and enterprises but also sick units. The rebates and reliefs granted under the Income Tax Act have the precondition that to be entitled to such rebates and reliefs the enterprises must, first of all, earn a profit which they find it almost impossible in the face of multiplicity of constraints all around.

It is easy to understand and appreciate the anxiety of the government to hold inflation. It is not as easy to understand that what we call inflationary price rise is, in fact, a price push of commodities caused in a major way by the heavy incidence of indirect taxes. Whereas money is spread thinly by the government under various policies over a wide sector of economic activities, the so-called private sectors, the netting back is attempted only where money is immediately identifiable. One should not quarrel with the sectoral differentiation for the purpose of allocation of credit. One however, feels awed by the fact that government wants to get back this money through indirect taxation including those commodities which are consumed by rural folks on a wide scale, people of middle income groups and others in the urban areas.

The aggregate picture afforded by the industrial sector in this country is one of pervading sickness with raging uncertainty as to how long a unit will be in a state of health or in a neutral zone of neither health nor sickness till it rides on the sick bed. A total reconsideration of banking policy, particularly for financing both fixed and working capital, has become essential. If the right of healthy existence is denied to units, becoming over sympathetic when they have grown sick is a pointless exercise.

A reference here to the government policy for revival of sick units is relevant. It has been reported that a comprehensive policy for reviving sick units and preventing spread of industrial sickness is being evolved by the Union Government on the basis of a note prepared by the Central Ministry of Industry. Government has recognised that the equity base of small scale units is weak and requires to be strengthened by the creation of an equity fund for the small scale sector to be administered either by the Reserve Bank of India or by the Industrial Development Bank of India. The credit monitoring system by commercial banks is also sought to be strengthened and streamlined. On the other hand, the supply of raw material and other essential inputs to small units has been sought to be augmented and regularised. Albeit the late recognition of these biting problems, even now the other aspects of working capital requirements stand somewhat underplayed. The major bottleneck experienced by the small scale units is not merely supply of raw materials or equity funds as such. It is the totality of shortfalls that has counted significantly affecting the economics ofoperations of the small scale sector, contrarily, according to the report, government continues to be averse to extension of financial assistance, particularly short term working capital needs, to large scale private sector industries. This is as it should not be; for, it is the larger scale institutions in the industrial sector which, in fact, sustain the total industrial activity in the country.

A look at the Reserve Bank of India studies in company finances will have convinced the decision makers that capital composition in the corporate sector is heavily skewed, a few of the companies having a major share of the capital and a large number of companies have per unit capital grossly inadequate. If government does not do something diametrically opposite to the current policies, it will be a question of time as to when industrial and commercial enterprises ride on the sick bed one after the other. Such frivolous solutions as are offered under Section 72A of the Income Tax Act also require reconsideration, particularly in view of the fact that merger of sick units with healthier units *prima facie* requires calculative approaches to the possibilities of the sick units and if the patch of capital here, slight revamping touch there or both would put them back on the rail, it could be done even without the merger policy. To ensure perpetual existence of corporate enterprises, it is essential that not only a certain rate of profitability be allowed but also that the units should be allowed to plough back such profits more and more.

Table I : Sick industrial units and outstanding bank credit to them

(Rs crores)

Industry	End-June 1978				End-June 1979			
	No. of units	Percentage	Amount of outstanding Bank credit	Percentage	No. of units	Percentage	Amountof outstanding Bank credit	Percentage

Banks: Nursing a sick unit

By K. HANUMANTHAPPA & V. PRASANNA BHAT

SICKNESS in an industry requires nursing, if not hospitalisation, like human sickness. The most widely accepted definition of sickness is the one formulated by Reserve Bank of India, according to which a sick unit is that which has suffered cash losses continuously for a period of three years even before providing for depreciation and the current and debt equity ratios are adverse.

A sick person in a house gets special attention, nutritious supplements and is given rest. Similarly, a sick industry seeking revival under a nursing programme gets a concessional interest rate for its working capital finance, liberal terms with respect to margin stipulations of securities and also is exempted temporarily from the rigours of guidelines like Tandon Committee norms.

While it is very essential that genuine sickness in an industrial unit must be nursed back to its normalcy, care must be taken to see that only needy and really sick units are nursed. Especially so, since the concessions offered to a sick unit coming under a nursing scheme of a financial institution, are so tempting that even good industrial units with inept managements try to pass of themselves as sick units so as to avail of the substantial benefits. In normal walk of life also we come across with people who despite their perfectly normal health pose themselves as sick and get admitted into convenient hospitals to escape the onslaught of legal proceedings, disciplinary procedure in their work situation or simply for the sake of availing specialised attention thus preventing genuine and needy cases of ailing people from obtaining the essential medical care and attention.

Just as the medical science has diagnostic techniques for identifying the various ailments there are some well studied principles and criteria in signalling of sickness in industries. Qualitative description of the symptoms and statistical and quantitative formulae are available in this regard. While qualitative description of symptoms help the identification, the precise estimate of sickness and the nursability or otherwise of the sickness of a unit is possible only with the aid of statistical and quantitative techniques.

Before embarking on a nursing programme it is important to know whether a given unit is beyond redemption. Just as a doctor pleads his inability to accept a fatal case, financial institutions may not be in a position to come forward to under-take a nursing programme of a sick unit, unless the viability or otherwise of such a programme is ascertainable from proven statistical or quantitive techniques.

The causes for sickness of a unit and the appearance of such symptoms have been widely studied. The results of such studies have contributed amply towards the timely prevention of a unit becoming sick. The saying "Prevention is better than cure" is appropriate and relevant in the context of industrial sickness too. However, the theme of this paper is the development of the concept of 'Nursability' or otherwise of a given sick unit. Assuming that an industrial unit has become sick due to many or one of the several causes identified and has therefore, approached a financial institution with a proposal to undertake a nursing programme, the bank or the financial institution apart from scrutinising other things, must essentially apply such statistical techniques in order to know the feasibility or otherwise of the proposal in question.

The pioneering work in the development of such models was done in USA. In the UK a variation of the USA formula was accepted as suitable. The model derived in the USA is known as Altmann Criterion or 'Z' model, which has the following form

$$Z = 0.012X_1 + 0.014X_2 + 0.033X_3 + 0.06X_4 + 0.010X_5$$

where

$$X_1 = \frac{\text{Working capital}}{\text{total assets}}$$

$$X_2 = \frac{\text{retained earnings per balance sheet}}{\text{total assets}}$$

$$X_3 = \frac{\text{earnings before interest and taxes}}{\text{total assets}}$$

$$X_4 = \frac{\text{total market value of equity}}{\text{book value of total debt}}$$

$$X_5 = \frac{\text{sales}}{\text{total assets}}$$

By the application of this model for a series of units, it was statistically inferred that industries with a Z value of '3' cannot fail and, therefore, need not be considered as sick. Units with Z value in the region of '1.8' and '3' are considered as sick and can be nursed if a suitable nursing programme could be conceived and executed. Units with a Z score less than 1.8 are by and large sick industries which are beyond redemption as revealed by experience.

The model in vogue in the UK was developed by Messers Taffler and Tisshaw which goes with the name of Z model

$$Z = C_0 + 0.53R_1 + 0.13R_2 + 0.18R_3 + 0.16R_4$$

where 'C_0' is the adjustment constant and

$$R_1 = \frac{\text{Profit before tax}}{\text{Current liabilities}}$$

$$R_2 = \frac{\text{Current assets}}{\text{total liabilities}}$$

$$R_3 = \frac{\text{Current liabilities}}{\text{total assets}}$$

$$R_4 = \frac{\text{immediate assets} - \text{current liabilities}}{\text{operating costs excluding depreciation}}$$

'C_0' is a constant which is determined for a particular country based on business conditions and statutory provisions. In India this statistical technique was employed by Mr Bhaskar Banerjee and the problem of the constant 'C_0' was solved by adopting the differential technique by shifting the cut-off point to a positive Z score.

The objective of making mention of the above models is to emphasise that with the aid of such quantitative techniques it is possible to know whether the sick unit under question is a viable proposition for a nursing scheme. Moreover it helps to eliminate such units which are not sick, but which try to pass off themselves as sick ones with a motive of simply availing the wide range of concessions thrown open to sick units. It is human experience that a highly fondled child becomes a spoilt child. Similarly, 'nursing' healthy units which seek concessions under the guise of 'sickness' can cause not only damage to the industry but also prevents a needy and genuine unit from availing of such benefits.

Next consideration in the 'concept' of nursability is whether the needed technical and financial resources are available with the financial institution which proposes to undertake a nursing

---

Dr Hanumanthappa is Associate Professor of Commerce, Bangalore University and Mr Prasanna Bhat is manager, Karnataka Bank Limited.

programme. Just as a doctor verifies whether the needed medicine and medical equipment are available before admitting a patient, a financial institution must examine whether it can effectively provide consultancy in the field of production, marketing, personnel, management and finance, depending on the cause of sickness. In fact the financial institution must be even prepared to depute an expert or an external qualified consultant not only to supervise the operations of the industry but also to participate in the board of the company either as an observer or as a nominee director depending upon the gravity of the situation and the extent of sickness.

Mere administration of doses of financial help by financing institution does not solve the problem of industrial sickness. The concept of nursability envisages much more. It is the practical experience of one of the authors wherein he was actively involved in a nursing programme, the institution had to not only finance in appropriate doses during critical situations but also had to suggest the removal of certain insincere and inefficient employees from the rolls of the industry, apart from suggesting appropriate changes in production planning, material control, marketing preference and such other managerial skills. A series of concessions alone do not solve the problem of sickness, what is also needed is a close watching of the day to day working capital management and fixing up of priorities in the matter of payment.

Due to increased participation by various financing institutions like banks, IDBI, ICICI, LIC, UTI etc, in the operations of a company and also due to the availability of needed expertise in almost all such institutions, it is definitely possible to have a close watch on the financial position of a company and prevent the same from becoming sick. In the event of such a unit becoming sick, inspite of precautionary measures the concept of nursability can be effective employed and a scheme of nursing can be worked out if the unit is nursable as described in the above paragraphs. However, if the unit is not nursable either a merger or liquidation or such other steps are the other alternatives which may be appropriately selected.

SINGER SEWING MACHINE COMPANY

207, DR. D. N. ROAD, BOMBAY-400 001

NOTICE

It is hereby notified for the information of the public that Singer Sewing Machine Company propose to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of Section 23 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to its scheme of merger/amalgamation with the Indian Sewing Machine Company Limited. Brief particulars of the scheme are as under:

(i) Name and address of the applicant undertaking.	Singer Sewing Machine Company, Indian Branch. 207, Dr. D. N. Road, Bombay-400 001.	
(ii) Management structure of undertaking(s) proposed to be merged/amalgamated.	Singer Sewing Machine Company, Indian Branch General Manager	Indian Sewing Machine Company Ltd Managing Director
(iii) Capital structure of undertaking(s) proposed to be merged/amalgamated.	Rs. 170 lakhs represented by unremitted profits and merchandise invoices.	Athorised Rs. 3 crores. Issued and Paid up Rs. 70.
(iv) Present activities of the undertaking(s) proposed to be merged/amalgamated.	Marketing of Domestic and Industrial Sewing Machines, Knitting Machines, Needles, Oil Parts and Accessories.	Nil
(v) Reasons, in brief, for the proposed merger/amalgamation.	To comply with the Foreign Exchange Regulation Act, 1973 as required by the Reserve Bank of India, whereby subject to the necessary approvals, ISMACO will take over the Indian business of Singer Sewing Machine Co.	
(vi) Details of the exchange ratio/consideration proposed for shareholders/creditors, etc. of the amalgamated/merged undertaking.	As per the directive of the Reserve Bank of India, the consideration to be paid by ISMACO for the take over of the business of the Indian Branch of SSMCO is Rs. 170 lakhs.	

2. Any person interested in the matter may make a representation to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this Notice, intimating his views on the proposal and indicating the nature of his interest therein.

A. J. WOOD
General Manager
SINGER SEWING MACHINE COMPANY

Dated this day of August 19, 1981.

Inadeqate shipping services

By P. C. MAHANTI

EASTERN INDIA TODAY

CALCUTTA

EASTERN India's long-standing problem about inadequate shipping services compared to what the exporters need had a fair airing at the recent annual meeting of the Eastern India Shipper's Association here. Mr Sanjoy Sen, a particularly effective and articulate spokesman of the shippers' interests. explained the basic difficulties of the region, one of which was that Calcutta does not have the same shipping opportunities to far diverse destinations as Bombay has.

The reason is geographical in the first place. Calcutta does not figure in the cross roads of major international trade routes. The second major reason is the total dependence of the coast for ocean transport on the liner conferences. Indeed the eastern coast has the worst of both the worlds and does not get the benefit of competition in the liner trades as the countries in South-East Asia and East Asia do. For example, scrapping of the pooling arrangement among the members of the century-old India-Pakistan-Bangladesh conference has not produced much relief to the shippers in the region. However, the formation of the Indian container lines among the leading Indian shipping companies is a welcome development and should help Indian shippers if it continues to remain service-oriented as the professed aim.

Increasing containerisation of cargo is another hopeful development. The ports of Calcutta and Haldia which are trying to attract container traffic to increase the volume of cargo handled by them could do this more successfully if certain infrastructural handicaps are removed. Haldia especially suffers from a number of infrastructural constraints. It is now ready as a modern container handling terminal but due to the absence of basic facilities like road transport, telephone communications, arrangements for overnight stay etc the port is not attracting sufficient container traffic and the little traffic that it does handle creates enormous problems for both shipping lines and the shippers. There is not even a container freight station.

According to present plans arrangements will be made to move containers by barges from Calcutta to Haldia, in fac a container link terminal at a Garden Reach jetty for this purpose is being set up. Provided the cost is reasonable it should help Haldia to handle more container traffic in this way. The idea of moving containers by barges from north-east India to Haldia should also be pursued for Haldia serves the same hinterland as Calcutta and greater use of inland water transport should help the country's tea and other exports as the cost would be very much cheaper than transport by road or rail.

At Calcutta port, a shed has been allotted at the Netaji Subhash docks exclusively for the purpose of handling container traffic. Yet as Mr Sen points out there is no worthwhile plan till today to develop container handling facilities at Calcutta port step-by-step to a point where the major part of the general or break bulk cargo that passes through the port can be carried by container vessels. It is time also some thought was given to monitoring the traffic pattern at Calcutta port and prepare a master plan for its development. Considering the perpetual conditions of congestion at Bombay port and lately in Madras, Calcutta port could be modernised and developed to handle much more traffic than now.

From a peak of 11 million tonnes in the mid-sixties Calcutta handled only 3.5 million tonnes of cargo last year. Together with Haldia the entire port complex handled about eight million tonnes. This is less than 10 per cent of the national total of about 70 million tonnes for all the 10 major ports taken together. At one time Calcutta port handled 50 per cent of the country's exports and was thus the premier export port and 25 per cent of imports. The total volume then was smaller but there is no doubt that the port has declined in importance due to hydrological hazards of the river on which it is situated and ever increasing size of ocean carriers which can no longer call at this port due to draft limitations. Haldia was thought to be the remedy. It is some 65 km downstream and does not suffer from the shipping problems of Calcutta as the river from that point at Haldia up to the sea is rather deep and does not get silted at the stretch between Calcutta and Haldia does.

The Farakka barrage has brought some relief yet considerable dredging of the river is essential to maintain the shipping channel with a reasonable degree of draft to permit the vessels to enter and exit without any serious difficulty.

Joint ventures

The West Bengal Industrial Development Corporation has still ample faith in joint ventures, the failure of the Webel tyre project notwithstanding. The reason cited that a modern tyre plant in the country needs to utilise 85 per cent of capacity only to break even is not very convincing. In any case the private partner backed out at the last minute and the project could no longer be taken up as a joint venture on the proposed pattern. The question whether the WBIDC is looking closely into the capabilities and credentials of private partners before deciding on a project is often being asked. The same thing happened to Purulia cement project also. However, the WBIDC has shown greater tenacity in the latter case and has persuaded the Cement Corporation of India to set up the plant in Purulia district as a joint venture.

West Bengal Scooters, another joint venture, is limping along and incurring losses. The plan now is to diversify producton. Rolling of alloy and special steel is one of the lines being considered. The chairman, Mr Tejmoy Ghosh, does not want to give up in this case for he says closure will mean unemployment of a large number of people.

He also would like to publicise all success stories. The Darjeeling plant to assemble wrist watch components is a successful venture. It is a joint project with Hindustan Machine Tools. The annual capacity of 250,000 pieces a year has been reached and a profit is being earned. The project will be diversified in due course to make watch casings as well. A television joint venture is a success a well.

As for new joint ventures with promise of success mention may be made of the tungsten filament-making unit being put up in collaboration with the Andrew Yule at Kalyani and another to make mettalic anhydride at the same place and yet, one more, to make explosives in Birbhum district in collaboration with IDL Chemicals of Hyderabad.

BOOKS & IDEAS

An honest observer's viewpoint

India—The Turbulent Half Decade

by K. N. Subrahmanya

Southern Economist Private Ltd., 106-108 *Saleh Ahmed Building, Infantry Road, Bangalore* 560 001; 1981; *Pages vii*+200; *Price Rs* 65.

This is a collection of articles written by Mr K. N. Subrahmanya as editor of *Southern Economist* and published in the magazine between 1975 and 1980, except for some months during the Emergency, which lasted from June 1975 to March, 1977 and which put a severe restraint upon the freedom of expression in the country. This period in the country's history was dominated by politics in a way perhaps no other period was. No doubt the economic crisis—caused by the failure of the monsoon is more than one year in several states and the poor performance on the industrial front and elsewhere—was very much present. But the imposition of the emergency tended to draw attention to the political factors and the economic factors were pushed to the background in the minds of the people. The emergence of the Janata Party as the ruling party in the wake of the end of the emergency did not alter this preoccupation with politics. That explains in a large measure why most of the 35 articles of Mr Subrahmanya collected in this volume deal with politics.

Mr Subrahmanya's strong point is that he writes as an observer and not as a protagonist of this or that party or group which is the wont of several writers. Further he seeks to draw attention to the fundamentals of development. For example, he raises the question, "Why the literacy ratio in India is barely 30 per cent while many developing countries have succeeded in wiping out illiteracy altogether? ....why ..... has the size of the population below the poverty line actually grown over the decades....?"

The articles reflect the hopes and disappointments of the years. On May 1, 1977 Mr Subrahmanya, like many others, thought that "the victory of the Janata-CFD combine at the March 1977 Lok Sabha election is nothing short of a revolution through the ballot box" (p 31). A year later in August 1978 he was not so sure that the victory represented a revolution. "The party's record of 16 months is uninspiring. It cannot be said that the Janata Government has shown a sense of urgency in tackling the grave economic problems that bedevil the nation... The drift should stop..." (p 63). By October 1978 he came to realise what he earlier believed to be a ballot revolution to be a "false revolution" (p 67). Underlining his disappointment at the turn the events had taken, he wrote on October 15, 1978, "I say this with a tinge of sadness because, at the time the event occured, that is, when the ruling Congress party was voted out of power, at the Centre, I took a simplistic view of the transition by ballot. Without belittling the significance of the Indian voters' choice, I am inclined to say that it did not represent a conscious attempt on the part of the voters to dislodge the power elite from the position in which it was strongly entrenched." (p. 67)

This disenchantment was not a personal one but was general. Mr Subrahmanya, unlike many others, had the honesty to admit when and where he has gone wrong. However, the misunderstanding was not confined to the performance of the Janata Party alone. There was a failure to understand the strength of the Congress (I) led by the Mrs Indira Gandhi. In May 1979 the Congress (I) seemed to be an insignificant political factor (p 108). Within six months the author was writing on the possibility of Mrs Gandhi taking over power which she did in fact in January 1980.

It is interesting to speculate on what gives rise to such misunderstanding.

Subhash Chandra Sarker

Managing public sector

Principles and Practice of Public Enterprise Management

by Laxmi Narain

S. Chand and Co. Ltd., Ram Nagar, New Delhi-110 055; 1980; *Pages xi*+515; *Price Rs* 18.

The Indian public sector presents a variegated system, of which it is difficult to find a parallel in the non-communist countries of the world. The Indian public sector embraces a large number of organisations. This is also the case in some other countries. Where the Indian system differs is that it also embraces industrial organisations at different levels—Central and State. The importance of the public sector is given by the fact that it accounts for about a fifth of the net domestic product, nearly 40 per cent of the annual gross capital formation, a quarter of the net domestic savings, and about seven per cent of the employment in the country. How well the public sector is managed is thus of the utmost importance and a matter of concern for all citizens.

This book discusses management of public sector organisations at the Central level in India. The state-level public sector organisations are not covered by it. To the extent that the state-level organisations are modelled upon the Central-level organisations, this omission is not of any great significance. The volume confines its attention to the industrial undertakings. In 17 chapters the author discusses among other topics, the place and extent of the public sector in Indian economy, its rationale and objectives, nationalisation and compensation on nationalisation, the organisational pattern of public sector undertakings (public corporation, government company, departmental organisation and the like), the management pattern at the board level and at the unit level, measurement of efficiency, performance evaluation, pricing policies, industrial relations and public accountability. The discussion is factual and informative, in appropriate cases supported by necessary references. In the chapter on public relations and the consumer the author draws attention to the very poor institutional arrangement even in the public sector to protect the consumer.

The book eminently serves the interest of those for whom it is intended —*i.e.*, students, to facilitate whose use the book has been priced incredibly low at Rs 18 through a subsidy provided through the National Book Trust of India by the Government of India for the publication of the book.

MFA : Dilemma of EEC

International Trade in Textiles—the Policy of the European Community.

Michel Englert. Brussels, Bureau d'Informations Europeennes sprl (rue Hobbema 13); *February* 1981; *Pages* 194.

For all those who are interested in the Multi-Fibre Arrangement (MFA) negotiations a research organisation in

Brussels has published a detailed guide to the EEC's policies. Although it necessarily concentrates on the operation of the bilateral agreements concluded in 1977 in the framework of MFA-II, the 200-page work looks at the early preparations for the current MFA negotiations.

Its author, Michel Englert, neatly outlines the dilemma facing the EEC : it can reject demands from the developing exporting countries for increased access to the Community — but at the risk of a breakdown in the negotiations. Or it can accept these demands — and run the risk of a further decline in its textile industry.

Englert believes, however, that the two sides "will once more find a compromise." He feels the tendency on the part of European manufacturers to shift production to the developing countries may be drawing to an end : the development of artificial textiles and the growing recourse to increasingly advanced technology are changing the character of the textile industry, which is moving into the "heavy" industry category.

Englert points to two "particularly disquieting problems," to neither of which the EEC has a solution. The first is the slow restructuring of the European industry, the second the "astronomic growth" in imports from western industrialised countries, especially the United States.

He notes that at the same time Community policy is preventing low income countries from making full use of their export potential and points, as evidence of this, to fraudulent shipments, the increasing use by the EEC of the basket extractor mechanism and the difficulties it is experiencing in fixing quotas and meeting transfer requests.

The study includes a detailed account of (1) the Community's policy towards the Mediterranean and Lome countries; (2) the operation of the existing bilateral agreements; and (3) the GSP scheme for textiles. This shows that India was meant to be the principal GSP beneficiary, with potential duty free exports of nearly 25,000 tonnes, followed by Pakistan with just over 13,000 tonnes.

A useful feature of the study is an inventory of all the legal texts relating to the EEC's textile trade policy. The numerous tables include the 1981 breakdown, between the member states, of the quotas for each of the 8 "highly sensitive" products in Group I.

Malcolm Subhan

In Brief

Lectures on Company Law

by Shantilal Mohanlal Shah

in association with R. M. Kantawala, N. M. Tripathi Private Ltd, 164 *Samaldas Gandhi Marg, Bombay,* 400 002; 1981. *Pages xxxi,* 555, *cccxvi; Price Rs* 50

This is a revised version of the well-known book on company law, incorporating the Indian case laws till June 1980. Company law, as enacted in 1956, has undergone no fewer than eleven amendments—the last one to be effected in 1977. Another amendment by Parliament is expected. However, in our country it is not only the Acts of Parliament and legislatures that determine law, the verdicts of the courts of law also modify the laws to a substantial degree. This book, by incorporating the case laws, is intended to facilitate the understanding of the law. The text of the Act, as given at the end of the book, does not, however, contain the amendments of 1977 which are provided as Addenda at the beginning of the book. This is far from a convenient arrangement and the failure to print the text of the law properly in a book published in 1981 (four years after the amendment) is not easy to understand.

Need for coastal railway

IN an article in *Pigmy Economic Review*, published by Syndicate Bank, Dr N. K. Thingalaya, the editor of the journal, emphasises the importance of the construction of the Konkan railway on the west coast. He says the missing link is for a stretch of 867 miles from Apta near Bombay to Mangalore. The areas through which the Konkan railway is expected to traverse comprise only backward districts, except perhaps the Union Territory of Goa. The districts like Jaigadh, Ratnagiri. North Kanara and South Kanara are indeed backward districts.

Dr Thingalaya says further: "To make the dream of Konkan railway a reality, perhaps a different approach is necessary. The study of the west coast transport network sponsored by the Government of Maharashtra at the instance of the National Transport Committee and carried out by the Department of Economics, Bombay University last year has thrown a fund of data on the feasibility of railway system in this part of the country. It has been correctly pleaded in this report that instead of merely confining the analysis of cost-benefit in terms of financial returns, it would be worthwhile to examine the social benefit cost of this project. From the financial analyst's point of view, this project may require a huge investment and may not yield the necessary returns over a fairly long period of time. However, if we consider the social benefit which this project may confer upon the economy of this region, it can be perhaps said that this project would be of immense economic utility.

"A few attempts have been made in developing some pockets as industrial centres in four districts. Some activities for industrialisation have been initiated and a few large scale industries have already been established in these four districts—the chemical plants in Jaigadh district, aluminium industry in Ratnagiri district, caustic soda and paper mill in North Kanara district and the huge fertiliser complex in the joint sector in South Kanara. However for a speedier development of industrial activities in this part an efficient railway system would be most essential. Considering the potentialities of the region and its hinterland, there is an imperative need for providing a boost to the economic activities. In the case of this project, it is highly desirable that the Indian Railways must make a departure in their approach to investment on the new railway line. Since the railways under the budgetary provisions cannot afford to go in for new railway line, it is suggested that a new corporation "Konkan Railway Corporation" can be established by the Indian Railways. This corporation can be established as a public sector undertaking which can be provided with the technical personnel by the Indian Railways. This corporation can raise capital for investment as a commercial proposition from the open market. The public sector banks which have a stake in the development of the region which will be the immediate beneficiary can also be asked to provide the working capital needed for the railways. The lead banks which are functioning in this area are Bank of India, State Bank of India and Syndicate Bank. The corporation can also raise funds through debentures."

25 years of Indo-German Chamber of Commerce

—A FEATURE

Greetings from Mr Karl Carstens

President of the Federal Republic of Germany

On the occasion of the 25th anniversary of the Indo-German Chamber of Commerce I should like to convey my most cordial congratulations.

During my official visit to India in the month of March this year my stay in Bombay has been one of the highlights. On this occasion I got to know the activities of the Indo-German Chamber of Commerce and I won the impression that this institution provides an essential contribution to Indo-German relations.

I am convinced that the Indo-German Chamber of Commerce with its record of successful activities for a quarter of a century will continue to foster and strengthen the economic cooperation between our two countries to the mutual benefit of our people.

Karl Carstens
President of the
Federal Republic of Germany

Message of greetings from
Mr Otto Wolff von Amerongen
President of the Association of German Chambers of Commerce and Industry

It gives me great pleasure to felicitate the Indo-German Chamber of Commerce on the occasion of its 25th Anniversary celebration on behalf of the German Chambers of Commerce & Industry, our German Chambers abroad and on my own personal behalf. I am happy that this Chamber has grown into a wide network—with its headquarters in Bombay and branches in Calcutta, Delhi, Madras and Bangalore.

I know of the significance and tradition of the Indo-German trade relations. I have come to know about it through the many discussions with members of the Indian government and through my visits to India. In the first 25 years since its inception, the Indo-German Chamber of Commerce has achieved commendable work in the area of Indo-German economic relations to the most extensive degree. Over and above the normal routine work of Chambers of Commerce abroad in an advisory capacity or as information centres it is effectively engaged in such activities as promoting licence agreements, preparing of market reports, market research and trade-fair promotion. Through its special programme of promoting medium-scale industry, the Indo-German Chamber of Commerce enable medium-sized German undertakings to find Indian collaborators. The Chamber has offered invaluable help in numerous cases, assisting in drafting collaboration agreements and successfully conducting the often difficult negotiations with government offices.

The work and significance of the Indo-German Chamber of Commerce was highlighted recently during the visit to India by the President of the Federal Republic of Germany, Mr. Karl Carstens, who gave the only public speech before the forum of the Chamber and on this occasion stressed the special importance of India in the area of German-Asian trade relations.

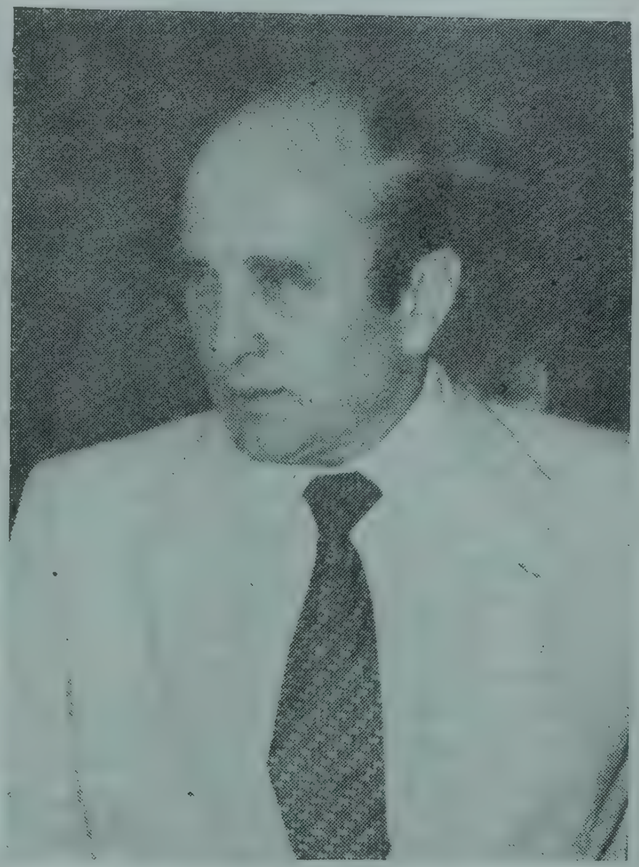
It is unfortunate that the economic development the world over prognoses a series of problems for the future, consequently casting uncertainty over the good relations between individual countries and markets. The work of the German Chambers abroad takes on added importance specially in difficult times. Despite the difficult situation of the world economic development, it is heartening to note the as yet unexplored possibilities in the spectrum of Indo-German economic relations. I am thinking particularly about the ever improving collaboration in the area of training and development. These are obvious spheres for contribution by the German Chambers of Industry and Commerce. In this connection, I would like to welcome the measures introduced by the Indian government in recent times towards the removal of administrative difficulties, resulting in marked improvements.

The future work of the Indo-German Chamber of Commerce is woven into the fabric of possibilities as it exists now. May the Chamber be successful in the coming years through its myriad activities in all the branches of economy, commerce and technology in contributing to the strengthened co-operation between the tradition and culture-rich sub-continent of India and the Federal Republic of Germany, thereby consolidating and continuing a trend already established.

O. Wolff von Amerongen
President
Association of German
Chambers of Commerce & Industry

Dr Otto Graf Lambsdorff

Minister for Economic Affairs
Federal Republic of Germany
who will be the Chief Guest
at the Silver jubilee celebrations
of Indo-German Chamber
of Commerce in Bombay
on August 23, 1981.



Forthcoming German trade fairs for Indian exporters

GERMANY is one of the world's leading organisers of trade fairs. Participation in these fairs, or even a visit to the same, offers the best opportunity of making new contacts and keeping oneself informed of the latest developments on the market for various products. The Indo-German Chamber of Commerce in India represents various German trade fairs in Berlin, Cologne, Duesseldorf, Hannover and Munich. Of these, the following trade fairs, to be held in Germany during October, November and December 1981, are specially suited to Indian manufacturers and exporters.

ANUGA, World Food Market, Cologne (10 to 15 October 1981) : At this food fair, the variety of items displayed include beverages, milk and dairy products, sweets, frozen foods, non-foods and all general foodstuffs and provisions. At the last ANUGA, which was held in September 1979, 4,140 exhibitors from 79 countries took part. There were 15 exhibitors from India, displaying items like frozen and canned fish specialities, pickles, canned mango products, spices, cashew nuts, coffee and tea.

A + A, Industrial Safety and Occupational Health — Congress and International Trade Fair, Duesseldorf (6 to 9 October 1981) : This exhibition will present production techniques with special emphasis on safety, methods of humanising working environments, accident prevention techniques, protective clothing and equipment, new trends in occupational medicine, hygiene and industrial psychology. At the last meet in November 1979, A + A had a participation of 275 exhibitors and 25,650 visitors from 15 countries and 25 countries respectively.

IGEDO, International Fashion Trade Fair, Duesseldorf (25 to 28 October 1980) : This fair, a window on world fashions for ladies' and children's wear, is held four times a year — in March, April, September and in October. Six Indian firms participated at the meet in October last year, displaying dresses, skirts, trousers, shirt and trouser combinations, blouses, jackets, shirts, ladies' and children's suits, quilted jackets, vests, scarves of cotton, viscose and crepe, sandals and leather articles. In all, over 1,800 firms participated in IGEDO during this meet.

MEDICA, International Congress and Trade Fair — Diagnostica — Therapeutica — Technica, Duesseldorf (18 to 21 November 1981) : Electromedical equipment, laboratory equipment and materials are among the main items exhibited at this fair. Five hundred and thirty-three exhibitors from 14 countries participated at the last MEDICA held in November 1980.

SYSTEMS, Computer Systems and their application — International Congress and Trade Fair, Munich (19 to 23 October 1981) : This fair is specially suited to Indian exporters of software. The software products exhibited include basic software, system-oriented software, multi-purpose software and the various applications of software in general. At the last meet in September 1979, there were 454 exhibitors at this fair.

Productronica 81, 4th International Trade Fair for Manufacture in Electronics with Conferences, Munich (10 to 14 November 1981) : The main groups of exhibits cover production of electronic components and assemblies, equipment production and general manufacturing techniques, instruments for measuring, testing and inspection. The Productronica held in November 1979 had 783 exhibitors from 19 countries and 31,200 trade visitors from 51 nations.

Tickets and detailed information regarding all these fairs can be obtained from all the offices of the Indo-German Chamber of Commerce.

Growing Indo-German economic ties

By RADHESYAM PUROHIT

TRADE is better than aid — this slogan raised by the Indian policy-makers only a couple of years ago has already paid attractive dividends, Indo-German economic relations, marked by a stagnation till 1975, picked up quickly the opportunities open to it and entered into a new phase of expansion and growth. Both ways exchange of goods and services showed an all-time record of DM 2.5 billion last year (according to the latest exchange rate 1 DM = Rs 3.59) which corresponds to an increase of 87 per cent over Indo-German trade concluded in 1975. This achievement is partly due to the active support and help of the Indo-German Chamber of Commerce in Bombay, which is now celebrating its 25th anniversary.

The Federal Republic of Germany became an independent and sovereign state on May 5, 1955. India was one of the first countries to recognise the new German republic. Eight months later, on January 20, 1956, the Indo-German Chamber of Commerce was founded in Bombay. For the Federal Republic of Germany, the chamber was first of its kind in Asia. One year after the establishment of the Indo-German Chamber of Commerce in Bombay, it registered 268 members. Today the chamber with its five branches has on its roll more than 2,000 members in India.

In the initial phase of the West German Republic, the then Chancellor, Dr Konrad Adenauer, was greatly in need of dependable political friends in the world. Jawaharlal Nehru, India's first Prime Minister, was also in search of dependable economic friends, who could help establish basic and heavy industries in new India. As Mr Nehru commanded a leading voice on the international political platform, Dr Adenauer placed much hope in Mr Nehru's sympathy for the "German problem". Nehru, however, was clear in his mind that the "German problem" was not to be solved by unilateral and arbitrary politics of Dr Adenauer, which ignored the post-war reality and the existence of the second German state, the GDR. But he also did not recognise the GDR in order to avoid jeopardising Dr Adenauer's political concept of the "solution" of the German problem. It took fourteen years for the Federal Republic of Germany to realise what Mr Nehru insisted and for what he was criticised by Dr Adeneuer, that the real solution to peace in Europe was to accept the post-war reality. With Willy Brandt becoming Chancellor in 1969, Bonn initiated the so-called "Ostpolitik", which brought a new era of political peace in Europe.

On the economic and industrial front West Germany started the world with its "Economic Miracle" in the late fifties. Indo-German economic co-operation simultaneously also recorded a high degree of priority in both countries. As in those days India needed heavy investment goods and her capacity to export was limited, the bilateral trade was naturally unfavourable to India's balance of payments. The deficit remained to the amount of DM 900 to DM 750 million annually till mid-sixties. Of course, India was striving hard to export more and thereby narrow the gap of the deficit in trade. But the West German market was not only sophisticated but also extremely competitive. India also felt this competition even in its traditional exports to West Germany from a number of other developing countries.

Meanwhile the open exchange of ideas and views between Indians and Germans forced the exporters to improve their goods through the use of better technology to meet the required standard in the German market. Here the Indo-German Chamber of Commerce have rendered creditable services to India. During the last ten years, various efforts were made to supply authoritative information regarding the West German market to Indian businessmen. Also, it was underlined that a country like India should not depend for her industrial development on official capital aid from abroad. The country must stand on its own feet to export more and redress the adverse balance of trade. India's neighbouring countries — Hongkong, Singapore and South Korea—showed that even tiny states performed much better than the giant India.

That has obviously spurred India to greater export efforts than in the previous years. India has now earned the reputation of being among the first 10 industrial nations in the world. In West Germany, the traditional image of India -- a country full of snakes, fakirs, poor and hungry people and above all maharajas — is slowly fading away. The economic and industrial potential of India is being rediscovered by the German business world. Already the private German investment, which was stagnant for years has recorded an increase of 7.4 per cent in 1980 to DM 191.9 million. Also India has private investments in West Germany to the tune of about DM 5 million.

One of the important factors, which has contributed to the larger demand for Indian goods, is India's continuous participation in West German trade fairs. Now it is an essential part of India's export policy to participate in all important trade fairs abroad. In West Germany, India is taking part in 15 major trade fairs round the year, covering major industrial and consumer goods. Such participation not only convinces the buyer on the spot about the quality and standard of the goods, but also contributes to the image of the seller. Here again the Indo-German Chamber of Commerce have helped in organising Indian participation in the German trade fairs.

Among the "traditional" export items, cotton garments, carpets, leather goods, tea, precious stones, oil cakes, garments of silk and rayon and synthetic fabrics have expanded their earnings substantially this year. Items like leather, cotton fabrics, jute and copper alloys and goods failed to keep their record of last year.

Though the overall achievements of Indo-German trade seem to be encouraging, much is still to be done. Keeping in mind the fact that even Indian exports worth DM 1,384 million to West Germany in 1980 do not even make halt per cent of the total West German imports the vastness of the existing possibilities for expanding Indian exports would be clear. For Indian exports West Germany ranks fifth after the USA, Japan, the Soviet Union and Great Britain. In West German imports from East Asian countries, India ranks 8th and third as importer of German goods.

Mr Purohit is Bonn Correspondent of Commerce.

25 years of Indo-German Chamber of Commerce

THE history of Indo-German relations is marked more by cultural than by economic links. Students of history are aware how Goethe praised the Sanskrit play *Shakuntala*, how Schopenhauer admired the *Upanishads*, how Max Mueller was called Moksha Moola and Paul Deussen called Devasena by their Indian admirers in loving appreciation of the pioneering studies made by these German Indologists.

While such 'manna' of mutual admiration may be nourishing enough in the spheres of literature and culture, it is unfortunately not solid enough to form the basis for profitable trade and commerce between our two countries. The base for a sound economic relation between India and Germany was laid much later, and got real momentum only after independence of India. However, the first economic links date back as far as to the 16th century.

Between the 16th and the 18th centuries, a number of German companies were established with the express purpose of trading with India and other East Asian countries, and every one of them was short-lived and had to be wound up. It was only in the 19th century that the German initiative in reviving the trade with India proved moderately fruitful. The first German trade representation was set up in Bombay and Calcutta in 1844, with the opening of consular offices by the Hanseatic and Free City of Hamburg. The consulates of Prussia followed in 1854 in both the cities, and the consulate of Hannover in Calcutta in 1855. The trade volume increased gradually, and a regular shipping line was started a few years later between Hamburg and India. In 1867 the German firm Siemens laid the telegraph line between Calcutta and London. The first Indian branch of a German bank came to Calcutta in 1896. At the turn of the century, the German imports from India were about 215 million marks, while the exports to India were about 60 million marks.

Trade statistics in terms of rupees or marks over several decades are rendered invalid by the changes in currency values, but it may come as a surprise to many that the balance of trade was almost always in favour of India until India gained Independence and launched its ambitious plans for economic development. The imports of iron and steel, machinery, electrical equipment, chemicals, etc necessitated by the development plans led to a continuing trade deficit in Indo-German trade, which persists even today, however, to a lesser extent than a couple of years ago.

As already mentioned economic relations between India and Germany gained momentum only after independence of India. Today, we look back on three decades of progress in imports, exports and industrial collaboration supported by the activities of the Indo-German Chamber of Commerce during the last 25 years.

Indo-German trade 1956-1981

A survey of the development of Indo-German trade since 1956 shows a highly irregular graph. In the course of the last 25 years, there have been times, when the growth rate of India's exports to Germany plunged to minus 23 per cent (1967), others, when it rose to an unprecedented level of plus 55 per cent

Table I: Indo-German trade: 1956-1980

Year	Exports to Germany (DM million)	Growth rate (%)	Imports from Germany (DM million)	Growth rate (%)	Trade gap (DM million)
1956	189.2	n.a.	819.0	+38.9	629.8

* As per Indian statistics; the figures for the following year as per German statistics.

(1976). Again, between 1956 and 1966, German exports to India reached a peak in 1965 with a growth rate of 35 per cent and a total value of DM 1.1 billion. Another sudden spurt was recorded in 1974 and again in 1977, when growth rates of plus 29.8 per cent and plus 23.7 per cent were achieved. In spite of these erratic movements to be noticed during some years, the overall development during the last 25 years is marked by a steady growth both in imports as well as exports.

As compared to 1956, Indian exports to Germany were about five times as much in 1980, while German exports to India were higher by 67.6 per cent. In 1978, for the first time, the total value of Indo-German trade exceeded the two billion mark and reached DM 2.5 billion as per the end of 1980. Indo-German trade continues to rise also in 1981.

Along with the development in the volume of Indo-German trade, there has also been a gradual metamorphosis in its composition *i.e.* one can perceive India's gradual development as an exporter of finished goods to Germany. Whereas in 1956, raw materials (excluding foodstuffs and fuels) accounted for 46.6 per cent of India's total exports to Germany, in 1980, their share fell to 5.2 per cent. In fact, the share of finished goods, whose volume accounted for barely DM 0.9 million in 1956 in a total of DM 189.2 million, rose to 43 per cent or DM 489.4 million in 1980. German exports to India, on the other hand, still consist mainly of capital goods like machinery, vehicles, electrical goods, chemical and pharmaceutical products as before.

Germany continues to be one of India's leading suppliers, ranking fifth in 1979-80 (1.4-31.3).

Also among India's major buyers, Germany held the fifth position in 1979-80. Among Germany's main trading partners, India ranked third among Germany's East Asian buyers in 1980 and eighth among the suppliers of this region.

Indo-German industrial collaboration

The modern history of Indo-German collaboration dates back to the early fifties with such outstanding collaborations like the Daimler-Benz joint venture with TELCO and the Bosch factory in Bangalore under the name 'MICO'. It is a remarkable fact that right from the beginning, not only big German companies came to India, but also medium-sized and smaller German undertakings — a tendency which continues till today. In fact, the first Indo-German joint venture after Independence was the trading house of Protos Engineering which was initiated by Mr Heller, who later on became the founder-president of the Indo-German Chamber of Commerce.

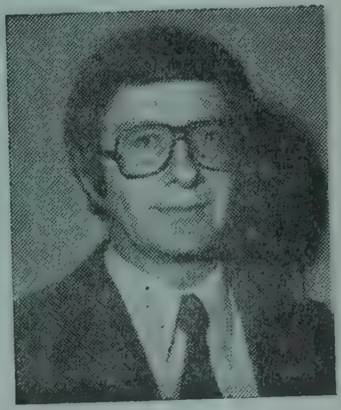
The formation of new Indo-German joint ventures gained momentum during

WHO'S WHO IN INDO-GERMAN CHAMBER OF COMMERCE

Dr H. LANGER
President

Mr AKBAR HYDARI
Vice-President

Dr G. KRUEGER
Executive Director



the mid-fifties when also the Indo-German Chamber of Commerce was formed. We observe a stagnation during the early seventies and of late, once again, a revival of German investment in India.

Since 1956, German private investment in India showed a marked positive trend until 1971. Thereafter, it stagnated and even declined, varying between DM 170.8 million and DM 180.3 million, until in 1980, a firm positive trend was secured with a rise of 7.4 per cent. With that, India ranked sixth with respect to German investment in Asia, preceded by countries like Israel, Iran, Japan, Singapore and Hongkong.

In India, figures on foreign collaboration normally relate to the number of collaborations sanctioned by the Indian Government, irrespective of whether they are joint ventures or technical collaborations. Germany belongs to the group of the 'big three' — the others being the UK and the USA — who have been India's main suppliers of technology. As per latest statistics of the Indo-German Chamber of Commerce, there are 511 Indo-German collaborations existing, out of which 121 are joint ventures (see table 4).

At the end of 1980, Indian investment in Germany amounted to DM 22.7 million, invested primarily in the fields of banking, consultancy and engineering. Though as compared to the previous year, this was lower by 3 per cent, Indi continued to maintain its position as th sixth largest Asian country investing i Germany. As in the previous year, it wa preceded by countries like Japan, Iran Kuwait, Hongkong and South Korea.

Table 5: Number of Indo-foreign collaborations sanctioned by the Indian Government (with respect to 12 main countries)

Country	Up to 1960	Up to 1970	Up to 1980
UK	223	849	1,455
USA	81	579	1,212
Germany*	79 (30)	499 (156)	1,108 (230)

Czechoslovakia	6	38	71
Denmark	8	36	64

* Figures in brackets indicate the number of joint ventures i.e. those with financial participation

SIEMENS

Relevant Technology

Developing countries need technology that provides specific solutions. Siemens India, drawing on Siemens research and development worldwide, adapts technology to the precise requirements of industry, and other areas of national priority—mass transport, communications and medicine.

Testing of SIMATIC potted block modules

In resonance with today's needs Siemens is providing appropriate non-computerised automation systems for India's modern steel, cement, power plants. Our range of motors, switchgear, switchboards, medical equipment, electrical railway signalling systems are other examples of adapting technology to suit local conditions.

Siemens India today: 6 works, and nearly 7000 employees. Engaged in power, communications, medical engineering for India's drive for self-sufficiency.

511 Indo-German collaboration agreements

ACCORDING to the latest statistics of the Indo-German Chamber of Commerce, there are at present 511 Indo-German collaboration agreements in operation thereof, 121 with financial participation.

Of the total number of collaboration agreements, 56 per cent are involved in the machinery sector and 10.5 per cent in chemicals and pharmaceuticals. In the latter case, 40 per cent are joint ventures; with respect to machinery, this percentage is lower at 33 per cent. Again, the percentage of firms with German share capital exceeding 40 per cent (the maximum limit prescribed by FERA) is higher in the case of chemicals and pharmaceuticals : 44 per cent as against 32 per cent in the machinery sector. In all, 17 per cent of all Indo-German joint ventures have German financial participation of more than 40 per cent.

A regionwise analysis shows a concentration in the Bombay-Poona region, where 36 per cent of all Indo-German collaborations are located. Calcutta comes next with 14 per cent, followed by New Delhi with 11.7 per cent and Bangalore and Madras with 6.7 per cent each.

With respect to joint ventures, from the 121 in operation, 41 per cent are located in the Bombay-Poona region; 13 per cent in New Delhi, 10.7 per cent in Calcutta, 7.4 per cent in Bangalore and 6.6 per cent in Madras. Altogether, these regions account for 80 per cent of all Indo-German joint ventures. In the Bombay-Poona region, there are nine joint ventures with German share capital exceeding 40 per cent, in Calcutta 5, in New Delhi and in Bangalore 3 each and in Madras 1.

A branchwise split-up reveals that in the Bombay-Poona region, the majority of collaborations are concentrated in the chemicals and pharmaceuticals sector, in New Delhi in the vehicles and ancillaries sector, general machinery in Calcutta, and electrical machinery and machine tools in Bangalore. In the case of Madras, however, no such concentration is obvious.

Over 58 per cent of all existing Indo-German joint ventures started production during the sixties (1960-1969) thereof, 11 in 1963 alone. Of the balance, 15 per cent came into existence during the 1950s, 19.8 per cent during the seventies and the rest during 1980 and 1981. The branchwise distribution of new collaborations during the 30-year period (1950-1980) is given below :

	1950-59	1960-69	1970-79	1980
	(% share in the total number of new joint ventures)			
Chemicals and pharmaceuticals	25	14.5	9.5	—
Vehicles and ancillaries	25	8	9.5	25
Machinery	18	55	52.4	75

In 1981, three new joint ventures have started production thereof, two i the machinery sector and one for instruments and hand tools.

A directory of Indo-German collaborations, giving detailed and up-to-dat information on all Indo-German collab ration agreements can be obtained from all offices of the Indo-German Chambe of Commerce by September 1981

Activities of the Indo-German Chamber of Commerce

WITH a record of outstanding performance behind it, the Indo-German Chamber of Commerce, in its Silver Jubilee Year, continues to pursue the objectives set out at the start : promoting Indo-German economic co-operation.

Concentrating on two lines of activity — Indo-German industrial collaboration and Indo-German trade — the Chamber offers the following services :

The Chamber acts as a media for the setting up of Indo-German industrial collaborations by facilitating the establishment of contacts and giving advice and assistance in the drafting of collaboration agreements and in negotiations with the Government.

Through its various journals, market reports and, above all, through its bulletin *Indo-German Economy/Deutsch-Indische Wirtschaft* which has a circulation of more than 4,000, the Chamber makes available latest news and useful information regarding economic situations in the two countries, their mutual trade relations, customs duties and the Generalised System of Preferences, trade enquiries, the market for specific products in Germany and how best one can set up business in Germany.

The Chamber represents Germany's leading trade fairs : Berlin, Cologne, Duesseldorf, Hannover and Munich. Bookings, fair passes, trade fair catalogues, arrangements for stands and personnel — all this is undertaken by the Chamber.

The Chamber offers its own arbitration. The Chamber's arbitration clause which is included in a number of collaboration agreements and trading contracts, reads :

> “Any dispute or difference or claim arising out of or in relation to this contract, including the construction, validity, performance or breach thereof, shall be referred to the Indo-German Chamber of Commerce, Bombay, for settlement under the Arbitration Rules then in force. The Award of the Arbitration Court of the Chamber shall be final and binding on the parties hereto.”

Legal assistance is thus offered by the Chamber for the amicable settlement of trade disputes, claim cases and disputes arising out of collaboration agreements.

The Chamber issues letters of recommendation necessary for obtaining a visa for Germany and certificates of origin.

Lastly, the Chamber maintains a library, provides translating facilities and now and again organises seminars and discussions on issues like industrial and technical collaborations, marketing and export promotion.

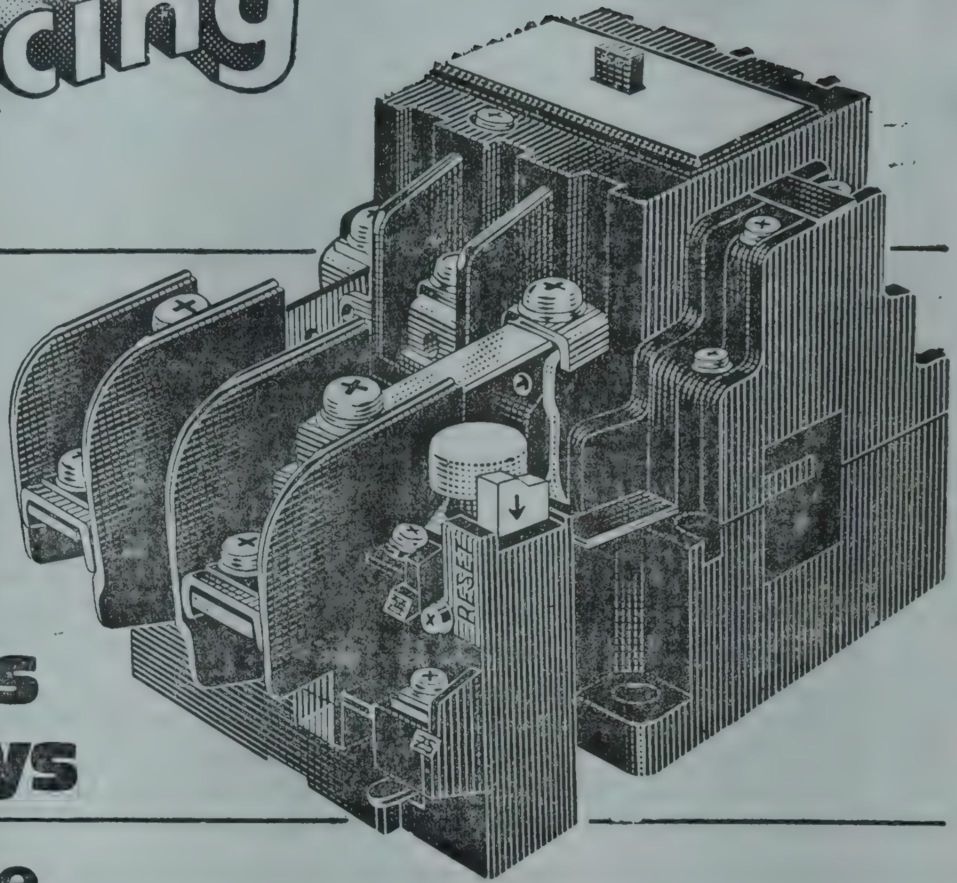
Introducing

YULE

heavy-duty contactors and relays



The widest range. The finest performance. The best value for money.

Andrew Yule, in technical collaboration with Togami Electric of Japan, is now progressively manufacturing the widest range of heavy-duty contactors and relays. Built to meet the most arduous conditions, Yule contactors and relays are of the highest standards and highly dependable in use. The various accessories available go towards making this range one of the most compact, convenient and versatile in the country.

The simple design facilitates easy mounting and ready access to main and auxiliary contacts, resulting in installation economy.

- Available in ratings of 6, 8, 18, 20, 50, 100, 150, 225, 300, 450 and 600 AMPS with three main contacts plus 2 NO and 2 NC auxiliary contacts.
- All contactors conform to the requirements of IS 2959 and IEC 158-1.
- Contactors are light and compact. Dust-proof construction of auxiliary contacts prevents entry of foreign bodies.
- Low cost protection for all applications.
- Main contacts are of silver cadmium oxide. Auxiliary contacts are of silver alloy ensuring long life.
- Self lifting clamps and large pan headed screws simplify cabling.
- Low operating noise.
- Overload relays available in autoreset or handreset with ambient temperature compensating device.
- Relays are available for contactor mounting or individual mounting.

Take your choice from the Yule range. Drop us a line for more information.

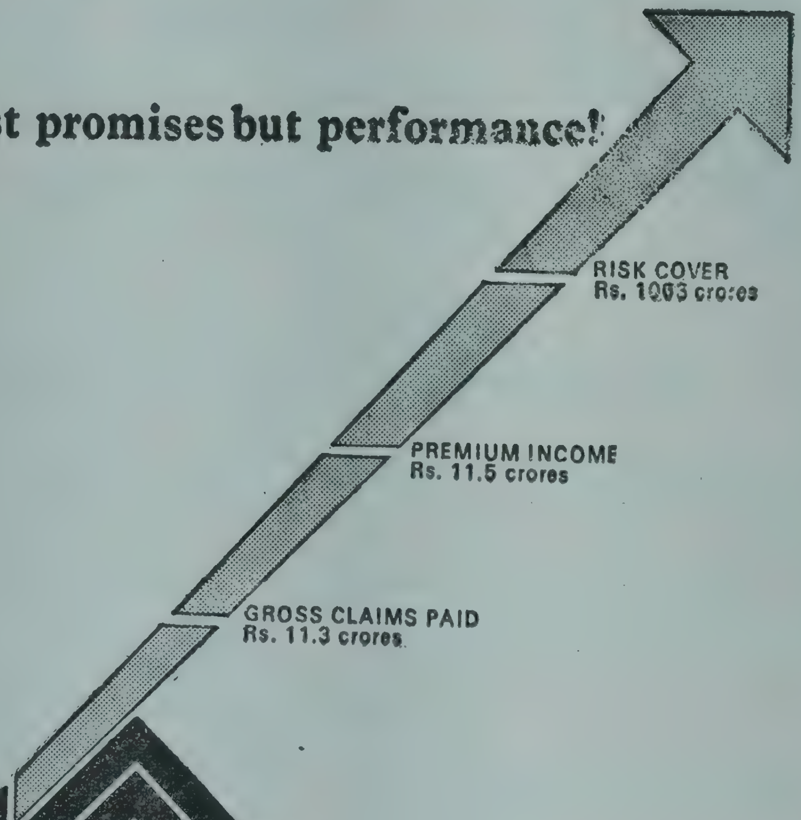
ECGC sets a few more all time records!

Not just promises but performance!



We promised ourselves that we'd go the extra mile for our exporters. And, go the extra mile we did!

Risks covered by the Corporation crossed the 1000 crore rupee mark for the first time in 1980!

Premium income touched a new high at Rs. 11.5 crores.

Gross claims paid in 1980 were a record Rs. 11.3 crores. That means nearly 25% of the total claims paid by ECGC in 24 years of its existence were paid in 1980 alone!

Project and Term Exports covered by ECGC in 1980 touched an all time high of Rs. 1261 crores.

At ECGC, 1980 has gone down as a year of outstanding performance and 1981 portends increasing promise. The time to think export is NOW!

INDIA AND IMF

Will loan terms be stiff?

From OUR SPECIAL CORRESPONDENT

NEW DELHI

THE Union Finance Minister, Mr R. Venkataraman, has once again assured the country that, in borrowing Rs 5,000 crores from the International Monetary Fund (IMF) (SDR 5 billion or about $ 5.65 billion), India will not accept from the IMF any term "derogatory" to the honour or interests of the country. As if to further reinforce the statement Mr Venkataraman at a tele-press conference in New Delhi on August 13 said that except for India and the IMF nobody knew the terms which were being discussed. In any case the agreement would be a "public document" once the negotiations were over and an agreement reached.

The past is not forgotten easily and at the tele-conference Mr Venkataraman was asked a pointed question whether the IMF had proposed devaluation of the rupee as a dondition to the loan. It was the IMF that almost forced India to devalue the rupee in 1966, soon after Mrs Indira Gandhi had assumed office as the Prime Minister for the first time, and obviously in referring to "derogatory terms" Mr Venkataraman had this in mind.

The news that India was negotiating a loan with the IMF had been in the air for some time. The first figure mentioned was Rs 4,000 crores until Mr Venkataraman himself, in an interview to All India Radio on August 11, disclosed that the loan sought was for Rs 5,000 crores. Earlier on official team led by Mr R. N. Malhotra, Finance Secretary, had held talks in London and Washington with the IMF. The Finance Minister in the marxist West Bengal Government Dr Ashok Mitra, was the first to react violently to the news and expressed the fears that the IMF would impose very stiff terms for the loan and the suggestion was that devaluation may be one of them. A group of economists, some of them left of the centre, rallied round this point of veiw at a two-day meeting in Calcutta and said that the IMF advanced loans in foreign exchange only at a high price. It had been found earlier, they said, that borrowing countries had to lose much of their economic freedom and were forced to re-shape their economic policies in accordance with the conditions laid down by the IMF. What news correspondents at the tele-press conference in New Delhi had at the back of their mind was this view of the group of 23 economists, a view which Mr Venkataraman sought to dispel. He had earlier termed as a mere "scare" speculations that the International Monetary Fund would impose very stiff conditions on India for the massive loan she is seeking. To say that the IMF would clamp such conditions and India would have to accept all of them, he said was merely "to create a scarce, where nothing exists". That will not, however, satisfy the critics until the agreement terms are made public. One caustic comment on Mr Venkataraman's promise to make public the details of the agreement was : What is the use of knowing a *fait accompli*? If the terms and conditions are to be disclosed, they should be disclosed now".

India has been facing a widening trade gap since 1978-79. From Rs 1,088 crores that year, the figure rose to Rs 2,449 crores in 1979-80 and to as much as Rs 5,400 crores in 1980-81. The Commerce Minister, Mr Pranab Mukherji, even while claiming that exports would go up during the current year from Rs 7,100 crores to Rs 8,400 crores has held out no hopes that this gap would become narrower. India's foreign exchange reserves have remained steady in recent days. However, during the year ended July 31, 1981, foreign exchange reserves declined by Rs 234 crores or 4.6 per cent as against the decline of Rs 571 crores or 10 per cent in the preceding year. The picture becomes somewhat uncomfortable when the decline during the current financial year is taken into account. Between March 27 and July 31, 1981, the foreign exchange reserves declined by Rs 439 crores or 8.3 per cent.

A large part of exports are absorbed by the import bill on oil. During 1980-81 these imports totalled as much as Rs 5,400 crores and there are no immediate signs of the easing of this burden. The Minister for Petroleum, Mr P. C. Sethi, has held out the hopes that by 1984-85 indigenous crude oil production would rise to 30 million tonnes (off-shore 19 million tonnes and on-shore 11 million tonnes), a figure which is just one million tonnes short of the 1980-81 consumption. If the Government is able to curb the consumption growth rate of petroleum products, the gap in the demand and supply would then be nine to ten million tonnes which would have to be imported. There is no guarantee that the world oil prices will remain at their present level in the course of the next two or three years. But it is hoped that they would not rise to an extent where the gains of

indigenous production will be neutralised by the rise in prices.

Some of the critics of the Government have been uncharitable enough to say that New Delhi's recent decision to treble the domestic price of crude oil to Rs 1,182 a tonne was prompted more by the preparations for the IMF negotiations rather than as Mr Venkataraman has explained to curb the consumption of petroleum products and also to meet rising oil exploration costs. It is pointed out that the Government has also cut the fertiliser subsidy, promised to reduce food subsidies, and is pursuing a fairly liberal import policy despite the huge trade gap. These measures, along with credit squeeze and a sharp hike in oil and fertiliser prices, have all been linked, in the eyes of the critics, to the adjustment programmes that the IMF with call for. Such adjustments programmes of the IMF include measures in key and sensitive economic areas : fiscal, credit, incomes, foreign borrowings and exchange rate policies as well as of trade and payments restrictions that are of direct concern to member countries. In the case of the other countries at least IMF has been insistent on this adjustment programme. What is in the bag for India is at present a matter of speculation.

Nepal's biggest ever budget

By BRAHMANAND MISHRA

NEPAL's biggest ever budget of a little over Rs 711 crores for the 1981-82 fiscal year which began on July 26, shows an increase of 93 per cent in development expenditure from Rs 257.3 crores to Rs 533.37 crores. The regular expenditure shows an increase of around 25 per cent from about Rs 142.49 crores to Rs 178 crores. Agriculture, industry and power have been accorded top priority with allocation for agriculture increasing by 114 per cent, from Rs 56 crores to Rs 120 crores, for industry by 600 per cent, from Rs 10 crores to Rs 61 crores, and for power by about 25 per cent from Rs 60 crores to Rs 73 crores.

Presenting the budget the first budget of Kingdom's elected government the Nepalese Finance Minister, Dr Yadav Prasant Pant, said that the proposals were oriented towards consolidating and making the economy self-reliant. Dr Pant, who maintained that the Nepalese Government was committed to remove the distortions that were prevalent in trade, finance and other economic sectors, assured the members of the Rashtriya Panchayat that the government was determined to overcome the hurdles in the implementation of the development projects and also to enforce financial discipline.

Emphasising the need for people's participation in local development, Dr Pant said that the development expenditure for the large projects to be implemented at the national level had been sufficiently increased. At the same time, a sizable amount had been allocated for the projects to be implemented at the local level Dr Pant, who ranks among the top economists of the kingdom, described the budget as designed "to make the economy people oriented". He said "since people's representatives are more capable of identifying and implementing development projects, it is expected that interest of the people in development activities will greatly be aroused by the availability of direct benefits of development".

Referring to King Birendra's speech of June 24, in the Rashtriya Panchayat in which the Nepalese monarch had declared "since the Nepalese society by now has achieved clear political direction, time has come for implementing economic and development programmes with dedication and determination", Dr Pant said "we shall accept the challenge of time and will be able to utilise all our available resources to the maximum extent for the fulfilment of basic needs of Nepali people. However, this goal can be achieved on active participation of the people. Therefore, the local panchayats should also devote their efforts to mobilising necessary participation, for the development of the country is possible only through collective efforts of all".

Later addressing newsmen at the historic Vilayati Baithak of the Singha Durbar, Dr Pant said that, though the budget showed a huge deficit of Rs 261.28 crores,the net uncovered deficit amounted to only Rs 32.5 crores as the government would be taking recourse to heavy borrowing internally and externally. He said, he expected a bilateral loan of around Rs 20 crores, multilateral loans of Rs 158 crores and internal borrowings of Rs 50 crores.

The Kingdom's dependence on foreign aid and loans to finance its development projects continued to be overwhelming. In the current fiscal year, which began from July 26, Dr Pant expects to receive about Rs 318 crores, nearly 60 per cent of the total development expenditure from foreign sources. Dr Pant said foreign aid was necessary to meet the targets set up for the Sixth Plan, and dependence on it would continue for some years to come though the aim was to reduce this component as far as possible. He said priority had been accorded to meeting the basic needs in such areas as drinking waters, schools and health services for which Rs 24.5 crores, Rs 3.9 crores and Rs 20.25 crores respectively had been earmarked.

It had been proposed to increase the pay scales and other facilities of the Government employees to provide some relief to them — Rs 100 to all non-gazetted (including peons), Rs 150 to gazetted class III and II and Rs 200 to gazetted class I employees. All the government employees including civil military and police personnel are to benefit from this provision.

Referring to some major tax proposals, Dr Pant said that income tax exemption limit has been increased for both individuals and families, customs duties and sales tax had been lowered on essential consumer goods like coarse cloth, canvas shoes and kerosene while the levies had been increased on luxurious items like air conditioners, refrigerators, cars, television sets and videos. A rebate of 99 per cent of land revenue had been provided to small farmers holding 1.5 bighas of land. Disparity between import duty rates on imports from third countries and India had been narrowed down considerably on a number of items.

Before it was remitted to the finance committee of the House for a detailed examination, prior to the submission before the House for final approval, the budget was assailed in the Rashtriya Panchayat. Increasing dependence on foreign aid, declining production in agricultural and industrial sectors, and educational, social and other taxation policies were among the issues picked up for criticism by several members who preferred to describe the budget as "impractical, unrealistic and exploitation oriented", and said it only reflected "lofty intentions." In the course of the debate, members expressed concern over dwindling forests, inflation, labour unrest, lack of clear educational policy, rising unemployment, drinking water problem and rampant corruption Mr Pena Cherring Gurung, who was declared elected unopposed from Manang district, said the government should do away with the practice of giving assurances only. Mr Lokendra Bahadur Chand, former speaker of the Rasthriya Panchayat, told the House that a "crisis of confidence has raised its head again in the country." He expressed surprise at the note of optimism struck by the Prime Minister, Dr Surya Bahadur Thapa when "despondency had become all pervasive."

A veteran Panchayat member, Mr Randhir Subba, who is regarded as a likely choice for inclusion in the cabinet, found nothing worthwhile in the budget for local development and Panchayat. There were no measures for consolidating units of the Panchayat system nor any programme to strengthen and promote democracy within the partyless character of the system.

Earlier the Nepalese Prime Minister, Dr Surya Bahadur Thapa, while winding up the nine day debate on the royal address to the first elected Rashtriya Panchayat devoted his statement to hitting out at the critics of the system and of government objectives in the economic development. His statement was regarded as the bluntest ever made against the critics of the system and even somewhat provocative. According to the Rashtriya Sambad Samiti, Kingdom's official and only news agency, Dr Thapa declared that the multi-party supporters who described the new constitution as undemocratic and impracticable were "no force to reckon with. Yet they are welcome if they wanted to join the mainstream by pledging loyalty to the system and the crown".

Dr Thapa told the House that propaganda was being made within and outside the Kingdom that the system was not liked by the people and it was imposed on them. The propaganda, according to Dr Thapa, "sought to make out the problem could be overcome if some kind of compromise was struck with particular individual". The propaganda was done "through foreign newspapers and radio and a situation was being created for external interference in the country's internal affairs."

Though the Nepalese premier did not name any one, it was evident he was referring to the former Nepalese Prime Minister, Mr Bishweshwar Prasad Koirala, popularly called BP. Dr Thapa declared that the solution did not live in striking any kind of compromise with any individual and there was none except the King who could have the last word on the question. Referring to the national referendum Dr Thapa said that it was not held under any pressure nor in response to "demand from any quarter." Not to abide by the verdict of the referendum was "tantamount to undermining democratic practice," he said and challenged the critics to substantiate their allegation that the referendum was rigged. The Prime Minister also said if "some persons do not want to be drawn into the mainstream it is not our fault. This was so because they were startled by the people's decision. They had been alienated from the people."

Meanwhile the predominance of foreign assistance is seen as a disturbing phenomenon in the Kingdom which, among other things, has corrupted the thinking values and attitude of the people. This was vividly brought out in two papers presented at a seminar held recently on current issues in Nepalese development, organised by the Centre for Economic Development and Administration, Tribhuvan University.

The papers discussed a number of issues like the impact of foreign aid, development performance and domestic resource mobilisation for development. "Foreign phobia has become so extensive today that there is no sector or area that is free from its influence" one paper said. It noted the few projects that were being implemented were under some foreign assistance or the other. Further, foreign aid provided access to many commodities and projects normally not feasible with domestic resources. Cited among such projects were air ports, hotels, urban sewerage — "all far from the goals of fulfilling basic needs but not far from prestige needs of the elite."

What direction Pakistan's economy?

By B. M. BHATIA

AN interview with Mr Ghulam Ishaq Khan, the Finance Minister of Pakistan published in the Karachi weekly, *Pakistan Economist*, in its issue of August 1, 1981 provides important clues to his thinking on some of the important economic issues facing his country. The questions asked of him ranged from the directions of the country's present economic policies to the reported inflexibility in views that the Finance Minister was known to have.

Asked to define direction of the country's present economic policy, the Finance Minister stated that over the last four years the main aim of the economic policy of the country over the last four years had been "to make a determined and disciplined effort to revive, consolidate and restructure the economy." This was the immediate goal. "At a more fundamental level," he went on to add, "we have been trying to lay the foundation for a socio-economic order along the lines ordained by Islam."

The three pillars on which he wanted to build up the economic edifice of the country were, as he put it, "equity, effort, and efficiency." The aim of the Government in the economic field was "to bring about an improvement in the standard of living of the people, usher in overall prosperity and attain increased self-reliance and technological advancement so that in the long run we have a self-sustaining Islamic society based on justice, equity and human well-being."

These are well-worn cliches mouthed by politicians of the Third World countries every where and add up practically to nothing in reality. That much was clear from his own statement when he said: "The question of 'span of time' over which this is to be achieved is a more complex one. The challenge of economic development will remain with us for decade." Later in the statement, he went on to say that to make a significant improvement in living standards of the people in the country, it will take "a short period" of one generation or more. Even that would be possible only if the country is not subjected any more "to high voltage external shocks, in which

case the process may drag on longer and beyond the time spans set......"

On the basic question of the need to correct the inherent imbalances from which the economy suffered, he had practically nothing to say to suggest that there was even realisation, on the part of powers that be, of the urgency of the problem. This is surprising because the Ministry's own *Economic Survey* for the year 1980-81 had drawn pointed attention to the "several structural weaknesses" from which the economy suffered and had called for pursuit of policies that would "correct the structural imbalances in the economy."

Overspending is the biggest problem of Pakistan. From this single fact flow all other economic problems that the country faces. The Government spends more every year than what it gets by way of its revenues. That gives rise to deficit financing on the one hand and foreign borrowing on the other. People spend more on current consumption than what a developing country could afford to do. That reduces the rate of saving and creating a wide gap between investment and saving levels in the country. What is Pakistan Government doing to stop the spending spree in the country is the question that needs most to be answered. Unfortunately, it is precisely on this subject that the interview discloses the Finance Minister to be at his weakest. He does not even accept the fact of overspending by the nation. Inflation and heavy annual external payment deficits are due to external environment and forces at work which are beyond the country's control, according to him. The Government, he feels, has little responsibility in the matter nor can it do much to control the situation.

To begin with, take inflation for instance. At the time of publication of the budget at June end, the inflation rate in the country was 13 per cent. This in itself should have dissuaded the Finance Minister from administering a further heavy dose of deficit financing or raising the administered prices of various necessaries of life sold through the public sector. And this is precisely what he did. When asked to comment on this contradiction between the professions of the Government and its performance on the subject, the Finance Minister, instead of giving a straight and cogent answer indulged in a long-winded comment on the nature and causes of inflation in Pakistan as he saw them.

There were three facts about inflation to be remembered. The first was the structure of prices. High support prices offered by the Government for wheat, rice and sugarcane had brought about increase in agricultural production. This increase in supply brought about by rise in prices could not lead to fall in prices. Of course, subsidies could be given to keep down prices of wheat, sugar and other articles of daily consumption. But subsidies on a wide scale are not possible or even desirable because "if subsidies are financed from deficit financing the effect is just as inflationary." Besides, "distortions in prices from real costs have all kinds of adverse resource allocation effects." This argument would wash if the Finance Minister were avoiding deficit financing or at least trying to reduce it. As things stand, the current year's budget deficit is the highest in recent years.

To the charge that deficit financing is being heightened instead of being reduced the Finance Minister had no reply and parried the accusation by stating that alternative to deficit financing of the level they were having in Pakistan was taxation of even more regressive nature than deficit financing was and that the level of deficit financing indulged in by the country could not be described excessive as "projected deficit financing of Rs 5,444 million in 1981-82 would constitute about 1.7 per cent of anticipated GDP and around 9 per cent of the Federal Governments expenditure, compared with 4 per cent and 20 per cent in 1976." But why not reduce public expenditure, especially on defence, to eliminate deficit financing altogether? This question was not posed for obvious reasons. Deficit financing by a developing country can at best be justified to meet a part of developmental expenditure and not extravagant consumption expenditure. This simple truth does not seem to carry any weight with Pakistan ruling elite.

The other immediate problem facing Pakistan economy is the annual external payment deficit. On this question again the Minister tried to play down the gravity of the situation by stating that the situation by no means was alarming. On the contrary things were improving: "Exports (in the last two years improved) at the rate of 30 per cent, more than half due to volume; imports by 20 per cent entirely due to prices. The current account deficit in the balance of payments, despite the deterioration in global economic environment did not worsen." He forgot that his statement on the subject implied further worsening of country's terms of trade which could not be a matter of satisfaction to him.

Secondly, the question is not of further worsening of balance of payments position which is already serious. What is important to know is what is being done to improve the payment position and extricate the country from abject reliance on increasing flow of foreign aid. The seriousness of the present situation was admitted by himself in another part of his interview when he stated: ".....net aid transfers to Pakistan declined from $766 million in 1975-76 to $347 million in 1980-81. At the same time, the net non-project transfers were transformed from an *inflow* of $388 million to an *outflow* of $504 million." (Italics added) That showed the true gravity of the country's external payment position which unfortunately fails to merit even a thought from the Finance Minister.

The most astounding part of his answers to the interviewer's questions related to the relevance of economic principles to the fiscal and economic management of the country's finances. Told that people believed he was rigid and inflexible in his views, he had the following comment to make: This charge against him is "not correct in the sense that I have never allowed myself to be immobilised by theory. I have always followed a pragmatic and practical approach without of course losing sight of basic objectives and fundamental principles and that automatically implies flexibility." In other words, he was concerned to live in the present and not bother about the consequences of his actions and policies to the future of his nation.

Bangladesh: Marginal drop in population growth

From A. ZAKERIA SHIRAZI

DACCA

THE preliminary report of the second census of Bangladesh was published recently. The census was held on March 6, 7, 8, 1981. Although the previous census had been due in 1971 it was not held till 1974 because of the liberation war. Thus the present preliminary result gives a picture of comparative septennial rather than decennial growth. A total of 206,000 enumerators, with 5 per cent reserve, under 46,000 supervisors worked for three days in 801 "census zones" of the country and obtained data whose findings carry the following highlights.

The population of Bangladesh, according to the preliminary report is 8,70,52,024 the sex ratio being 106 males for every female. However, the report says that allowance should be made for under-enumeration which, it says, is the practice in census enumeration in almost every country. A post-enumeration survey conducted within fifteen days of the census showed that 6 per cent people in urban areas and 3 per cent people in rural areas and in total 3.32 per cent people were left out of the census. After adjustment of the under-enumeration total population has been estimated at 8,99,40,000.

The population highlights (without adjustment of underenumeration) are the following :

	1981	1974
Total population (in thousand)	87052	71479
Number of households (in thousand)	1535	12679
Average number of member in each households	5.7F	5.64
Population per square mile including river area	1566	1286
Population per square mile excluding river area	1675	1375
Per capita land (acre)	0 38	0.47
Annual increase on the basis of adjusted population %	2.36	2.70

The publication of the report has given a moment's relief to the economic planners of Bangladesh. Where result had been predicted and annual rate of growth was so long assumed to be 2.80 it turned out to be 2.36 as indicated by the census report. But experts also concede that any euphoria over the somewhat lessened pace of growth is not only premature but positively harmful. Population has been declared the "number one" problem of the country. Most ministries have a population cell and a National Population Council has been formed headed by the President of the country.

All development efforts are being threated by the demographic swell and there is no sign of any increase in per capita income or over-all economic improvement. Detailed statistics about literacy, employment, etc are awaited. The previous census of 1974 showed that though 5 million more people had become literate in 13 years, the percentage of literacy was only marginally up from 19.9 to 22.2. The growth of population had offset any gains in absolute terms. The statistics regarding literacy, when they are published, will assume special significance because of the Government's much heralded campaign launched last year to universalise literacy within five years. Only skepticism greeted such an impossible target.

In another overzealous bid the Government declared two years ago that all-out efforts would be made to stabilise population at 10 crores. Not only was the target impractical but it was not matched by concrete steps aimed at drastic reduction of growth rate.

Significantly, while the cause for the slightly slowed rate of population growth is yet to be determined, no one is eager to give credit to the family planning department. Surveys have shown that the percentage of fertile couples who adopt family planning is no higher than 15 and accepters of sterilisation would be around 2 per cent of the fertile couples who number 16 million. At best family planning could have had a marginal impact so far. At present and in the foreseeable future population will continue to be the most urgent national concern.

Growth of tourism in South Asia

By DALTON DE SILVA

REPRESENTATIVES of the tourist industry and officials of government departments from five South Asian countries met in Sri Lanka recently to discuss their common problems and came up with several recommendations for the development of tourism in this region.

The three-day regional meeting organised by the California based Pacific Area Travel Association (PATA) in collaboration with the Sri Lanka Chapter of PATA and the Tourist Board of Sri Lanka was attended by 50 delegates from Bangladesh, India, Nepal, Pakistan and Sri Lanka.

Mr Lakshman Ratnapala, Director of Chapter Services of PATA, told a news briefing after the conference that this was the first time that senior officials of government departments outside tourism had sat together with leaders of the tourist industry to discuss areas of common interest on a regional basis

The conference, which had as its theme the place of tourism in South Asian development, discussed a wide range of subjects relating to the travel trade from the role of government in tourism to "tourism and the economy" and the relationship of tourism to the work of the immigration, customs and civil aviation departments.

India was represented by a top level delegation from both the tourist industry and the government sector. Tourism consultant, Mr S. N. Chib, spoke on the relationship of tourism to development goals of South Asia while Mr S. V. N. Ranga Rao commercial manager, Air India, presented a paper on the role of transport in tourism. Mr Inder Sharma, chairman of Sita World Travel Pvt Ltd of New Delhi, spoke on regional cooperation in tourism.

Senior officials from the departments of tourism, airports authority, civil aviation, immigration and customs of the Government of India, who attended the conference, also participated fully in the discussions, a conference spokesman said.

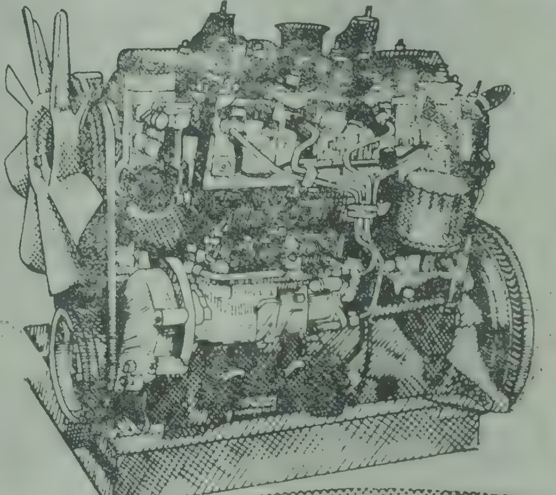
Mahindra now brings you the Peugeot XDP 4.90- a diesel engine of advanced design

Mahindra meets the challenge of the oil crisis, with a superb new, lightweight high performance diesel engine-the PEUGEOT XDP 4.90 with greater fuel efficiency.

This world-famous engine is now being assembled at the Mahindra plant.

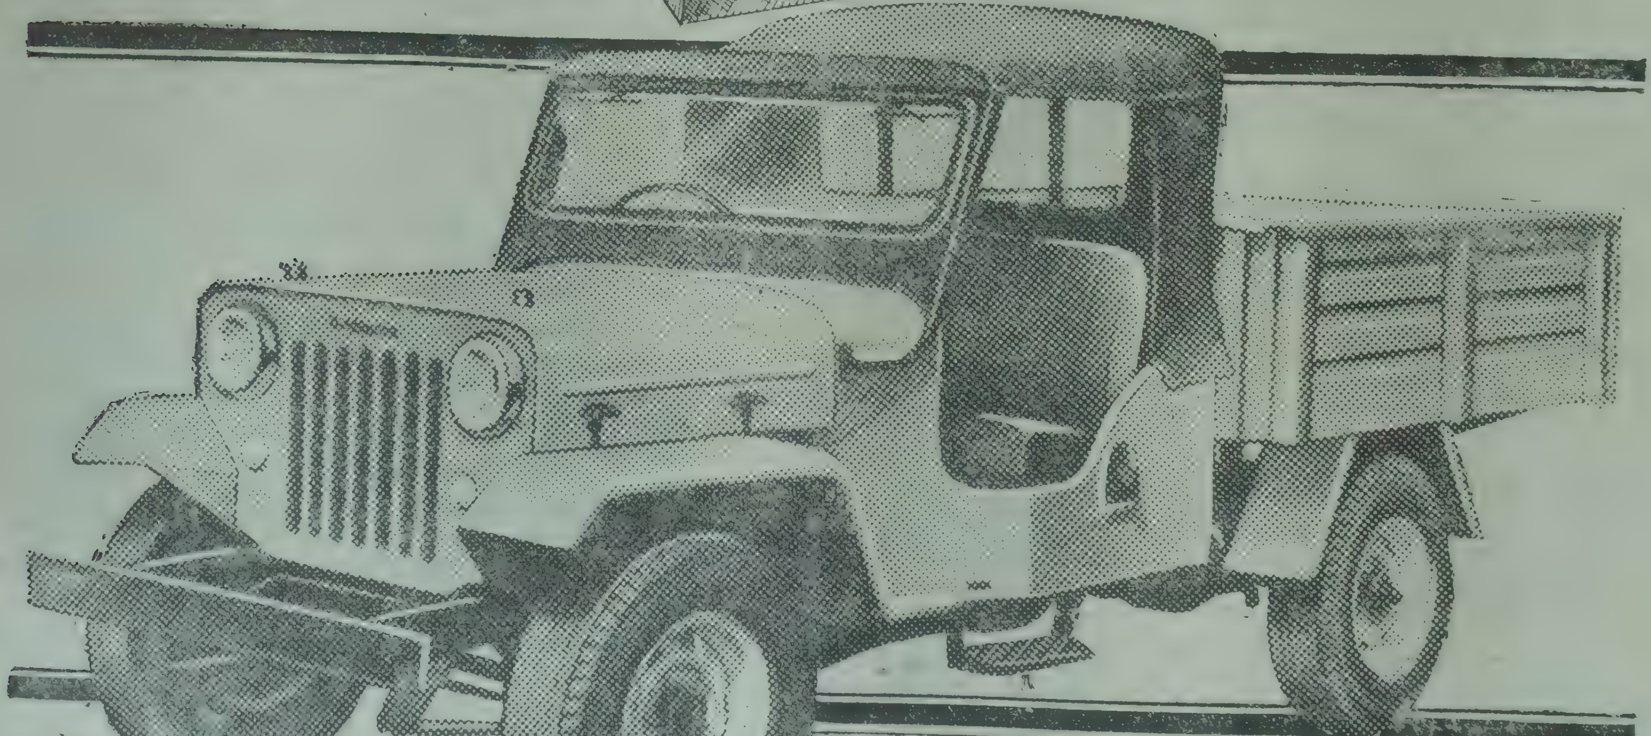
The PEUGEOT XDP 4.90 will be fitted initially on the **Mahindra** NC 665 DP Mini Truck, Pick-up Van and Ambulance.

By far the most vital factor is the greater fuel efficiency of this lightweight, high performance engine.



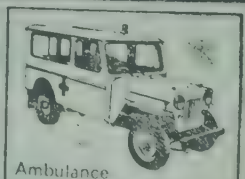
Engine Specifications :

No. of Cylinders	4
Bore-mm	90
Stroke-mm	83
Bore Stroke ratio	1.08
Displacement-cc	2112
Compression Ratio	22.4:1
R.P.M. (max)	4500
Max. B.H.P.	75
Max. Torque Kg.m.	13.3 @ 2000 r.p.m.
Weight Kg.	184



The Mahindra NC 665 DP Mini Truck fitted with Peugeot XDP 4.90 diesel engine

Pick-up Van



Ambulance

Mahindra & Mahindra Ltd.

A statistical summary of South Asian tourism placed before the conference showed that the number of visitors to the five countries increased from 492,000 in 1970 to 896,855 in 1975, and jumped to 1,649.582 last year. Of the tourists who visited the South Asian countries last year, Bangladesh received 65,760, India 800,150, Nepal 162,880, Pakistan 299,012 and Sri Lanka 321,780.

Comparable figures indicated that Sri Lanka had an unprecedented growth rate of tourism of 28.6 per cent last year compared with the previous year while the growth rate in Bangladesh was 15 per cent, India 4.6 per cent and Nepal 0.4 per cent. Pakistan had 6.1 per cent less tourists last year than in the previous year.

Mr S. N. Chib of India told the conference that Sri Lanka's growth rate of tourism has been the highest in the last 10 years, not only in Asia but in the world as a whole. "It was 25 per cent to 30 per cent even in the last two years when it was almost stagnant in the rest of the region." What is more significant, he said, is that the length of stay in Sri Lanka is more than 10 nights, higher than in some of the larger countries of Asia.

Of the 1,649,582 tourists who came to South Asia last year as many as 712,586 were from Europe comprising 43.2 per cent.

The average spending by tourists per day in the five South Asian countries in 1979 was $ 21.5 in India, $ 18.4 in Pakistan, $ 28.2 in Sri Lanka, $18.1 in Nepal and $ 5.8 in Bangladesh. This was low compared with the level of spending in most other countries in the region — Singapore ($ 77.5), Thailand ($ 67.8), Hong Kong ($151.5), Philippines ($26.2), and Indonesia ($ 59.5).

Mr H. M. S. Samaranayake, director general of the Sri Lanka Tourist Board, speaking on the impact of tourism, told the conference that the low spending by tourists in the South Asian countries was partly explained by the illicit trafficking in foreign exchange due to the existence of a black market and the lack of opportunities for shopping and entertainment.

The conference in its discussion on the role of government in tourism also considered how cultural pollution or the evil effects of tourism like prostitution, nudism and drug pushing could be controlled. Sri Lanka Minister of State, Anandatissa de Alwis, who opened the conference, had drawn the attention of the delegates to this problem among others.

The conference felt that governments had a regulatory role to play when they perceived the national interest affected. It said this regulatory action by government should, however, be kept to the minimum level necessary to bring a given situation under reasonable control.

As the tourist industry grew it attracted elements that had short-term profit motives which conflicted with long-term national or industry interests. The tourist industry should, therefore, devote attention to the establishment and effective operation of self-regulatory mechanisms, reducing thereby the need for statutory controls it said.

"Regulatory systems should not be cumbersome or unenforceable", the conference recommended adding "where controls can be established without the requirement of legislation, this should be encouraged". It also said that consultation between government and industry in the establishment of regulatory systems was desirable.

While recognising the pre-eminence of national security considerations in the work of immigration departments, it said considerable progress was possible in the area of the standardisation and simplification of forms and procedures on a regional as opposed to the present national basis. The conference supported the introduction of a standard entry and departure card and where possible of the carbonised paper form which eliminated the need for departure card completion. The professionalism of the immigration and customs staff and the upgrading of the equipment they use could contribute considerably to improving "the visitor experience", it said. The conference recommended that where visas remain necessary, attention should be given to expediting their issuance.

While accepting security checks as an accepted part of airport departures, the conference said specialised staff and equipment could reduce visitor inconvenience.

The conference applauded the introduction of two channel customs clearance system and advocated the introducting of similar systems throughout the region.

MFA or imports at minimum prices?

Concluded from page 326

Common Market sources refuse to take the idea of "threshold" prices seriously. But the fact that it is being put forward at all points to a dissatisfaction with the MFA. Among the arguments being invoked against its continuation are the following:

(1) The MFA is essentially an American invention, based on the hypocritical principle of self-restraint. However, the quantities involved are so large now that exports can no longer be regulated in this way. In any case, with the market for many items seasonal rather than annual, it is unrealistic to fix quotas for a 12-month period. Exporting countries, by concentrating their sales over a very short period, can completely disrupt the market.

(2) The developing MFA countries account for only a limited proportion of the Community's total imports. The real beneficiaries of the restrictions imposed on the developing countries are more likely, therefore, to be other industrialised countries and *not* the European industry. Major beneficiaries in fact are Spain and Portugal. The US is another: as Hongkong has pointed out. US prices are lower even than those of developing countries for a number of textile and clothing items.

(3) The proliferation of import quotas is both unhealthy and an invitation to fraud. Fraud in fact is bound to increase as more and more products from more and more exporting countries are made subject to quotas. The growing complexity of the system is certain to make its operation increasingly difficult, and it may well collapse under its own weight.

These arguments are very different from the ones which the EEC's representatives are putting forward in Geneva. It is obvious, however, that the system of bilateral agreements operated by the Community is already a very complex one, and as such probably hampers the flow of trade. Instead of simplifying it, the EEC seems determined to make the system even more complex.

Disciplining bank employees

SIR,—Recently the State Minister for Finance had a discussion with the chief executives of financial institutions on the need to discipline the staff and better the customer service. It is felt that the climate created by the Essential Service Maintenance Ordinance should be utilised to bring about this.

Is discipline confined only to staff? Is there no indiscipline at other levels and in the public life? Can the ordinance bring about discipline?

Customer service in banks is not confined only to service at the counter. Delay, indecisions, and indifference to advances proposals specially when they are for small loans, and to complaints has affected customer service. This is not handled by staff. A growing feeling in the public is that complaints do not receive any attention but result in pinpricks later on. So they would rather not complain.

Recently there were few cases of students approaching higher authorities when they failed to get a response from the manager for educational loans. Later on the manager told the students that if they do not recommend their proposals, higher ups could do nothing. They took the stand that because students had approached the higher ups they would not recommend. Higher ups said that if the manager recommends then only they could sanction the loans. Here it is not the indiscipline of the staff that came in the way of customer service.

Many a time indiscipline of the staff is the result of indiscipline at higher levels. Delayed decisions, biased decisions and indecisions on staff matters are resented at the lower level. This results in a grievance, but the grievance is not promptly looked into.

Placement, transfers and promotions are not fair according to many staff members. They point out how in many cases orders of transfer or placement are cancelled after lobbying by the concerned. But in other cases they had to go to the place as per orders. They feel lobbying is necessary for promotion. It is reported that lobbying is necessary even for the appointment of chairman.

To The Editor
LETTERS
COMMERCE WEEKLY

Nariman Road, Bombay-400 020.

There were reports that the affairs of a nationalised bank had reached a point of deadlock in the absence of a full time chairman when the appointment was delayed. This resulted in inner feuds among the top officials. There was no team spirit at the top. This was the result of delay and indecision at the ministry level. Has the ordinance created climate to avoid such a situation which results in indiscipline? Then what about indiscipline of the rules?

Indiscipline is not the monopoly of the staff. It is the reflection of indiscipline everywhere.

Black money

SIR,—So long as there is the ballot-paper democracy needing lot of funds which are met only through black resources, there is little hope of eradicating it. The sources of black money are licensing of permits and quota system, restrictive trade practices, restriction on movements and the flood of stringent legislations with unlimited powers to bureaucrats. The economy of scarcity or shortages has been the main plank of our planning and these shortages are ever widening—you have to pay a premium of Rs 1,000 on a scooterate, Rs 7,000 on a Premier Padmini or Rs 15,000 on a Mahindra Jeep due to price control. The eradication of black money can be attained if all these restrictions on production, movements, permits and quota systems, licensing systems and the spate of thousands of restrictive laws are done away with. Anyway who wants it? All talk of black money is an eye-wash.

Controlling inflation

SIR,—The anti-inflation measures are not likely to be effective in controlling prices. Except import of wheat and edible oils—and we should compliment the Government on the quiet and businesslike manner in which wheat purchases were made at low world prices—the other measures will either be marginally effective or trigger off fresh inflation as in the case of petroleum product price increase.

The main reason is that the roots of inflation are untouched. Inflation has arisen primarily from uncontrolled government expenditure—both Central and State — and consequent deficit financing.

A new set of remedies is required. Briefly, government should :

(1) give up all unnecessary activities.

(2) concentrate on improving production and productivity in crucial sectors—railway transport, power, coal, banking and insurance service, post and telegraph and telephones.

(3) sell 49 per cent of public sector shares to employees and public and give the units autonomy (consequently, no government funds from tax-payers' money or deficit financing), and

(4) introduce modern management practices in government. For instance, a 5 per cent improvement in handling Central revenues will mean improved cash flow of Rs 1,000 crores. It is a pity that a 200-year old treasury system is run on outdated rules blocking crores of rupees unproductively.

Special Reports

Resources for private sector

From OUR SPECIAL CORRESPONDENT

BOMBAY

THE private corporate sector has been assigned an important role in the Sixth Plan period. In view of the resources constraint being faced and likely to be faced by the public sector financial institutions, the private corporate sector is expected to be mobilise more resources on its own than in the past years. In this context, the workshop on "Resource mobilisation in the private corporate sector" held in Bombay on August 8 under the auspices of The Associated Chambers of Commerce and Industry in India assumed added significance.

At this workshop, which was attended by captains of industry, besides the Governor of the Reserve Bank of India Dr I. G. Patel, who presided over the workshop, and officials of the Reserve Bank of India, the Industrial Development Bank of India, the Industrial Credit and Investment Corporation of India, The Industrial Finance Corporation of India, The Life Insurance Corporation of India, The Unit Trust of India, some nationalised banks as also some prominent industrial and financial consultants and financial journalists, several useful suggestions were made to revive the capital market, which is so very necessary for helping the private corporate sector to mobilise resources on its own, as also for helping it to plough-back its own resources through necessary changes in the fiscal and monetary policies.

Dr Patel suggested that some nationalised banks like the State Bank of India, Bank of Baroda and Bank of India, can be permitted to accept deposits from abroad at rates prevailing in the international markets, with a provision to repay these deposits in foreign currencies in which these were received. Dr Patel said these banks could hold such deposits on behalf of the Government of India. He pointed out that as it is, the Government was currently resorting to commercial borrowing abroad. He was confident that several investors, including non-resident Indians and Indians residing abroad, could be attracted to keep their funds as deposits with Indian banks.

Dr Patel said that such a step had become necessary in view of the resource constraint experienced by term-lending institutions like the IDBI. He suggested that the Indian banks could issue deposit certificates for six or twelve months by paying higher interest than they were currently paying on such deposits in India. Such funds could also be utilised for the use of Indian private entrepreneurs who were currently borrowing abroad or who were setting up joint sector projects in other countries. Dr Patel thought that we should take advantage of the liquidity in foreign financial markets which had developed mainly due to the growing oil surpluses.

Dr Patel pointed out that the term lending institutions did not have at their disposal unlimited resources. The Reserve Bank of India had been making available to them Rs 200 crores to Rs 250 crores per annum from its own profits and banks had been subscribing to their debentures and bonds. He pointed out that a deliberate structure had been created for providing funds to the private corporate sector at concessional rates. However, since there were limits to RBI profits as also limits for raising resources by issue of bonds, financial institution would have to evolve criteria for rationing their assistance in accordance with certain prescribed priorities. He said it was against this background that resort to foreign financial markets acquired significance. He said there was need to step up the national savings and those of the corporate sector itself.

Referring to the plea made in several quarters that enough credit should be made available to large industries, the

RBI Governor pointed out that large industries were not denied credit facilities. In fact, credit support to small industries was not what it should be. It was the small industry which was suffering in terms of relative importance. He suggested that instead of asking for more credit, industrialists should attempt to restrict their demand for credit. particularly because bank lending had become quite costly. They should ask their executives to plan accordingly.

Dr. Patel made it clear that the credit policy would have to remain tight and that the Tandon and Chore Committee norms would stay. He pointed out that high interest rates and restrictive credit policy discouraged holding of inventories. The dear money and restrictive credit policies had discouraged misdirection and mis-utilisation of credit to a great extent. He also pointed out that in the context of the present economic situation in the country, industrialists would have to reconcile to a fairly high level of taxation and high level of interest rates. He however, favoured a stable tax system.

The RBI Governor said a high interest rates structure was necessary to divert savings from less desirable to more desirable channels. Presently, unnecessary investment was being made in inventory and residential accommodation. Concealed income was being used for acquiring real estate. To prevent such unhealthy practices, he suggested that it was necessary to bring out legislation to the effect that no residential property could change hands unless there was an open auction held by the government.

Dr Patel said a study could be undertaken to disaggregate the household sector and define a link between the household sector and the corporate sector for channelising the savings of the former to the latter. He said total savings in the economy and particularly in the various sectors which would generate resources for the corporate sector, should be studied. Efforts would have to be made to see if savings generated which were currently used for unproductive purposes could be diverted to the corporate sector for productive purposes. This could be achieved by discouraging investments in inventories and residential accommodation, he felt.

In his welcome speech, Mr A. Sivasailam, President of *ASSOCHAM*, said that the private sector would be able to fulfil the role envisaged for it in the Sixth Plan, only if drastic changes were effected consciously with sympathy and understanding in both fiscal and monetary policies.

Mr Sivasailam pointed out that the workshop had been organised to discuss the study on resource mobilisation in the private corporate sector made by the National Institute of Public Finance and Policy.

The study has been conducted by a team of economists headed by Dr V. D. Lall, who was the project leader. The other members of the project team were Srinivasa Madhur, K. K. Atri and Ranjana Ghoshal. Dr R. J. Chelliah, Director of the National Institute of Public Finance and Policy, took keen interest in the project throughout its duration and drafted some chapters jointly with Dr V. D. Lall.

Mr Sivasailam pointed out that the study clearly belied the popular impressions regarding the financing pattern of companies in the large sector. It revealed that corporate savings consisting of depreciation and internal plough-back including bonus shares accounted for 64 per cent of the gross resource mobilisation. Long-term loans accounted for 7.2 per cent, debentures 1.9 per cent and fresh equity capital 5.7 per cent.

He pleaded for a reduction in corporate tax and for higher rates of depreciation. He said in the context of paucity of funds and a steady rise in prices, industrial units had limited choice to use their long-term resources mobilised for working capital purposes. He said reduction in corporate tax and higher depreciation were not alternatives but complementary. The proportion between the two would vary from company to company. He pointed out that higher depreciation in a particular year would not result in reduction in tax but would mean postponement of its collection. He called on the authorities to look to the issue dispassionately.

Mr Sivasailam said the private sector had an important role to play. We would have to consider whether targets set for it could be fulfilled, whether the current policies were conducive to achieve the targets and whether any modifications were necessary in policies to achieve the desired objectives.

Corporate profits

Dr R. J. Chelliah and Dr V. D. Lall explained the major conclusions of the study. The study points out that corporate savings consisting of depreciation and internal plough-back (including bonus shares) accounted on the average for 64.2 per cent of gross resources during the period of the study (1962-63 to 1975-76). Such a high proportion of corporate savings is partly due to the low level of capital formation which did not require much resource to be made to external resources, as also due to the rising value of new capital assets resulting in increasing monetary value of chargeable depreciation.

Gross fixed asset formation by the companies selected in the sample during the 14-year period amounted to 66 per cent of gross resources mobilised during that period and 92.8 per cent of gross resources of a long-term nature. The annual rates of fixed capital formation and additions to plant and machinery in real terms formed a declining percentage of the existing capital stock. Sectoral analysis has revealed that the size of a company seems to have a bearing on both the level and pattern of resources mobilisation.

The study points out that action would have to be taken on several fronts in order to bring about conditions in which the corporate sector could grow more vigorously so that its contribution to domestic investment and savings could rise over the years. One of the important areas in which remedial action can be taken relates to the taxation of corporate profits. It has been pointed out that the effective tax rate has an important bearing not only on the volume of resources mobilised but also on the ratio of equity to debt finance and that of retentions to fresh issues.

The finding of the study is that the market for equity capital has not been growing in line with the requirements of the corporate sector. It suggests that if the corporate sector is to grow and flourish under healthy conditions, it would be necessary to revive the equity market. Several suggestions have been made to revive the capital market. These include extension of the scope of investment by corporate and individual shareholders, raising the exemption limit of dividend income for computing the tax base and creation of a bond market.

It has also been suggested that the question of granting an adequate measure of short-term credit for inventory financing by the manufacturing corporate sector should be reconsidered in the light of the steep increase in the prices of inputs. Denial of short-term credit would lead to diversion of long-term funds to short-term purposes, with undesirable implications for the growth of investment.

Mr N. N. Pai, chairman of the industrial Development Bank of India (IDBI), stressed the need for resource mobilisation by the private corporate sector, which was currently small. He said it was desirable that the corporate sector should tap savings of the household sector through the capital market.

Mr Pai said the criticism that the convertibility clause hindered capital formation in the private sector was outdated. In the last 16 months, the financial institutions functioned in such a manner that their cumulative holdings in an enterprise did not exceed 40 per cent. He pointed that financial institutions were interested only in financing growth of the industrial sector. They were not interested in the take-over of units if these were run efficiently, with due regard to social priorities and overall government policies. They were, however, interested in ensuring that the assisted companies followed sound managerial practices.

Funds from abroad

Mr Pai said there was no clash of interests between the financial institutions and the assisted units. On the contrary, their interests converged. It was only fair that the financial institutions should share the prosperity of companies assisted by them. He emphasised that the financial institutions would do everything possible to promote industrial development.

Mr H. T. Parekh, former chairman of the Industrial Credit and Investment Corporation of India, said that the gap between the resources likely to be mobilised by the corporate sector and its needs in the Sixth Plan period was likely to be Rs 400 crores to Rs 450 crores. He agreed that the capital market was now capable of providing more funds for the growth of companies. However, efforts would have to be made to tap more and more funds not only in the domestic market but also from abroad. He suggested allowing companies to have accelerated depreciation whenever they made profit. This was necessary because the year-to-year change in the profitability of a company had an impact on new capital investment.

Mr Parekh was happy that the trend noticed till recently to have less and less equity was changing and that equity base was expanding. He said there was good scope now for companies to raise resources from the capital market through issue of new capital or bonds.

Mr M. S. Patwardhan, a former president of the Bombay Chamber of Commerce and Industry and managing director of NOCIL, said there were psychological and non-financial factors which were impending the growth of the corporate sector. He pointed that the MRTP and large companies were using their funds for working capital because they were not getting licences for expansion or diversification. Price control in industries like cement, sugar and pharmaceuticals had affected even large units. He said unnecessary controls should be dismantled. The stiff import duty on capital equipment was nothing but a tax on development, he said.

Mr Patwardhan suggested that the limit for acceptance of deposits by companies should be raised from the present level of 35 per cent of their capital and free reserves to 45 per cent. Providend funds and super annuity funds should be allowed to put in 10 to 15 per cent of their investible funds in secured debentures of companies. This would a long way in helping companies to raise funds through debentures and bonds, he said.

Mr Raunaq Singh, noted industrialist, said that the recent anti-inflationary measures like the hike in petroleum product prices would lead to an increase in industrial costs. He said the capital market must become more vigorous. He suggested that bank advances against shares should be allowed.

Mr Raunaq Singh pointed out that the dividend was taxed twice — first at the company's level and second at the individual's level. He felt that if the tax on dividend was done away with for the individual, it would help reviving the capital market to a large extent.

Dr R. K. Hazari, a former Deputy Governor of the Reserve Bank of India, expressed unhappiness over the methodology or conclusions of the study. He pointed out that the real growth rate level had fallen since the 1960s. He suggested that in order to give appropriate return to the investors, the Life Insurance Corporation of India should emulate the example of the Unit Trust of India. He felt that the monopoly of the LIC should be broken and large organisations should be permitted to have group insurance of their employees on their own.

Dr Hazari said there was no alternative to higher capital formation. He, however, cautioned against present buoyancy in the stock exchanges. He said he was strongly opposed to lowering of bank deposit rates in an effort to make investment in equities more attractive. He said high taxation was not a path to socialism.

Dr Hazari said Tandon and Chore Committee norms should be applied more vigorously. He said financial institutions should accept the logic of these reports. He pointed out in many cases financial institutions did not provide margins needed under the Tandon or Chore Committee norms.

Reserves

Mr M. P. Chitale, a tax expert, suggested that companies having modernisation programmes should be allowed to create earmarked reserves. He said it should be ensured that resources were used properly and efficiently. He felt that for growing companies, the current tax structure was not high. On the contrary it was favourable. He said in many cases, poor profitability was not the result of inefficient management but mainly because of government policies. He said investible funds would naturally flow to companies with high profitability from those with low profitability.

Mr Chitale said currently the equity market could not cater to an investor who wanted to have income. Development of an active capital market with various types of instruments for different types of investors was necessary, he said.

Dr P. R. Brahmananda, a noted economist, said reduction in taxes and higher depreciation allowance would have to be considered in the larger perspective. He suggested that the working of banks and financial institutions should be made more economical. Currently, banks and financial institutions were not mobilising funds, they were only lending funds. He advocated a higher interest rates structure.

Prof Gangadhar Gadgil, a business economist, said the most important was profitability of a company. He said indirect taxes and price controls affected profitability much more than direct taxes did. He suggested that study should be undertaken to know from where money was coming to equity issues.

Mr N. C. Chaudhari said it was necessary to make the cake bigger before making arrangements for distributing the same.

Mr Bhattacharyya suggested that the first 500 large companies should be asked to have inflation-corrected balance sheets.

SCI crosses 5 million dwt mark

BOMBAY

THE Shipping Corporation of India's (SCI) tonnage crossed the 5 million dwt mark on August 12 this year with the acquisition of a medium range tanker, 'C. V. Raman' from the Mitsubishi Heavy Industries Ltd, Kobe, Japan. The SCI has ordered another tanker of the same class, called Homi Bhabha.

Addressing a press conference to mark the occasion, Vice Admiral R. K. S. Ghandhi, vice-chairman and managing director of SCI, said his organisation today ranked among the biggest shipping companies in the world and was the fifth largest liner company in the world. SCI crossed the first 1 million dwt mark in 1970, 2 million dwt in 1973, 3 million dwt in 1975 and 4 million dwt in 1976.

He said, SCI had a big expansion plan for the Sixth Plan period. SCI had submitted a proposal for the acquisition of 47 vessels involving a financial outlay of Rs 800 crores. The vessels would comprise container oriented cargo liners, fully containerised vessels, tankers and bulk carriers.

In 1961, SCI began with a modest fleet of 19 vessels totalling 0.19 million dwt. These vessels operated a limited number of cargo liner services to Australia, Japan, USSR, Poland and UK/Continent, passenger services to Malaysia and East Africa and tanker services along the Indian coast. As India's trade pattern changed in the ensuing two decades, SCI ordered and acquired cargo liners, container oriented cargo liners, bulk carriers, combination carriers, crude carriers, product carriers, very large crude carriers, passenger-cum-cargo vessels and timber carriers. SCI today owns a fleet of 147 vessels of 5.02 million dwt.

SCI has network of cargo liner services covering all continents except South America Vice Admiral Gandhi said, SCI was prepared to start a service to South America provided the ships got remunerative cargo on the way back. He said, he had sounded the Argentinian and Brazilian national lines during his recent trip to South America and received a favourable response from them.

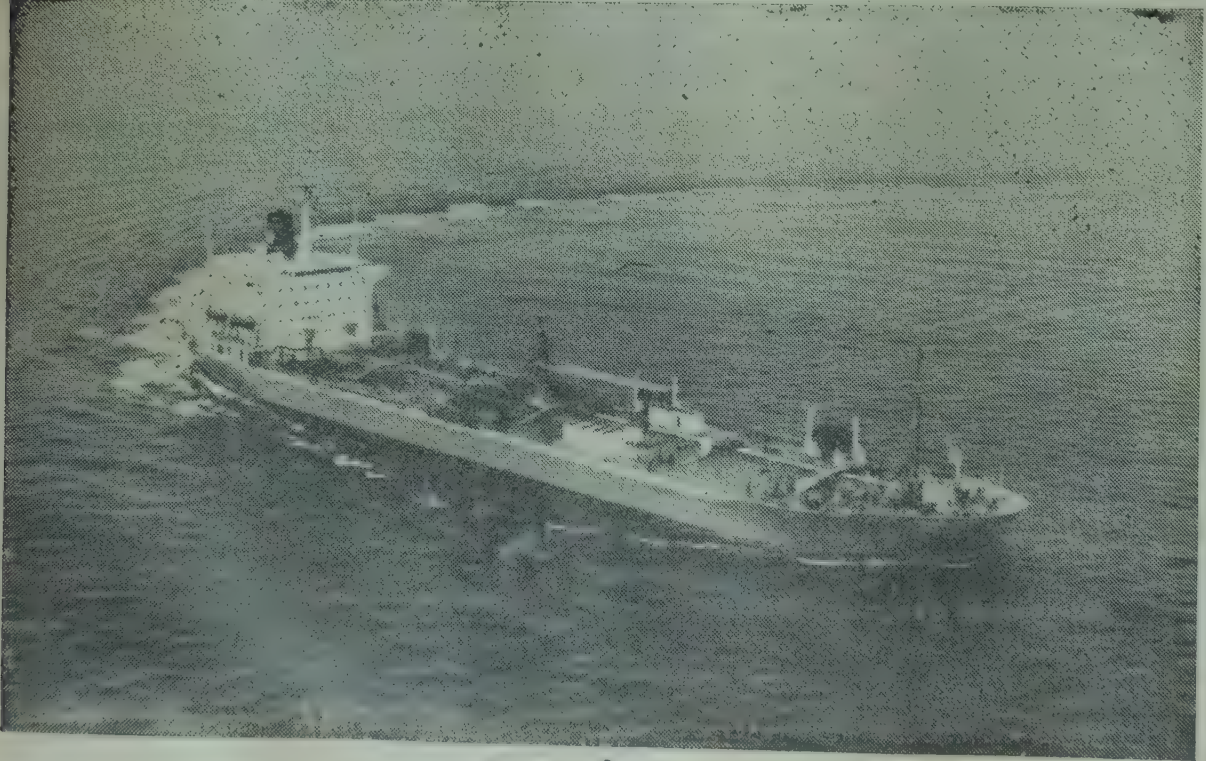
SCI had realised that the major growth areas for India's exports would be Africa and South-East Asia in future. Therefore, it had started a container service to some West African countries like Nigeria, Ghana, Republic of Benin, Republic of Senegal and the Ivory Coast in December 1980. The SCI also started operating a regular container service to Mauritius and East African countries from August 1981.

In keeping with requirements the SCI today handled a large number of containers — 5522 (TEUs) containers per day against 1085 (TEUs) containers in 1979. To suit national requirements it had also acquired 21 bulk carriers ranging in size from 18,000 dwt to 1,29,000 dwt in a short period. To serve India's oil industry, SCI had acquired a fleet of 24 tankers totalling 1.81 million dwt. SCI tankers today maintain an uninterrupted supply of crude oil to various Indian refineries and also ensure regular movement of petroleum products along the coast.

Indian shipping also entered the era of VLCC operations with the berthing of SCI's very large crude carrier, *Kanchenjunga* at the single buoy mooring at Vadinar off Jamnagar coast in March 1981, for discharging 2,25,000 tonnes of crude oil for the Koyali and Mathura refineries. Because of the growing complex nature of India's trade, SCI had acquired a few combination carriers ranging from 22,000 dwt to 1,23,000 dwt.

Outlining SCI's support to indigenous shipbuilding, Vice Admiral Gandhi said, the SCI had ordered and acquired 27 cargo liners from Hindustan Shipyard, Visakhapatnam, and two passenger ships from Mazagon Dock, Bombay. The SCI was also the first Indian shipping line to order a bulk carrier from Cochin shipyard. It acquired m.v. 'Rani Padmini' of 77,000 dwt in July 1981.

Referring to the SCI's profits, Vice Admiral Gandhi said, the SCI's net profits at the end of March 31, 1981 were Rs 17 crores. Only the company was loosing upward of Rs 50 lakhs every month at Bombay port due to congestion. He said, the SCI today had an investment of over Rs 1,043 crores. Since its inception it had helped save the national exchequer foreign exchange worth Rs 1330.5 crores.



Mt C. V. Raman, a medium type tanker of Shipping Corporation of India.

STANDARD ALKALI
THE SYMBOL OF DEPENDABILITY IN INDUSTRIAL CHEMICALS

STANDARD ALKALI

For over a decade, Standard Alkali's products have been known for their superior quality and competitive prices.

Our customer list includes just about every important name in the industry today.

Coming to think of it, Standard Alkali has become synonymous with dependability.

Products on tap from Standard Alkali—Hydrochloric Acid, Caustic Soda, Caustic Potash, Potassium Carbonate, Chlorine, Carbon Tetrachloride and Chloroform.

PRESSMAN

Doubly Deadly

Shelltox®

2-in-1 Household Insecticide

knocks down mosquitoes dead, and kills cockroaches, bed-bugs, ants.

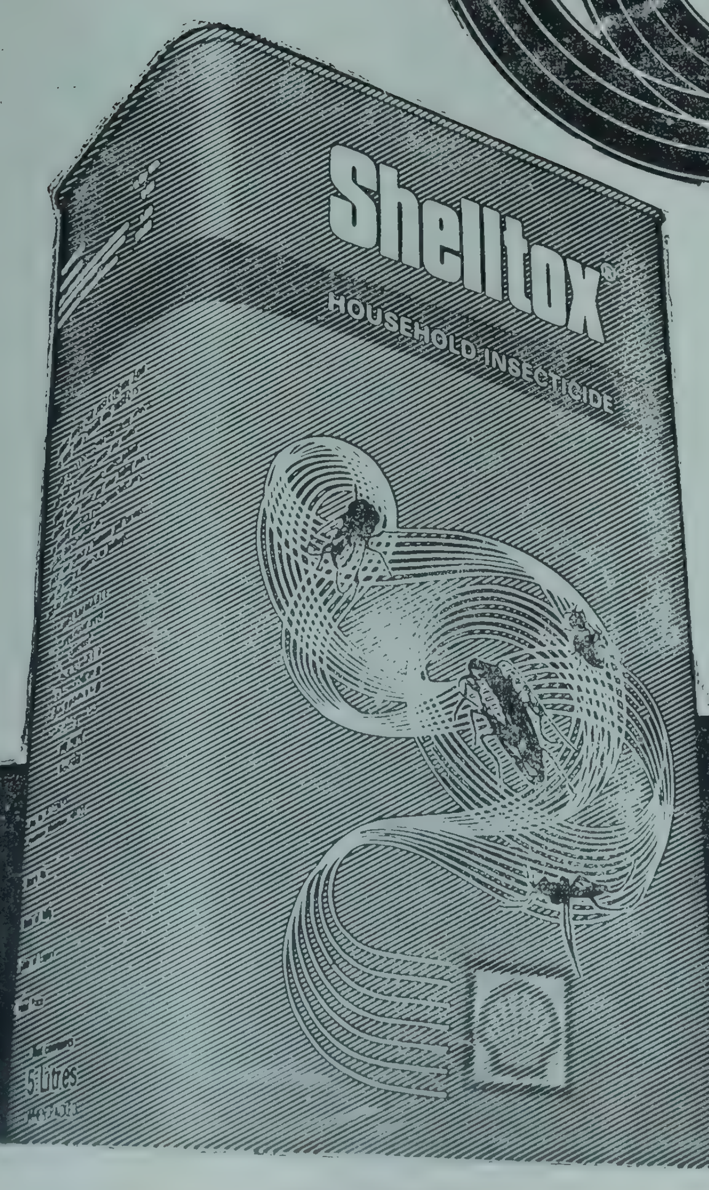
Shelltox—the most powerful 2-in-1 insecticide

Shelltox contains two powerful insecticides—one has a quick, knock-down-dead effect on flying mosquitoes and insects. The other has a longer-lasting, persistent effect that kills cockroaches, ants, fleas, bed-bugs, etc.

Shelltox comes ready-for-use

Shelltox is safer since you do not have to mix it before spraying. Just pour Shelltox into your sprayer. Close all doors and windows and start spraying. First into space, then behind furniture, curtains, beds—wherever cockroaches and insects hide in the house. Then leave the room and keep it closed for 15 to 20 minutes.

Shelltox is available in ½ litre, 1 litre and 5 litre tins from leading stores and chemists.



Shelltox®

the deadly insect killer

TISCO

Rising input costs

BOMBAY

THE Tata Iron and Steel Co is going in for a two phase expansion programme. The first phase will cost Rs 200 crores and the next phase an additional Rs 200 crores. For the first phase of expansion the company will raise Rs 100 crores from the Steel Development Fund and Rs 25 crores from financial institutions.

Presiding over the seventy-fourth annual general meeting of TISCO, the chairman, Mr J. R. D. Tata said the first phase of expansion would result in an increased capacity of 200,000 tonnes of liquid steel. Mr Tata had pleaded with the Government that the Steel Development Fund should be used only for modernisation and consequential expansion, and not for cost escalation he said. The Steel Development Fund was expected to grow by Rs 350 crores a year with the 14 per cent interest rate the Government charged its users. With the fund growing at that rate it would soon have much more than the steel plants needed for modernisation, Mr Tata has, therefore, pleaded with the Government to reduce the contribution requirement to the fund or to find some other way whereby the company did not have to put such a large amount into the fund. The contribution requirement which was Rs 600 per tonne amounted to Rs 90 crores for TISCO.

Reviewing the performance in the first four months of 1981-82, Mr Tata said production was 40,000 tonnes more than that during the same period of 1980-81. Receipts for the period were Rs 198 crores against Rs 133 crores. This period's performance was influenced by substantial changes that took place towards the end of the last working year. On February 9, the Government announced a 20 per cent increase in the prices of controlled items. The increase which worked out to Rs 400 to Rs 500 per tonne for controlled items applied to 1.1 million tonnes of production by TISCO. On February 24, the Government took a bold decision and announced decontrol of billets and bars, which in the case of TISCO account for 40 per cent of turnover. As things are, from that date, only about 29 to 30 per cent of TISCO's output *viz*, flat products, rails, structurals and tin bars comes under the price control. There has thus been a substantial increase in revenues from sales of 40 per cent of steel. But, while the company's

---

As I see it

Plight of a public sector unit

THE National Buildings Organisation (NBO) set up two plants — one for the production of dry hydrated lime (60 tonnes per day) and the other for clay pozzolona (reactive surkhi — capacity 20 tonnes per day) at Sultanpur, Delhi at a cost of Rs 16.73 lakhs. Although the plants were commissioned in March 1976, actual production could be undertaken only nine months later, in December 1976, on account of the delay in making arrangements for power supply by the Delhi Electric Supply Undertaking (DESU) and the delay in standardisation of parameters like limestone to coal ratio and time temperature effects. Right from the start the production of dust lime per tonne of limestone was lower than earlier estimated thus vitiating the cost estimates. As against an estimated cost of production of dry hydrated lime of Rs 127 per tonne the actual cost turned out to be Rs 759 per tonne during 1977-78. The actual cost of production (Rs 1,029 per tonne during 1977-78) of clay pozzolana deviated even more from the earlier estimated cost of production of Rs 80 per tonne. In the following year there was a reduction in the cost of production of both the items but the cost still fell short of the selling prices so that by the end of March 1979 there was a net loss of Rs 13.67 lakhs.

Before deciding on setting up the unit the potential annual demand for dry hydrated lime was assessed at about 20,000 tonnes and it was thought that NBO's production could be fully utilised by the three principal construction agencies in Delhi, *viz,* the Delhi Development Authority (DDA), the Central Public Works Department (CPWD) and Delhi Administration. However, in fact CPWD took only 15.28 tonnes and DDA took only 17.5 tonnes. The new product did not find favour because of its higher cost and some other problems. Moreover, the product was fit for use only for the construction of single storey or double storeyed building and was unsuitable for use in multi-storeyed buildings, to the construction of which the CPWD and DDA had since turned. The decision was taken to close down the plant from May 1980.

Apparently the dry hydrated lime and clay pozzolona produced by the plant of NBO were of better quality than those available in the market, according to the results of comprehensive testing undertaken at the Central Buildings Research Institute. The demonstrations organised by NBO had impressed the state-level functionaries so much that the NBO was called upon to instal two captive plants in Madhya Pradesh and one in Srinagar (Jammu & Kashmir). At the instance of Karnataka Housing Board NBO prepared a feasibility report for setting up three similar dry hydrated lime plants in Karnataka. Similarly NBO was reportedly preparing another feasibility report for setting up a plant of a similar nature in Himachal Pradesh. Notwithstanding all this, the NBO's initiative to persuade the Government of Haryana to run the NBO's own plants as managing agent bore no fruit and the Directorate-General of Supplies and Disposals also failed to find a purchaser for the unit so that efforts were being made to persuade the CPWD to take over the NBO plant, which has been disfavoured by the Public Accounts Committee.

The Public Accounts Committee (1980-81) of the Seventh Lok Sabha in its fortysecond report has, not unexpectedly, deplored the entire exercise as an example, which indicated "how wrong planning can bring bad name to the Government and also the governmental agencies which are entrusted with the work of executing such schemes". The Committee has called upon the Government "to undertake an enquiry into the whole case, right from the proposal stage to the closure of the plant so as to fix responsibility on the officials who were directly or indirectly responsible for the various deficiencies..."

Subhash Chandra Sarker

Money

Diversionary tactics

THE suggested bifurcation of the Life Insurance Corporation into regional corporations has been the starting point of a fresh round of discussions on reorganisation of the banking structure. How many banks? How many of them at national and regional levels? Should they compete with each other or be complementary? Should we have a few all-India giants with a vast network like the State Bank of India or should we opt for small local banks in the districts and blocks and villages ?

All these issues are really besides the point. And their major disadvantage is that they help to cover up the really significant and vital issues in banking that require immediate and sustained attention—how to bring about simplicity and economy in banking operations ? In all areas, even the simplest ones, procedures and practices have become so complicated and cumbersome that they defeat their own purpose. Some banks have introduced mechanised accounting at their major branches and some others are battling with their unions for doing so. These mechanised systems have not solved the main problem of giving statements to customers, but created many more and much more complicated problems of the mechanised system itself. Thus, a system that was specifically created to solve the problems of writing ledgers and giving statements has, far from solving those problems created many more problems in the system itself.

In the meanwhile at thousands of branches throughout the country, three simple problems of elementary banking are shelved. No one cares about giving a customer a statement of his account or pass-book just when he needs or asks. Similarly, despite their financial ingenuity, bankers are unable to collect local clearing cheques within 24 hours or outstation collection of bills and cheques within eight or ten days. Even the bankers themselves agree that these three tasks of passbooks, clearing and collection require very elementary banking or administrative skills.

The trouble with reorganisation and diversification movement is that it will create its own problems of adjustment and merger—they will be so vast that bankers will have another excuse for at least five years not to deal with the simple and elementary problems of good customer service.

There is an even more elementary problem of cash. Banks handle more cash than they have storage or handling capacity. They receive more cash than they pay, just as many branches have more staff than chairs. Even the Reserve Bank has similar cash problems. They print more notes in a year than they can destroy in a week or a month. The result is that allround there is more cash than the banking system can handle, store or destroy.

Bankers themeselves add new dimensions to this 'impossible' problem. Their clearing and collection and practices and delays force their customers to draw cash from one bank and immediately pay it into another bank for retiring hundis. Delays in issuing drafts and pay orders lead to further handling of cash. Clearing timings also lead to cash movements from account to account, area to area, even city to city to finance kite flying by customers. Yet bankers are unaware of what is going on.

Apart from increasing their efficiency and quality of service in these areas, there is only one solution to this cash problem—to have currency chest mechanism at every one of the 5,000 block level headquarters in the country. This is one of the finest, most efficient and economical mechanisms for handling remittances of cash in a vast country like India, that the government had invented 200 years ago. It still has the same potential. But during the last five years, the RBI had planned for 500 currency chests only and bankers could open less than 300. Bankers are lost incalculating costs of building and running a chest, not realising that saving in interest costs alone will more than finance these capital and revenue costs.

S. G. Shah

profits would increase substantially, this year, input costs would also go up, they went up by Rs 256 per tonne last year. Mr Tata expected sales to rise to Rs 700 crores during the current year as against Rs 521 crores in 1980-81.

Mr Tata announced that Indian Tube Company had become a subsidiary of TISCO. TISCO had agreed to buy British Steel Corporation's holding in Indian Tube Co. Pending the clearance of this by the Government, British Steel Corporation had agreed to allow TISCO to appoint directors to the company.

Mr Tata also announced that 14½ per cent interest would be paid alike on convertible bonds and preference shares, when the dividend exceeds 13½ per cent. In a vulnerable, controlled industry, TISCO should go increasingly towards specialisation and value added products, he said. TISCO also expected to get an industrial license soon for producing 90,000 tonnes of sponge iron a year in partnership with the Orissa Government.

The total turnover of the company at Rs 521 crores was higher than in the previous year by 14 per cent. The company's growing requirement for working capital is proposed to be met by raising long-term funds in the form of convertible bonds of Rs 30 crores. The proposed bond issue will be in the form of a rights-cum-public issue.

ENGINEERING EXPORTS

Uncertainties over?

BOMBAY

THE Engineering Export Promotion Council has held an impressive array of functions to celebrate its silver jubilee in New Delhi on August 17 and 18. The President, Mr Neelam Sanjiva Reddy, is inaugurated the silver jubilee function, while the Union Commerce Minister, Mr Pranab Kumar Mukherjee, inaugurated a seminar on export strategy in the '80s. The council has prepared an exhaustive paper on the subject with special emphasis on fifteen selected countries — USA, West Germany, France, Indonesia, Malaysia, Sri Lanka, Iran, Iraq, Saudi Arabia, Libya, Ivory Coast, Nigeria, Kenya, Tanzania and Zimbabwe. These countries would account for nearly Rs 6,000 crores of engineering exports by the end of the decade.

Mr G. D. Shah, chairman, EEPC, said that the council had been set up at a time when there was a general inhibition born of 200 years of foreign domination that India would not be able to export engineering goods in the face of competition from highly industrialised countries. Nevertheless, engineering exports rose from a mere Rs 5 crores in 1955-56 to Rs 900 crores in 1980-81. Exports consisted of simple steel based items in 1955. Today, capital goods account for 38 per cent of exports. Exports to neighbouring countries in Asia and Africa, which constituted 96 per cent of exports in 1956-57, have fallen to 70 per cent. About 28 per cent of our engineering exports today go to the developed countries of Europe and America.

Mr Shah said that EEPC had planned to reach the Rs 9,000 crore mark by 1990-91. A thrust would be given to capital goods exports and project exports which would together account for 50 per cent of exports, *i.e.* Rs 4,500 crores, by then.

Despite Mr Shah's claims for the past two decades, the engineering industry has not been pushing up its exports as hoped for in the past few years. The industry's performance was lack-lustre in 1979-80 with only Rs 650 crores of exports against Rs 717 crores in 1978-79. In 1980-81, there was a nominal recovery to Rs 900 crores. EEPC's target for the current financial year is Rs 1,150 crores. The attainment of this target is doubtful because of protectionist barriers raised in the US and EEC against Third World manufactures, shipping difficulties at Indian ports, and big power cuts in certain states. In fact, the industry lost contracts worth Rs 200 to Rs 250 crores in the last three months because of uncertainties in steel prices. Domestic steel prices were raised in February.

The air has now been cleared on this count. The Government has decided not only to accord full price protection to export contracts entered into before February 9, 1981, but also to supply steel to engineering export units at international prices. Domestic prices of steel are higher by Rs 2,000 per tonne compared to international prices. This will give the required price support to engineering export units.

The EEPC is now concentrating on another major promising area for engineering exports — subcontracting. The engineering giants of France and Belgium are keen on associating Indian industry in sub-contracting in West Asia. The council is, therefore, holding some major promotional programmes in the current financial year. They include a symposium in Belgium in September on Indo-Belgium trade and industrial co-operation, a follow-up conference for European contractors in India in Novem-

CORPORATE SECTOR

In the market

East India Hotels

The East India Hotels Ltd (Registered Office : 4 Mangoe Lane, Calcutta-700 001), is entering the capital market on August 31, 1981 with a unique public issue of secured convertible cumulative debentures of Rs 3 crores. Giving details of the scheme at a press conference, Mr M. S. Oberoi, chairman of the company said that the debentures will be convertible into equity shares to the extent of 20 per cent at the end of the third year from the date of allotment. Interest will be accumulated every year compounded on a half-yearly basis and will be payable from the end of the seventh year onwards. Investors will earn an effective rate of interest of 13.96 per cent per annum. An investor investing Rs 10,000 in these debentures could this earn Rs 30,000 at the end of seven years.

The return on investment by way of interest alone will average 23.55 per cent per annum on the life of the debentures on reducing balances. If a debenture holder decides to sell the equity shares acquired as a result of conversion on the basis of the present market prices of the shares and taking into consideration the appreciation in value, the aggregate return to the investor could be over 30 per cent.

Reviewing the performance of the East India Hotels Limited, Mr Oberoi said, for the year ended March 31, 1981, the company achieved a record profit of Rs 7.12 crores before tax. The company has had an excellent dividend record, the average dividend being over 22 per cent for the last three years. The company's hotels enjoyed high occupancies from 1976-77 to 1980-81. Sales increased from Rs 17.65 crores to Rs 32.77 crores.

The proceeds of the debenture issue will be used to strengthen the capital base of the company. It will be mainly utilised to finance expansion of Hotel Oberoi Towers at Bombay by 192 rooms to meet the increasing demand for hotel rooms. The construction work has already been completed and the entire expansion will be completed by October 1981.

The company has also on anvil implementation of new hotel projects in Jaipur, Bhubhaneshwar, Bangalore, Hyderabad, Agra, Cochin and Goa.

Other developments

Dhrangadhra Chemical Works: Turnover up

Turnover of Dhrangadhra Chemical Works Ltd for the year ended March 1981 increased to Rs 35.43 crores from Rs 26.25 crores in the previous year. The net profit, after providing Rs 88.95 lakhs (Rs 74.74 lakhs) for depreciation and Rs 1.50 crores (Rs 30 lakhs) for taxation, amounted to Rs 1.13 crores (Rs 69.48 lakhs). The equity dividend recommended for the year under review is 15 per cent (12 per cent). An amount of Rs 10.43 lakhs (Rs 32.52 lakhs) is tansferred to investment allowance reserve and Rs 50 lakhs (Rs 2 lakhs) to general reserve. Production of soda ash during the year under review was 61,001 tonnes (49,743 tonnes).

Mafatlal Engineering: All-round improvement

Mafatlal Engineering Industries Ltd will spend Rs 45 crores to Rs 50 crores on modernisation over the next four to five years and has got a licence to make shuttleless looms. Announcing this at the company's 33rd annual general meeting, chairman, Mr Arvind Mafatlal, said there was an all-round improvement in production and turnover in the year 1980-81. Production of ring frames, draw frames, fly frames and high production cards reached an all time record. At the end of March 1981, the value of outstanding orders was Rs 160 crores. The in-flow of orders continued to be satisfactory and a further increase in production was planned for 1981-82.

Export orders worth Rs 162.76 lakhs were booked during the year. In addition, the company earned foreign exchange worth US $1,22,500 by way of fees for rendering technical and management services to a textile process house in Sudan.

Mr Mafatlal reported that the greatest disturbing factor during the year was the unprecedented rise in prices which neutralised gains in profitability. Personnel costs also increased substantially as a result of spiralling increase in the cost of living index. The company also entered into a wage settlement with the recognised union at Kalwe in January 1981. The new settlement became effective from September 1, 1979, resulting in a substantial amount payable by way of arrears of wages.

Mr Mafatlal said, the company had completed the first phase of modernisation and replacement programme and had fully utilised loans aggregating Rs 200 lakhs from IDBI, IFCI and ICICI under the soft loan scheme. The second phase of modernisation and the replacement programme involving a capital expenditure of Rs 900 lakhs had been worked out. ICICI, IDBI and IFCI had sanctioned loans to the extent of Rs 620 lakhs. The balance amount of Rs 280 lakhs would be financed from the company's own sources. The company had already availed of Rs 241.86 lakhs out of the sanctioned loans of Rs 620 lakhs.

Estrela Batteries: Trying to revive

Estrela Batteries Ltd, which has been facing severe financial and labour problems and is almost a sick unit, expects to improve its performance now that its new management has reached a long-term productivity agreement with its workers' union. The company manufactures dry cells for various applications and has been in the field for 40 years.

Modi Alkalies: Progress report

Modi Alkalies and Chemicals Ltd, a Modi group company, has made some headway on implementation of its project at Alwar (Rajasthan) for the manufacture of 37,060 tonnes per annum of caustic soda, 19,800 tonnes per annum of hydrochloric acid, 20,460 tonnes per annum of liquid chlorine and 10,000 tonnes per annum of stable bleaching powder. Mr Y. K. Modi, vice-chairman and managing director of the company, told newsmen in Bombay that orders for machinery worth about Rs 8 crores had already been placed out of total equipment requirement of Rs 18 crores and balance orders would be finalised in the next few months. Erection of the plant and machinery was scheduled to be completed by January 1983 and commercial production could start in the following March.

The plant will be using the West German mercury cell process which assures big savings in energy and also lower loss of mercury. The plant would also incorporate facility for switching over from graphite anodes to dimensionally stable anodes with a view to further improving its capacity and reducing power consumption Mr Modi expected production cost at the plant to be lower by Rs 300 to 400 per tonne compared to other plants making similar products.

The project was expected to cost Rs 26.70 crores and to partly finance the scheme the company intended to come out some time in December this year with a public issue of Rs 3.41 crores out of the total equity capital of Rs 8.75 crores. The balance of the project cost was to be met from term loans of Rs 17.80 crores from financial institutions and banks, and central subsidy of Rs 15 lakhs.

Cooptex: Ambitious sales target

The Tamil Nadu Handloom Weavers' Cooperative Society (Cooptex) has fixed a revised sales target of Rs 75 crores (as against original target of Rs 45 crores) for 1981-82 and has planned to achieve this ambitious target through various measures regionwise, productwise and channelwise. According to Tamil Nadu Minister for Handlooms, Mr Rajendran, Cooptex has planned to increase the production of janata varieties to 40 million square metres to meet the varietal needs from all over the country. Cooptex will concentrate on production of varieties suited to metropolitan markets of Bombay, New Delhi and Calcutta and also exploit the potential markets like Gujarat. Cooptex hopes to contact the handloom development corporations of various States including Gujarat, UP, Orissa and Bihar for distribution of Janata varieties through their marketing outlets.

Besides designing new designs Cooptex has collected national designs as part of its marketing strategy. Sarees included in the collection have been designed and printed to cater to needs of higher income groups. Cooptex also plans to purchase varieties produced in other States and market them through Cooptex showrooms. The export target for 1981-82 is Rs 4 crores.

Indian Cable: Sales up

The Indian Cable Company Limited (INCAB) achieved sales of Rs 53.61 crores during the year ended March 31, 1981 against Rs 47.27 crores in the previous year representing an increase of 13 per cent. Crippling power shortage at Jamshedpur and financial stringency aggravated operational problems. Profit after tax for the year was Rs 1.62 crores (Rs 1.17 crores) while, depreciation absorbed Rs 67 lakhs (Rs 68 lakhs). Transfer to investment allowance reserve absorbed Rs 4 lakhs. The board of directors recommended a dividend of 17 per cent amounting to Rs 1.07 crores as against 14 per cent last year. The company's new project at its Pune works to manufacture 800 km of PVC power cable per annum is nearing completion and is expected to start commercial production during the current financial year.

Machinery Manufacturers Corporation: Sales, profits up

Sales of Machinery Manufacturers Corporation Limited for the year ended March 1981 increased to Rs 25.60 crores from Rs 16.21 crores in the previous year. The net profit, after providing Rs 62.73 lakhs (Rs 38.92 lakhs) for depreciation, Rs 1.24 crores (Rs 1.25 crores) for interest payments and Rs 11 lakhs (Rs 11.25 lakhs) for taxation, amounted to Rs 93.38 lakhs (Rs 34.38 lakhs). The equity dividend recommended for the year under review is 12.5 per cent. An amount of Rs 23.94 lakhs (Rs 15.72 lakhs) is transferred to investment allowances reserve and Rs 50 lakhs (nil) to general reserve. Orders in hand as on March 31, 1981 were Rs 89.26 crores. In the company's Calcutta factory, an amount of Rs 1.40 crores has been spent on the modernisation of the plant and equipment.

Colour-Chem pays 15 per cent

Sales of Colour-Chem Ltd for the year ended March 1981 increased to Rs 50.07 crores from Rs 44.20 crores in the previous year. The net profit, after providing Rs 2.20 crores (Rs 2.16 crores) for depreciation and Rs 2.57 crores (Rs 2.20 crores) for taxation, was Rs 2.09 crores (Rs 2.12 crores). The equity dividend recommended for the year under review is 15 per cent (12 per cent). An amount of Rs 22 lakhs (Rs 51 lakhs) is transferred to investment allowance reserve and Rs 20 lakhs (Rs 76.73 lakhs) to general reserve.

Zenith Steel Pipes to diversify

Zenith Steel Pipes and Industries Ltd has reported higher sales for the year ended April 1981 at Rs 52.69 crores compared to Rs 39.93 crores in the previous year. The net profit, after providing Rs 58.23 lakhs (Rs 54.09 lakhs) for depreciation and Rs 90 lakhs (Rs 42 lakhs) for taxation, amounted to Rs 1.77 crores (Rs 1.44 crores). The equity dividend recommended for the year under review is 20 per cent. An amount of Rs 20.70 lakhs (Rs 68.07 lakhs) is transferred to investment allowance reserve and Rs 1.17 crores (Rs 32.41 lakhs) to general reserve. The total fob value of pipes exported during the year under review was Rs 10.55 crores. During the year under review, an industrial licence has been received for the manufacture of writing and printing paper up to 19,800 tonnes per annum. The plant is located at Bana Fateha a backward area in Hoshiarpur district of Punjab. A letter of intent for manufacture of portland cement up to five lakh tonnes per annum has been received by the company. A letter of registration from DGTD has been received for the manufacture of beta naphthol with an annual capacity of 1,000 tonnes.

EQUITIES

Steady undertone

Bombay, August 17

After resuming on a better note, pivotals reacted modestly on profit-taking and lack of follow-up support at the improved rates. A few scrips, however, staged a recovery towards the end of the week on short-covering and replacement support. With gains and losses matching almost equally, the final price levels were again mixed.

The cautious attitude of marketmen is understandable in view of the start of the monsoon session of Parliament on August 17 and the possibility of further steps to curb the inflationary trend in the economy. Besides BSE imposed special additional deposit margins on 25 scrips (17 in the case of bulls and 8 in respect of bears) to arrest both excessive buying and heavy selling.

Century after an initial setback at Rs 805 rallied smartly to Rs 841 on reports that the proposed lock-out at its Kalyan plant on August 13 had been deferred following the State Government's intervention in the labour dispute. With scattered profit-taking, however, the scrip closed at Rs 837.50 with a net gain of Rs 24. After limited activity, Standard closed at Rs 553, with a nominal increase of one point.

Tata Mills, which was subdued earlier on rumours of Tatas unloading their equity holdings in the company, ruled steady in later dealings following the company's denial of such selling. Tata Steel suffered a sharp setback on fears of sharp erosion in the profitability of the company during the current year ending March 1982. The price was marked down from Rs 380 to Rs 334 before closing at Rs 349 with a net loss of 31 points.

After the recent reaction, PAL rallied again by 13 points to Rs 242 on influential buying. TELCO recorded an impressive increase by Rs 33 to Rs 656.

In the cash section, Ultramarine jumped by Rs 35 to Rs 420 on recommendation of a bonus issue in the ratio of one-for-two. The closing was, however, at Rs 400 because of profit-taking, showing a net gain of 15 points. Century Enka spurted by Rs 35 to Rs 710, Baroda Rayon by Rs 9 to Rs 339, S.I. Viscose by Rs 15 to Rs 272.50 and Dempo Steamships by Rs 10 to Rs 590. Indian Rayon crossed the Rs 100 mark, standing at Rs 102 before closing unchanged at Rs 97.

Market Gossip

Costlier shipping loans?

THE Finance Ministry is reportedly toying with the idea of making the loans to the shipping industry from the Shipping Development Fund Committee (SDFC) costlier by 1½ to 2½ per cent. At present the SDFC charges an interest of 4½ per cent on these loans. The Finance Ministry is reportedly of the view that the loans are extra cheap and that there is no reason why such assistance should be made available to the shipping companies at rates at concessional rates than those that are given under the soft loan scheme for other industries. As expected the move has met with stiff resistance from the Ministry of Transport and Shipping. It is recognised by the Shipping Ministry that a major factor which has helped the shipping tonnage to grow has been the loans from the SDFC. This Ministry has also reportedly pointed out that Indian shipping companies are obliged to place orders on Indian shipyards whenever they go in for expansion. The shipping lines have to pay a price higher by 10 per cent than the international price of the ship because the Indian ships are costlier. It would seem to be the Shipping Ministry's argument that if the shipping companies have to shoulder this extra burden they should also get loans at concessional interest for their shipping expansion plans.

The Ministry of Finance would already seem to have decided that non-shipping MRTP companies which branch out into shipping should not be entitled to the loans from the SDFC. It has ruled out a suggestion from the Shipping Ministry that such loans could be considered for the non-shipping companies when they form a separate shipping company.

These reports have caused quite a lot of worry in the shipping industry. What worries them still more is that some bureaucrats in the Government of India are thinking of reserving 60 per cent of the shipping tonnage for the public sector and only 40 per cent for the private sector. This would mean that in the 10 million grt target fixed for 1990 the public sector tonnage would about 6 million and the private sector 4 million. It is not known how such a division will operate in the Sixth Plan period. Private sector companies are known to have placed orders in the last few months for about 2½ million dwt with the ships to be delivered before the Sixth Plan ends in 1985. If there is any truth in these reports, most of the private sector companies will find that they cannot undertake any expansion in the coming years.

Impounded public deposits for cotton units?

THE textile industry has suggested a novel way out of the stringency of funds it is facing in modernising itself. It has suggested to the Government to release the impounded public deposits of 10 per cent to the mills so that they could go ahead with their modernisation programmes. Under the Companies (Acceptance of Deposit) Act of 1975, non-banking and non-financial companies are required to deposit in banks or invest in specified securities a minimum of 10 per cent of public deposits maturing during the year ending on March 31. Further, in terms of section 40A (B) of the Income-tax Act 1961, 15 per cent by way of expenditure on public deposits is not treated as allowable expenditure to companies for tax purposes.

The Indian Cotton Mills Federation sources estimated that Rs 80 crores to Rs 85 crores had been collected by mills as deposits. If the Government releases the impounded public deposits of 10 per cent, funds to the extent of Rs 8 crores to Rs 8.5 crores will be released to the industry. For some units the unfreezing of 10 per cent of deposits would be a big relief for meeting working capital needs as also funds for modernisation.

According to ICMF currently the mills are engaged in implementing modernisation plans already taken on hand. During the last three years the industry has indeed ploughed back internal resources of over Rs 200 crores. As the current surplus has thus been reinvested towards promoters' contribution in modernisation schemes, there has been a further depletion in the working capital.

It was also claimed that the low profit profile of the textile industry as compared to others has been a stumbling block in the cotton mills industry's efforts at mobilising alternative sources of finance such as fresh equity, debentures or even public deposits. The interest on ceiling of 15 per cent on public deposits is another deterrent for the textile industry in particular. On top of it 15 per cent of the interest amount paid is disallowed under Income-tax act. The ICMF wants the Union Finance Ministry to treat the entire expenditure incurred towards interest payment on public deposit as allowable expenditure for purposes of corporate taxation.

Speculative market

THAT Dalal Street is still in the grip of speculators was evident from the behaviour of Tata Steel shares immediately after the TISCO annual general meeting was held on August 11 and where Mr J. R. D. Tata made a statement from which the market did not draw adequate encouragement. There was nothing discouraging in his speech either. What he said was that the sales output during the current year may touch Rs 700 crores, but that the profit margins were under pressure on account of rising costs. He also indicated that market demand for domestic steel was not as strong as it was so far because of large imports made. It maybe that the Government will take a hint from Mr Tata's speech and try to curtail imports as much as possible. But the speculators in the share market got busy immediately. Nervous liquidation followed and the price fell sharply from Rs 380 to Rs 325 before recovering to Rs 349. The drop in the Tata Steel shares also influenced the general market and the prices recorded a widespread retreat.

Cotton prices firm up

Bombay, August 17

Cotton prices have started to firm up despite reports of favourable progress of the monsoon and the announcement about the import of Pakistan cotton. Meanwhile, the Government of Maharashtra has issued an ordinance amending some of the provisions of the Maharashtra Raw Cotton (Procurement, Processing and Marketing) Act, 1971 and extending its duration by one year from June 30, 1981 to June 30, 1982. The amendment has been made to provide for better administration and for removing certain defects therefrom and making valuable improvements therein, which had been found necessary or had been recommended by the two committees appointed by the State Government and by the Reserve Bank of India.

A significant amendment to the Act provides that at the commencement of every cotton season, the Cotton Co-ordination Committee, appointed by the Government, will recommend to the State Government the guaranteed prices for different varieties or grades of cotton and where necessary, also of ginned cotton. On the recommendation of this committee, the State Government will notify the guaranteed prices for different varieties or grades of cotton and also ginned cotton.

The Act also provides for fixation of final price of cotton procured under the scheme, with reference to the position as on September 30 succeeding each cotton season. If the duration is for only one year, this stipulation reads a bit odd.

For margin money or equity base for generation of additional requirement of funds for the proper and continuous operation of the scheme—for one year, one presumes—it is proposed to establish a separate account to be called the capital formation fund. Each of the cotton growers as well as the agent appointed by the Government has to make a small contribution to the fund. The State Government will contribute to the fund not less than Rs 25 crores, on or before March 31, 1985, including any contribution already made by it for the purpose of the fund. Here again, it is not understood why a reference to 1985 is mentioned when the scheme has been extended only for the ensuing cotton season ending August 1982. There is no representative of the private textile industry in the co-ordination committee either.

Following the announcement of the procedure for import of Pakistan cotton, there have been doubts among industry circles whether there would be any enthusiasm among the mills to book any sizable cotton from Karachi.

The following has been the trend of prices of some of the leading varieties :

(Rs. per candy)

	August 7	August 14
Digvijay	5,100-5,200	5,050-5,100
Kalyan	4,800-4,900	4,700-4,800
Saurashtra CO2	4,900-5,150	4,800-5,050
Shankar 4	5,850-6,250	5,800-6,200
Maharashtra H 4	5,455-5,600	5,400-5,550
Maharashtra Varalaxmi	5,325-5,425	5,325-5,425

Downtrend in yarn

Bombay, August 17

A downward trend was noticed in the local yarn market except in the case of 150D acetate during the past week. The prices of 150D NRC, 120D NRC, 150D CR and 120D CR decreased by 28 paise to Rs 52.03, 57 paise to Rs 54.23, 55 paise to Rs 51.76 and 55 paise to Rs 54.52 respectively, while the price of 150D acetate increased by 55 paise to Rs 49.01. However, the price of 100D SIV remained unchanged at Rs 55.07.

Jute goods suffer setback

Calcutta, August 10

Jute goods suffered a setback in the Calcutta gunny market during the past week after initially ruling steady. The reaction reflected disappointment over the delay in the decision on the industry's request for a subsidy on jute goods exports to help it push up exports against stiff competition offered by synthetics and products of other countries.

The jute trade and industry is concerned over the fact that despite the depressed prices currently ruling in the market, inquiries for jute goods are limited as is evident from the latest statistics published by the Indian Jute Mills Association on despatches during the month of June. Total despatches have dropped to 85,900 tonnes in June from 95,800 tonnes in May. Export despatches are lower at 30,900 tonnes compared to 35,300 tonnes while those for domestic purchases have fallen from 62,500 tonnes to 55,000 tonnes. The situation has aggravated because the recovery of carpet backing in the overseas market has received a setback. Export despatches of this construction are smaller at 6,500 tonnes against 7,500 tonnes. The total decline in despatches of sacking has been the highest presumably because of the bigger output of this construction following the transter of some looms to this item from carpet backing.

The report of a fresh Russian contract for about 21,000 tonnes of hessian and sacking has had no impact on the market. The order comprises 15,000 tonnes of hessian and 6,000 tonnes of sacking for delivery during August-September. With this order, the Soviet Union will be buying nearly 95,000 tonnes since the beginning of this year against 150,000 tonnes provided for in the trade protocol between the two countries. The gratifying factor is that the Soviet authorities have agreed to pay 100 per cent of the invoice value instead of hitherto practice of paying 97 per cent of the invoice value keeping 3 per cent for adjustments against claims.

In order to beat competition from synthetics and inspire confidence in the inherent qualities of jute, the United Nations Development Programme has launched a special 500,000 project to educate the end-users in north America, Western Europe and Australia. In a recent report, the FAO takes an optimistic view of the outlook for jute. Such an optimism emanates from the rising costs of synthetic raw materials. The consumers should be impressed with the greater resilience of jute. The strength of the fibre is greater than that of synthetic products.

The fibre market was steady throughout the week in moderate trading reflecting fresh mill buying. The price of jute was maintained at Rs 231.00 per quintal for the W-5 grade. The inflow into the market was fair, this being the peak arrival season.

Groundnut oil flares up

Bombay, August 17

Groundnut oil price sky rocketed to a historic level of Rs 164.84 per 10 kg on August 13

Engineering exports: Uncertainties over?

Concluded from page 359

ber and a third conference on sub-contracting and participation in third country projects with Japanese firms, in India in February 1982.

The EEPC which began with a membership of 30 in 1955 is expanding rapidly. Apart from its head office in Calcutta, it has four regional offices in India and a territorial office in New Delhi. It has 10 foreign offices and expects to double them by the end of the decade. This will not in itself promote exports, unless the offices are backed up by dependable market surveys and follow-up efforts in the region.

A major constraint to exports at present, according to the EEPC is the limitation on existing capacity of several engineering industries producing hand tools, cutting tools, bicycles and parts, automobiles, diesel engines, pumps, electric fans, machine tools and electric power machinery like motors, transformers, generators, electronic components and storage batteries. Existing units in these areas should be allowed to expand. In addition, many large engineering units need to be brought into the mainstream of exports. A recent survey of the top 31 engineering units has revealed that they export a mere 0.08 per cent of their turnover. They could be induced to contribute 10 per cent of their output to exports. Similarly, the production base of small units, which contribute about 30 per cent to the total of engineering exports, could be expanded.

THE AHMEDABAD ELECTRICITY COMPANY, LIMITED

Registered Office:
Jubilee House, Opp. Old Power House,
Shahpur,
AHMEDABAD-380 001
GUJARAT STATE

NOTICE

It is hereby notified for the information of the public that THE AHMEDABAD ELECTRICITY COMPANY, LIMITED proposes to give to the Central Government in the Department of Company Affairs, New Delhi, a notice under sub-Section (1) of Section 21 of the Monopolies and Restrictive Trade Practices Act, 1969, for substantial expansion of its activities. Brief particulars of the proposal are as under :

(i) Names of body corporate owning the undertaking : THE AHMEDABAD ELECTRICITY COMPANY, LIMITED

(ii) Capital Structure of the applicant undertaking :

(a) **Authorised Capital :**

		Rs.
15,00,000	Equity Shares of Rs. 100 each	15,00,00,000
5,00,000	Cumulative Convertible Redeemable Preference Shares of Rs. 100 each	5,00,00,000
		20,00,00,000

(b) **Subscribed and Paid-up Capital :**

8,74,771	Equity Shares of Rs. 100/- each fully paid up	8,74,77,100
2,00,000	11% Cumulative Convertible Redeemable Preference Shares of Rs. 100/- each	2,00,00,000
		10,74,77,100

(iii) **Details of the proposed substantial expansion :**

(a) Name of New goods to be produced, supplied, controlled or distributed or of new services to be rendered : No new goods are proposed to be produced etc. nor any new services is to be rendered.

(b) In case of substantial expansion of existing activities :

(i) Nam of the Goods : Generation, Transmission and Distribution of Electricity in the licenced areas of Ahmedabad and Gandhinagar in Gujarat.

(ii) Capacity before expansion : Installed capacity is 327.5 MW which because of ageing of some of the plants is derated to 270 MW.

(iii) Expansion proposed : It is proposed to instal one more unit of 110 MW generating capacity. This unit is being installed by way of replacement cum rationalisation.

(iv) Location of the Project for substantial expansion : The project would be sited at Sabarmati, Ahmedabad on the land located within the Company's existing Sabarmati Power Station.

(v) Brief outline of the cost of the project, the Scheme and source of Finance : The cost of the Project is estimated to be approximately Rs. 62 crores and the proposed sources of financing the project will be as follows :

Sources	**Rs. in crores**
Secured Term Loans from Financial Institutions	23
Secured Term Loans from Commercial Banks	10
Secured Term Loan from Government of Gujarat	20
Issue of Share Capital	6
Deposits from Consumers	3
	62

2. Any person interested in the matter may make a representation to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this Notice, intimating his views on the proposal and indicating the nature of his interest therein.

Dated 19th day of August 1981

Sd/- J. J. RANA
Secretary

Notice

THE GWALIOR RAYON SILK MFG. (WVG.) CO. LIMITED

Regd. Office :
BIRLAGRAM, NAGDA
(M.P.)

NOTICE

NOTICE is hereby given that the Thirtyfourth Annual General Meeting of the Shareholders of the Company will be held at GRASIM CLUB, Birlagram, Nagda on Saturday the 19th September, 1981 at 4.15 P.M. (S.T.) to transact the Business mentioned in the Notice dated the 14th August, 1981 accompanying the Annual Report and Accounts for the year ended 31st March, 1981, separately posted to the Shareholders of the Company individually at their Registered Addresses.

The explanatory statement as required under Section 173 of the Companies Act, 1956, is annexed to the Notice.

NOTE :

(a) A MEMBER ENTITLED TO ATTEND AND VOTE IS ENTITLED TO APPOINT PROXY TO ATTEND AND VOTE INSTEAD OF HIMSELF AND THE PROXY NEED NOT BE A MEMBER.

(b) THE INSTRUMENT APPOINTING PROXY SHOULD, HOWEVER, BE DEPOSITED AT THE REGISTERED OFFICE OF THE COMPANY NOT LESS THAN FORTYEIGHT HOURS BEFORE THE COMMENCEMENT OF THE MEETING.

Shareholders are requested to intimate to the Company change in their registered addresses, if any.

By Order of the Board
D. N. MAKHARIA
Secretary

20th August, 1981.

in the oilseeds market from the previous week's Rs 160.16. The closing was only a shade lower at Rs 164.32. The continued firmness was attributed to limited supplies and strong advices from Gujarat. Besides, stockists were withholding their stocks on anticipation of further rise in view of the impending festival season. Karad bold, Saurashtra bold and Saurashtra quality moved up further by Rs 4 each to Rs 646, Rs 651 and Rs 656 per 100 kg.

Most of the imported oils also improved on limited fresh supplies. Palmoleine hardened by Rs 2.09 to Rs 149.76 and RBD by Rs 1.52 to Rs 135.20 per 10 kg. Soyabean was, however, a shade lower at Rs 146.12 against Rs 146.64 per 10 kg in the previous week.

Castorseed and its oils were better because of the firmness in groundnut oil. Madras small and Kanpur bold gained Rs 3 each at Rs 329 and Rs 321 per 100 kg. Commercial oil moved up by Rs 1.50 to Rs 71.50 and BSS oil by a rupee to Rs 76.50 per 10 kg.

Linseed and its oil ruled steady-to-better in limited business. Linseed bold was up by Rs 2 at Rs 542 per 100 kg and its oil by Rs 2.08 at Rs 135.20 per 10 kg.

Among cakes, groundut expeller and cottonseed rose by Rs 25 each to Rs 2,075 and Rs 1,600 per tonne. Castor hardened by Rs 20 to Rs 780 per tonne, while de-oil ruled steady at Rs 1,575.

Comparative prices in rupees per quintal of seeds and per 10 kg of oils :—

	14-8-1981	8-8-1981
G. nut Karad bold	646.00	642.00
G. nut oil	164.32	160.16
Cast. Md. Sm.	329.00	326.00
Cast. oil com.	71.50	70.00
Cast. oil BSS	76.50	75.50
Linseed bold	542.00	540.00
Linseed oil	135.20	133.12

Grains divergent

Bombay, August 17

Foodgrains displayed a divergent tendency during the past week.

Among cereals, wheat ruled steady. The Saurashtra variety of wheat was traded at Rs 220-235 per quintal and the superior variety at Rs 280-325 per quintal. Demand was slack. The inflow averaged 800 bags per day.

Demand was good for south Indian varieties of rice. Supplies were limited. Bulk buyers were active. Surti Kolam variety of rice spurted by Rs 10 to Rs 350-410 per quintal. Exporters were keen on lifting the south Indian varieties. Basmati variety ruled steady at Rs 450-600 per quintal on poor demand. Export demand for basmati was limited. Arrivals were satisfactory.

In coarse grains, because of an acute shortage of supplies, bajra rose by Rs 15 to Rs 185-260 per quintal. Advices from producing centres were firm. Supplies were limited. Jowar and maize maintained previous price levels. Demand was slack. The inflow was limited. Jowar fetched Rs 190-225 per quintal. Maize was quoted at Rs 130-135 per quintal.

Barring gram, pulses ruled steady. The price of gram dropped by Rs 5 to Rs 415-425 per quintal on withdrawal of buying support by the consumers. Supplies were moderate. Moong (chumki) was sold at Rs 450 per quintal. Masoor dal persisted at Rs 515-520 per quintal. Urad (Khandesh) was placed at Rs 310-315 per quintal. Tur dal maintained the previous week's level of Rs 495-590 per quintal. Local demand was limited. Advices from producing centres were encouraging.

Sugar recedes

Bombay, August 17

Sugar suffered a setback in the local market during the past week. The C-30 grade of sugar slipped by Rs 9 to Rs 640-652 per quintal. The fall was attributed to extremely poor demand for the commodity. The undertone was hesitant. Activity was moderate. Sellers were keen. The price of C-30 sugar as on August 14, 1981 was lower by Rs 121 per quintal than on the corresponding date a year ago.

The State sugar factories slashed their rates by Rs 20 to Rs 610-615 per quintal. The sugar stock with the dealers improved to 5,000 bags.

Khandsari ruled steady at Rs 500-580 per quintal.

Both gold and silver up

Bombay, August 17

Uptrend in both gold and silver marked the trading in the Bombay bullion market during the past week.

Standard mint gold opened at Rs 1,700 per 10 gm. and moved up to close firm at Rs 1,735 per 10 gm. Ready silver (.999 fineness) commenced at Rs 2,665 per kg and after dropping to Rs 2,645 per kg, it shot up to Rs 2,790 per kg before closing at Rs 2,760 per kg.

Money comfortable

Bombay, August 17

Conditions were comfortable in the Bombay short-term money market during the past week.

Interest rates opened at 10 per cent and fluctuated between 8 per cent and 10 per cent till Thursday (August 13). The rates, however, declined to close at 6 per cent.

Aggregate deposits decline

Bombay, August 17

Aggregate deposits of scheduled commercial banks declined by Rs 55.84 crores to Rs 40,556.34 crores during the week ended August 7, 1981. Bank credit expanded by Rs 64.41 crores to Rs 26,843.41 crores. The balances of banks with the Reserve Bank of India (RBI) increased by Rs 180.41 crores to Rs 5,186.32 crores and their borrowings from the RBI by Rs 10.44 crores to Rs 556.87 crores.

Anti-social sugar cooperatives

Concluded from page 368

field and factory — and provision of other amenities to workers, not to speak of the many levies and taxes by governments — Centre and state — have all combined to raise the production cost of sugar to the factories and the price of sugar to the consumer.

Many would have been content to pay a price warranted by the production cost plus excise, sales tax, etc, plus also reasonable margin of profit, but, as we have a system of sugar rations, sugar prices in the free market have not only to make up for the producers' loss on levy sugar but also to satisfy a number of parties which constitute the entire sales structure today. The quantum of rationed sugar being low, the demand for free sugar is bound to be nearly, and here it is only the inexorable law of supply and demand that operates, with what results everyone knows, and not the genuine needs of the poor consumer!

For no fault of their own, joint stock sugar factories are now obliged to be in the queue for supplies of cane; they have no hand either in fixing cane or sugar prices, or in deciding the purpose for which cane is used. Thanks to the increased demand for cane on account of illicit distillation, on the one hand, and of the demands of *khandsari* sugar, on the other, gur prices also are ruling above, even higher than the high sugar prices in the free market at present If, as a result, more cane is diverted to these two sources, the overall availability of cane supplies to sugar factories is bound to suffer, further. That, again, takes up the cost of production in a factory, the full installed capacity of which is adversely affected in the process.

One would be an optimist, therefore, to expect that sugar prices to the consumer in India would ever become reasonably fair. The vested interests wanting to keep prices up are so many, not all of whom are amenable to control. Even the Government which wants to raise as much revenue as possible, is a vested interest, wittingly or unwittingly. It is high time that the consumer gave up the sedulously sustained belief that the advent of co-operatives and the absence of the traditional middlemen would mean a lower price for him. Instead of the one known middleman, there are today so many more that what is saved in the swings is lost in the roundabouts. Those who have long believed in the genuine co-operative spirit must now be rubbing their eyes in consternation! I often wonder whether, as between the middlemen of old and the co-operatives of today, the former were not relatively more considerate to the consumer.

Beyond headlines

Anti-social sugar cooperatives

By R. V. MURTHY

FAR from being "the noble gospel of co-operation" that the fathers of the co-operative movement in Maharashtra, like the late Prof D. R. Gadgil and the late Mr Vaikunthbhai Mehta, intended it to be, the co-operatives of today — more so the sugar co-operatives in the State — have brought disrepute to the entire co-operative movement. They seem to have totally forgotton why patriotic Indians chose to go the whole hog with the pioneers of the co-operative movement, namely the expectation that, with the advent of co-operatives and the resulting elimination of greedy middlemen, the consumer would be the gainer, requiring to pay much less for what he might buy than ever before, as the example of one commodity — sugar — emphasises. Sugar co-operatives have not only been responsible for the high sugar prices the consumer has to pay today, higher even than his counterparts in England and elsewhere, but are opposing imports of sugar by the Government with a view to bringing down sugar prices in the country, on the plea that the 1981-82 season's sugar production is likely to be 68 lakh tonnes !

Having watched the rise and progress of sugar co-operatives, especially in Maharashtra, over the years, I fully endorse the remark, therefore, that 'recent experience of the co-operative sugar factories has conclusively proved that co-operatives are as socially irresponsible as any form of economic organisation' in the widely read "Editor's Notebook" column of your esteemed journal (vide P-207 of *Commerce* dated August 1, 1981). Years ago, I recall, after a more or less similar experience, I wrote an article in *Eastern Economist* to which I gave the title "Co-operative Cruelty". How apposite that title was is clearly seen in retrospect now. Much water has flown down the Krishna since that article was written though, but nothing has transpired to make me think of revising the title, what with the maximum use of the political clout these co-operatives have been making to further their own selfish ends.

It is a pity that some joint stock sugar companies should have, in the past, joined sugar co-operatives to plead with the government for a wholly anti-consumer sugar policy. At least from their own experience of the behaviour of sugar co-operatives ever since Maharashtra took to these co-operatives, they ought to have realised that their fortunes have been made the playthings of these sugar co-operatives even more than the policies of the state government. If sugar prices in the country are as high as they are, today, the blame for it lies, in the main, with sugar co-operatives. In the name of helping these co-operatives with concessions on one score or other, the state governments concerned have imposed more and more burdens on the private sector sugar industry. After all, joint stock sugar companies who are answerable to their shareholders could not be expected to bear these new burdens beyond a point. And when they passed on the incidence of these burdens even partly on to the consumers, the consumers began protesting. How can the consumer be expected to know that it is the state's policy of pampering sugar co-operatives that has resulted in the present high prices of sugar? Let me cite some glaring instances of state policy.

First, there is the question of cane supplies. When the Maharashtra State Government allowed a co-operative sugar factory to function in a given area, it did not realise that notwithstanding all their good intentions, the authorities could not possibly prevent diversion of cane supplies from the joint stock companies to the new co-operative sugar factory. There is a good reason for this too. Cane growers forming a sugar co-operative society are not only assured of a dividend on their shareholding in their society but also a handsome price for their supplies of sugarcane to their factory, thanks to the state polcy of assuring an economic price to the grower. Now, to the extent that some of these cane growers, who were former suppliers of cane to joint stock sugar companies, switched over their cane supplies to their own co-operatives, the joint stock companies were deprived of their share of cane supplies. Also, the latter could not get cane from independent cane growers unless they paid a higher price than the sugar co-operatives, and the prices in the latter case were determined by the cane grower-members themselves who naturally saw to it that they got their pound of flesh.

It was to overcome disputes regarding cane supplies to joint stock and co-operative factories that the idea of zones was conceived so as to make it obligatory for canegrowers in a given zone to supply cane to the factory in that zone: whether joint stock or co-operative. In practice, however, this did not yield the desired results, partly because of lack of effective enforcement and partly because even errant co-operatives had the local party man to back them up and save them from punishment. It is not surprising, therefore, that a subsequent proposal to form zones for procurement of cane for various factories has not been taken seriously by most sugar factories. There would be full support to the proposal only in the event of there being a rational basis for the formation of these zones. However, one does not know as yet what the basis is to be.

Secondly, there was the Maharashtra Land Ceilings Act, followed later by the decision of the State Government to take over even the land belonging to joint stock farms (over and above the ceiling fixed) for its own State Farming Corporation. No one — not even joint stock sugar factories — would have minded this highhandedness, had the State Farming Corporation been able to maintain the quality of the cane grown and to ensure adequate cane supplies at a reasonable price to all sugar units. But, on neither of these counts has the State Farming Corporation acquitted itself commendably.

Thirdly, contrary to expectations, even after the coming up of the Maharashtra State Farming Corporation, prices of sugarcane have gone on rising. To add to this, there has been an anomaly too by way of the Maharashtra Governmen wanting to fix its own cane price, in the face of the advice of the Prime Minister to all state governments and the actua fixation of a specific price by the Union Government. Moreover, as against the old ex-factory price for supply by the grower, at his own cost, of cane at the factory gate, the ex-factory price today has also to provide for transportion and handling of the cane from the field to the factory.

A number of other factors too have contributed to the recent rise in sugar prices. Water charges, wages to labour —

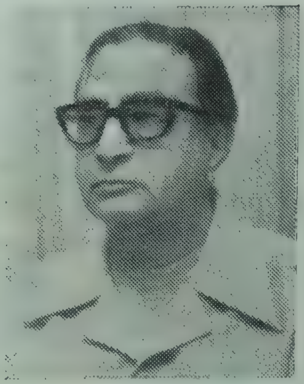
PEOPLE

Mr Ramesh Mukund Pradhan, who has been appointed executive director of Central Bank of India, has been with the bank since 1943 and worked in many important positions at several branches throughout India. Mr Pradhan, who is a B.Com and C.A.I.I.B., was actively associated with the committee of directors—Tandon Committee. He was promoted as general manager of the bank in November 1978 and this post he held till he moved over to his present assignment

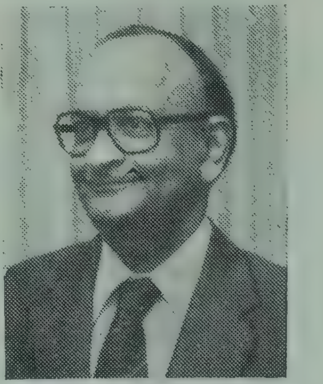


Pradhan

Shukla

Mr Dhansukh Nanalal Shukla, till recently general manager (operations) at the Bank of India, has been promoted executive director with effect from August 13 last. After his graduation from the Bombay University, Mr Shukla joined the Bank in 1949 and was sent to London for higher training in 1954. He was there for 14 years being placed in-charge of the bank's overseas establishments in East Africa. He returned to India in 1969 to take up more responsible assignments with the bank. Mr Shukla is a keen golfer too.

Mr P. B. Sreenivasan, 56, the newly appointed executive director of Indian Overseas Bank, was till recently its general manager. He joined the bank as a probationary officer in 1946 and since then worked in the bank's offices in India and Bangkok. He was regional manager at Bombay during 1967-71 and was promoted assistant general manager in 1971, as deputy general manager in 1975 and as general manager in 1978.

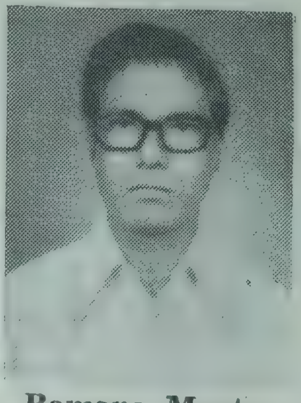


Sreenivasan

Rao

Mr H. N. Rao, executive director of Syndicate Bank with effect from August 13 last, came to it in 1946 after obtaining his B.Com. from Bombay. Mr Rao, who has also studied law and is a Fellow of the Indian Institute of Bankers, was till recently general manager of the bank and played a major role in its policy making and brought his influence to bear in areas like credit, investments, development, accounts, taxation and foreign business.

Mr B. V. Ramana Murty, general manager (finance) in Andhra Pradesh Industrial Infrastructure Corporation Ltd. has been elected chairman of the Andhra Pradesh chapter of the Institute of Cost and Works Accountants of India and Company Law Secretaries. A graduate in commerce, arts and law, Mr Murty has over 21 years experience in industry, banking and development corporations.



Ramana Murty

THE WEEK

None of the onshore and offshore blocks reserved for Oil India Ltd and Oil and Natural Gas Commission will be transferred to foreign companies for exploration, Union Petroleum Minister, Mr P. C. Sethi, categorically told the Lok Sabha. Meanwhile, Tripura project of ONGC was poised for a big breakthrough and gas was likely to be struck there, according to ONGC officials. ★

The Union Commerce Minister, Mr Pranab Mukherjee, has ruled out nationalisation of tea industry as a panacea for all its ills. He told the Lok Sabha that instead the Government would prefer to initiate measures to correct certain distortions that had crept into the industry's functioning. ★

The Integral Coach Factory has bagged a new export order valued at Rs 3.5 crores from Nigeria for supply of 30 brake vans. ★

There will be an overall power shortage of about 10.9 per cent or 15 billion units during the current fiscal year (1981-82) as against 12.7 per cent in 1980-81 and 16.1 per cent in 1979-80. The anticipated power generation in 1981-82 was 122 billion units as against requirements of 137 billion units, Mr Vikram Mahajan, Union Minister of State for Power, told the Rajya Sabha. ★

About 22 million mandays were lost during 1980 due to lockouts, while production loss amounted to Rs 124.53 crores as against Rs 125.63 crores in 1979, according to latest official estimates. ★

Procurement of new kapas under the Maharashtra Government's monopoly cotton procurement scheme has begun in western Maharashtra. The State Government's purchasing agency has paid an advance price of Rs 490 per quintal for Varalaxmi cotton as against the last season's guaranteed price of Rs 530. ★

The Union Government has reimposed export duty of Rs 75 per quintal on coffee with effect from August 21 last in view of the rising prices of this commodity in world markets. ★

The Union Government announced a higher quota for sale of sugar during September — 271,000 tonnes for levy and 200,000 tonnes for free sale. This brought down the retail prices to Rs 5.60 per kg. Alarmed at the downtrend, Bombay Sugar Merchants Association, in an unprecedented move, arbitrarily fixed floor prices of Rs 520 to Rs 550 per quintal. Its move has come in for widespread criticism. ★

Wholesale price index

At 287.2 the latest official wholesale price index for the week ended August 8, 1981 showed a rise of 0.2 per cent over the preceding week and 10.3 per cent over the year.

Money stringent

Conditions were comfortable in the Bombay short-term money market as of Monday (August 25). Both notified and commercial funds were renewed at 9 per cent while fresh money was transacted at 8.5 per cent.

COMMERCE

Oil : New ambitious target

IT is a measure of our concern to reduce the dependence on imported oil that programmes announced in the Sixth Five Year Plan document, published only last year, have been recast to aim at a higher target of production of indigenous oil. The Sixth Plan estimated that the production would rise to only 21.6 million tonnes by 1984-85, 13.2 million tonnes of it coming from offshore fields and 8.4 million tonnes from the onshore fields of both the Oil and Natural Gas Commission and Oil India Limited. This target has now been raised and the Minister for Petroleum, Mr P. C. Sethi, has announced that the offshore production would be increased to at least 20 million tonnes and the onshore production to 10 million tonnes making a total of 30 million tonnes by 1984-85.

Mr Sethi has also expressed the hope that consumption of petroleum products in the country would rise from 31 million tonnes in 1980-81 to only 43 million tonnes by 1984-85, which would mean imports of the order of 20 million tonnes of crude oil and petroleum products that we would be making this year would be reduced substantially, This hope, however, can only materialise if there is a national energy policy, which would aim at curbing the growth rate in consumption of petroleum products and place greater reliance on coal, hydro-power, bio-gas and other new and renewable sources of energy. The enforcement of such a policy which would lead to a better utilisation of petroleum products in industry, transport and agriculture is imperative. Otherwise the growth in consumption rate of petroleum products might bounce back to nine or ten per cent despite the sharp hikes in prices of petroleum products announced last July, and imports of crude oil and petroleum products would have to be on a much higher scale than envisaged. This would mean that the import bill on account of crude oil and petroleum products, though not of the order of Rs 5,200 crores, as during 1980-81 and 1981-82, would still be a sizable one, putting strains on the foreign exchange reserves. It is the anticipated deterioration in the balance of payments position on account of heavy oil import hike that has forced the Government of India to seek a loan from the International Monetary Fund of no less than Rs 5,000 crores to tide over the situation that might arise during the next three or four years.

It is a happy coincidence that when such ambitious plans are being drawn up for the offshore production in particular, the Oil and Natural Gas Commission, founded on August 14, 1956, should be celebrating its silver jubilee. Oil India that has a 50 : 50 partnership between the Government of India and Burmah Oil is also slated to be taken over wholly by the Government by paying a compensation of over Rs 21 crores to the erstwhile private partner. The main function of the ONGC, as laid down by the statute was "to plan, promote and implement programmes for the development of petroleum resources and production and sale of petroleum products, produced by it", though later the refining of crude oil and sale of petroleum products were entrusted to the Indian Oil Corporation and the ONGC concentrated on exploration for oil and its production.

The ONGC set out on its search for oil with a government equity capital of Rs 8.43 crores during 1959-60 and today it has paid over Rs 808 crores to the Government in the form of dividends, cess, taxes and royalties. It has acquired assets worth Rs 915 crores and has grown into an organisation of 28,000 employees. These scientists, technologists and geologists of the ONGC, it is claimed, have been able to assimilate and absorb over 100 years of technology within twenty-five years of its growth and development—a fact acknowledged by the elite of the world oil industry. The ONGC has established three institutes to back its R & D efforts. These include the Institute of Petroleum, Exploration at Dehra Dun, the Institute of Drilling Technology at Dehra Dun and the Institute of Reservoir Studies at Ahmedabad. It is developing its own supply base at Nhava island off the Bombay harbour, and will operate and maintain its own three satellite earth stations linking its own communication facilities. In its growth the ONGC has been helped by such friendly countries like the Soviet Union, Romania, Yugoslavia, France, the UK, the US and Canada. It has taken up so far for drilling, both onshore and offshore 250 (199 on land and 51 offshore) structures and its success ratio has been quite high with 80 structures having been found oil and gas bearing out of the 223 tested so far. The ONGC has produced a total of over 82.17 million tonnes of oil in the two decades since 1961 and the cumulative supply of gas has been 8,245 million cubic metres. What is more it has helped to set up sophisticated oil-related industries such as the construction of rigs at Bharat Heavy Electricals and of offshore platforms at Mazagon Dock. Drilling and workover rigs, offshore platforms, supply vessels, pumps, line pipes, oil well flow control systems, power transmission systems, items of total mud systems, geo-scientific instruments, drilling bits are all now manufactured within the country.

Obviously there is a challenging task in the next five years. With the signing of a 40-year agreement with CFP of France on August 12, to help develop and exploit the oil reserves of Bombay High and other promising structures in the vicinity, the financial outlay of the ONGC's Five Year Plan for 1980-85 has been stepped up by more than 50 per cent to Rs 4,788 crores from the original figure of Rs 3,370 crores. This outlay may still go up further as, along with the accelerated development of plan for offshore fields, an accelerated plan for the eastern region is also under the consideration of the Government. The Government has, in view of this large outlay, raised the price of Rs 305 per tonne for onshore crude and Rs 475 per tonne for offshore crude to a uniform price of Rs 1,182 per tonne. The ONGC expects thus to generate enough resources internally to meet the increasing expenditure on oil exploration, development and production. But the possibility of the ONGC having to take recourse to foreign exchange loans must not be ruled out. The Petroleum Minister, Mr P. C. Sethi, has promised on behalf of the Government that there would be no dearth of finances, particularly of foreign exchange, for oil exploration. Crude oil production which was targeted at 15.5 million tonnes for the western region, 12.2 million tonnes for the eastern region an 51.3 million for offshore will also be stepped up and offshore fields are estimated to yield 89.37 million tonnes of crude and 8,258 million cubic metres of gas. The expansion plans will necessarily demand accretion in strength of the technical and scientific personnel of the ONGC. Some of the experienced personnel of the ONGC have left for more paying jobs and such a brain drain must be stopped. The Government also expects some foreign companies to undertake exploration in the country and presumably along with foreign experts they will use Indian personnel. All the three institutes that the ONGC has launched and the planned offshore technology research division in Bombay have to be strengthened. With recoverable reserves placed at present at 375 million tonnes, production at 30 million tonnes a year can be sustained only for 12 years. So new oil strikes will have to be made and both the ONGC and Oil India will have to intensify their search for oil.

Bonus guidelines : Helping investment climate

THE Government has been issuing from time to time detailed guidelines for examination of the applications for bonus issues. The successive revisions of the guidelines have served objectives such as modification, streamlining, liberalisation or tightening of the quantum and procedure of capitalising the retained earnings by companies for the issue of bonus shares. The latest guidelines announced on August 18 have modified the existing guidelines on the computation of the quantum of residual reserves and the capitalised value of earnings. Accordingly, the residual reserves after the proposed capitalisation should be at least 40 per cent of the increased paid-up capital as against 33.3 per cent heretofore. Similarly, 30 per cent of the average profits before tax of the company for the previous three years should yield a rate of dividend on the expanded capital base of the company at 10 per cent instead of 9 per cent hitherto.

The effect of the revised guidelines on the quantum of residual reserves and capitalised value of earnings is to move them upwards. If the rationale for increasing the percentage of residual reserves and for raising the capitalised value of earnings is that the reserves remaining after capitalisation should enable the maintenance of dividend in future on the expanded capital base of the company, it cannot be accepted as a satisfactory one. For all practical purposes the issue of bonus shares may prove to be a mere accounting adjustment of transferring amounts from reserves and surplus account to paid-up equity capital account unless the company at least maintains the same rate of dividend on the expanded paid-up capital base. It is true that the existing as well as the revised guidelines require the company to indicate the intention of the management regarding the rate of dividend, to be declared on the increased capital in the year immediately after the bonus issue is made, in the resolution passed by the general body meeting of the company for authorising the bonus issue. But this is clearly an inadequate and non-enforceable undertaking in respect of the maintenance of the dividend rate as any such guarantee is meaningless in so far as the actual profits which will be earned by a company, or the actual dividends which will be paid by a company, cannot be predicted or guaranteed by anybody inadvance.

On the other hand, if the rationale is to underscore the need to maintain at a high level the rate of return on equity investments in line with the increased return on debt investments brought about by the successive hikes in the rate of interest on debentures which at present remains at 13.5 per cent, the new guidelines should be welcomed. It may be recalled that when the residual reserve at 33.3 per cent and the capitalised value of earnings at 9 per cent was stipulated in 1975, the rate of interest on debentures remained at 10.5 per cent. As a corollary to the restrictions on the quantum of bonus issues, the companies may find themselves capable of making liberal dividend payments. Because of these influences, if the dividend rates take a general upturn, it will indeed give a fillip to the investment climate.

The new guidelines lay down that a company may make a further application for the issue of bonus shares only after 36 months from the date of sanction by the Government of an earlier bonus issue thereby replacing the three timing tests being applied heretofore, viz., that not more than two bonus issues will be allowed to a company over a period of five years, that between two successive announcements of bonus issues of a company, there should be a time lag of at least 24 months and that a company may make a further application for issue of bonus shares twelve months after the scrip in respect of last bonus issue is listed or after the completion of despatch of the share certificates. The new guidelines have thus widened the time lag between two successive issues of bonus shares as henceforth not more than two issues will be allowed to a company over a period of six years as against two allowed over a period of five years. Presumably, the time lag between two successive bonus issues is widened to give sufficient time to the companies to build up the increased level of residual reserves deemed necessary as per the revised guidelines. However, it may prove to be a blessing in disguise to the stock market speculators.

Apart from the above, the new guidelines have also sought to remove the two exemptions being allowed so far to the overall maximum limit for capitalisation, which is equivalent to the total paid-up capital of a company: (i) to finance approved schemes of expansion or diversification, and (ii) to bring down the foreign shareholdings under Foreign Exchange Regulation Act, 1973 (FERA) for continuance of existing business activities. The removal of the exemption allowed in respect of the bonus issues made to finance approved schemes of expansion or diversification may prove contrary to the present attempts of the Government in reducing the dependence of the corporate sector on the financial institutions. There is a strong case for its restoration.

The bonus issue guidelines announced on August 18 contain, in addition, two new clauses. According to the first clause, no bonus issue will be permitted if there is sufficient reason to believe that the company has defaulted in respect of the payment of statutory dues to the employees such as contributions for provident fund, gratuity, bonus, etc. As per the second clause, in cases where there is any default in the payment of any term loans outstanding to any public financial institution, a no-objection letter from that institution in respect of the issue of bonus shares should be furnished by the company concerned along with the bonus issue application. These stipulations should be described as good legislation in keeping with the changing concepts of social responsibility of corporate managements.

Export-Import Bank

THE much-awaited legislation on the formation of the Export-Import Bank has been passed by the Lok Sabha on August 18. The Export-Import Bank of India, to be so constituted, would provide financial assistance to exporters and importers and function as the principal financial institution for co-ordinating the working of institutions engaged in financing export and import of goods and services in the widest sense of the terms. It would refinance commercial banks and financial institutions in their export-import-financing activities.

The functions of the bank would include: (a) financing of exports from and imports into not only India, but also third countries of goods and services; (b) financing of joint ventures in foreign countries; (c) financing of export and import of machinery and equipment on lease basis; and (d) providing loans to an Indian party so as to enable it to contribute in the share capital of a joint venture in a foreign country. It would also undertake limited merchant-banking functions such as underwriting of stocks, shares, bonds or debentures of companies, engaged in the export or import and providing technical, administrative and financial assistance to parties in connection with export or import. The Export-Import Bank can also undertake the developing and financing of export-oriented industries. It is also proposed to entrust the Export-Import Bank with the task of undertaking transactions involving a combination of government-to-government and commercial credit for the purpose of export or import. The bank would also give lines of credit to foreign governments and foreign financial institutions and enter into collaboration with similar institutions in developing countries through participation in the share capital of such institutions.

The bank would have an authorised capital of Rs 200 crores which may be increased by the Central Government to Rs 500 crores. The issued capital would be wholly subscribed by the Central Government. Rs 50 crores has been provided in the budget for 1981-82 towards the issued capital of the bank. Rs 25 crores would be contributed by the Central Government each year from 1982-83 to 1987-88 so that the paid-up capital is brought up to the authorised capital of Rs 200 crores. The Central Government would grant a soft-loan of Rs 20 crores to the bank which would be repayable in fifteen annual instalments after a moratorium of fifteen years, the rate of interest being five and a quarter per cent. The bank would also be able to borrow from the open market through the issue of bonds and debentures. Funds from the National Industrial Credit (Long-term Operations) Fund, set up by the Reserve Bank of India at the time of the establishment of the Industrial Development Bank of India, would also be available to the Export-Import Bank for the purpose of its business. The bank would be able to borrow foreign currency in or outside India as also to raise resources by acceptance of gifts and grants.

The Export Development Fund to be set up would be utilised for purposes like research, training, survey and market intelligence relating to India's international trade. The business of the Industrial Development Bank of India (IDBI) in so far as it relates to the export financing functions would be transferred to the Export-Import Bank. The bill also provides for the transfer to the Export-Import Bank of any other functions of the Industrial Development Bank of India. The bank will be exempt from the payment of income tax and all other taxes on income, profits or gains, on the lines of exemptions given to the Reserve Bank of India and the Industrial Development Bank of India. The Export-Import Bank will be able to appoint its nominees on the boards of directors of companies assisted by it.

LETTER FROM LONDON

FRANK BROADWAY

Interest rate dilemma

WHILE politicians and economists continue to disagree about the exact point Britain has reached in the cycle of recession and recovery, bankers, businessmen and Treasury officials have been worrying about interest rates.

The arguments about whether or not the recession has ended which have made headlines in Britain, hinge on the definition of a recession. The Chancellor of the Exchequer, Sir Geoffrey Howe, believes the worst is over because for most of this year the economic indicators have been signalling a progressive slowing in the rate of decline. Critics believe that a recession has not ended until there are positive signs of recovery. If the two camps got together and agreed that the economy was bumping along the bottom and recovery would be slow, they would achieve an accurate, if inelegant, description of the situation.

In constrast to the wordy arguments over economic prospects, the interest rate dilemma is real and earnest. It affects the sterling exchange rate, and consequently the prospects for continuing decline in the inflation rate. It also affects profitability in British industry, and the chances for economic recovery.

The basic dilemma is that there is an unusually widespread of short-term interest rates among the major industrial nations, ranging from under ten per cent in Japan to prime rates of twenty per cent and over in the United States and Italy.

Britain is well towards the lower end of the range, with short-term rates based on an official minimum lending rate (MLR) of 12 per cent, although this guideline is to be abolished on August 20 to give the financial markets a greater role in deciding the level of rates. The relatively low level of interest rates in Britain is the result of government policy intended to help economic recovery.

In March, the Chancellor of the Exchequer announced a cut in MLR from fourteen to twelve per cent as the major concession to industry in an otherwise tough budget. The expectation at the time was that there might be further cuts in British interest rates as the years progressed.

In fact, a number of pressures have developed which have recently made the money markets speculate on the possibility that the authorities might have to accept a general rise in interest rates.

The most obvious pressure has come from the dramatic fall in sterling against the US dollar. On budget day in March, the pound closed at 2.2285 dollars. It has recently been traded at under 1.84 dollars. The main reason for the fall, and for continuing instability, is the big interest rate differential between London and New York. Also petro-currencies, of which sterling is one, have lost some of their attractions in face of the current oil glut.

In March, the pound had already fallen some twenty cents from its peaks in January, and the British authorities doubtless expected it to fall further when they lowered interest rates at a time when American interest rates were rising. In the event it may have fallen too far too fast, and uncertainty about possible further decline is adding to the uneasiness of world currency markets. With many of Britain's imports denominated in dollars, the sterling cost of industry's raw materials is beginning to edge up, threatening a resumption of inflation after the encouraging decline of recent months.

The Government's policy is to leave the exchange rate to be determined primarily by market forces. Whether the rate is rising or falling, intervention by the authorities is limited to "smoothing" in order to moderate excessive fluctuations and preserve orderly markets. The Bank of England did allow short-term interest rates to rise during July because it was felt to be appropriate to bring shorter-term interest rates into line with longer-term rates. Clearly the exchange rate is one of the factors taken into account in judging monetary and financial tightness and in deciding on the appropriate level for interest rates.

With the US authorities reiterating that high interest rates will remain until at least the end of the year, some economists believe it may be difficult to achieve stability in sterling exchange rates without increases in British interest rates.

Apart from exchange rate pressures, technical factors in the London money markets are also signalling a general increase in short-term rates. This partly reflects the attractions of lending abroad, but the commercial banks are also anxious to raise overdraft rates to improve the ratio between deposits and lending.

Set against the pressures to allow interest rates to rise is the Government's natural reluctance to do anything to set back economic recovery. As the Confederations of British Industry has pointed out, higher interest rates would increase the costs of stockholding and investment, and eventually feed through into higher consumer prices or reduced profits.

The end of MLR on August 20 may help to ease the Government's difficulties. It will not be replaced by any new official rate but the Bank of England will aim to keep short-term rates within an undisclosed band, which will be changed from time to time, depending on monetary conditions. The intention is to reduce delays in changing interest rates and to give the financial markets a greater role in deciding the level of rates. At the same time it will give the authorities better control over growth in the money supply.

The progress of the medium-term, financial strategy is difficult to judge because of distortions caused by the 21-week civil service industrial dispute, which has now been settled within the Government's pay limits. The major distortion has arisen from delay in collecting taxes estimated to total around £6 billion, but adjusted figures for the money supply suggest that it is being held within the Chancellor's six to ten per cent annual growth guidelines.

The struggle to keep the public sector borrowing requirements in line with the Chancellor's projections will be resumed when Ministers return from their summer holidays and the Government seeks a further round of public spending cuts.

Although the Govenment firmly rejects any involvement with an incomes policy, the coming winter's round of wage negotiations will have a crucial

Continued on page 390

Oil policy in the eighties

By **P. C. SETHI,** *Union Minister for Petroleum and Chemicals*

THE repercussions of recent increases in oil prices on the Indian economy have been many. Among these are the high cost of oil imports, substantial trade deficits and cost-induced inflation. In the early years of the oil crisis, these effects were not as severely felt as now. In 1980-81, the import bill on account of crude oil and products was Rs 5,167 crores, as compared to Rs 3,212 crores in 1979-80 and Rs 541 crores in 1973-74.

The import of crude oil and products in 1980-81 was 16.25 million tonnes and 7.06 million tonnes respectively. The respective figures for 1973-74 were 13.87 million tonnes and 3.55 million tonnes and for 1979-80, 16.12 million tonnes and 4.48 million tonnes. Though the quantitative difference in imports in the last two years was only about 2.5 million tonnes, it will be observed that the difference in cost was around Rs 2,000 crores. This shows the magnitude of the rise in petroleum prices in the world market in a single year alone.

There is currently a glut in the oil market due to the slower growth in oil consumption in advanced countries, higher prices of certain OPEC crudes and less stockpiling demand. Consequently, in the June OPEC meeting a price freeze was announced. But the easy supply conditions may be a transient feature only once the major exporters of crude oil start imposing production cuts to tighten the market conditions. Our dependence on imported crude oil for meeting domestic demand was to the extent of about 63 per cent in 1980-81, as compared to 61 per cent and 64 per cent respectively in 1975-76 and 1970-71. As regards product imports they constituted 6 per cent, 9.8 per cent and 23 per cent of our total oil consumption in 1970-71, 1975-76 and 1980-81. It is these two factors — high cost of oil imports and high level of import dependence — which have brought oil policy into sharp focus and have made it a major concern of every one.

The two main aspects of our oil policy for the present decade are : (1) intensification of domestic exploration and stepping up of oil production, and (2) curbing of oil consumption. These, in other words, are the supply and demand dimensions of the oil problem. I shall briefly touch upon these areas in the following sections.

(1) *Domestic exploration and development of oil reserves* : To increase domestic production the basic prerequisites are substantial proven and recoverable oil reserves, adequate finance and technology. The country's proven and balance recoverable reserves were 366 million tonnes only at the beginning of last year and our annual consumption of petroleum products at present is around 30 million tonnes. The additions to the reserves through new discoveries have been varying from four per cent to ten per cent every year. One country which recently achieved self-sufficiency in oil is the UK and this country had total recoverable reserves ranging from 2.2 to 4.3 billion tonnes in 1980. The UK's total oil consumption last year was 71 million tonnes or 0.6 per cent of total recoverable reserves. In our case last year's consumption was 8.5 per cent of proven reserves. Besides this, in Britain the goal of self-sufficiency was also the immediate result of reduced consumption. As at present, our limited oil reserves do not permit us to drive too far in the direction of self-sufficiency.

Mr P. C. Sethi

Enlarging reserves

Finance and technology are the other two constraints in increasing domestic production. For several projects of oil exploration and production, the Government is seeking financial assistance from the World Bank, Exim Bank of USA, the Euro-dollar market etc in the case of offshore in particular. We are deficient in technology and equipment like drilling rigs. Nevertheless, these may be considered short-run handicaps, while the size of oil reserves is a basic cause for concern.

To enlarge the size of reserves, the ONGC and Oil India have been undertaking geological and geophysical surveys and studies, besides, exploratory drilling. During 1978-81, the ONGC conducted 132 party years of surveys in onshore and offshore areas and expects to conduct another 218 party years of surveys in the onshore alone in the next four years, that is, 1981-85. In the case of exploratory drilling, the ONGC was able to drill 159 wells covering 3.65 lakh metres in onshore and 82 wells covering 2.40 lakh metres in the offshore during 1981-85.

Though the achievements in the last three years against the targets for surveys and drilling have been unsatisfactory, the ONGC has been able to discover a few new sources of oil or gas at Dehej, Lohar and Mahi High in the western region and Cachar, Napampua, Rokhia and Gojalia in the eastern region. Oil was also discovered in Godavari and Ratnagiri structures. As a part of increasing the tempo of exploration in the Sixth Five Year Plan, the ONGC will explore prospective shoal areas between the Mahi and Tapti rivers in the Gulf of Cambay and in areas like the Patan depression in the northern part of the Sanchar-Barmer basin and in Kutch and Saurashtra. In the eastern region, it is planned to start drilling in virgin areas like the Dhansari valley and also in Cachar. Exploration work will also be taken up in the northern bank of Brahmaputra, Cauvery basin, the Sunderbans in West Bengal, Tripura and the Vindhyas. In the offshore, too, the ONGC will continue to conduct surveys and exploration.

Oil India's exploration work is confined to Assam, Arunachal Pradesh and the Mahanadi basin. Its role at present is not as extensive as that of the ONGC. To supplement the exploration activities of these two agencies, the Government is trying to involve foreign oil companies with their finance and technology. The first round of negotiations is going on and we hope to achieve some results in this regard in the near future.

Production

On the production side, the total domestic production of crude oil in 1980-81 was 10.5 million tonnes, as compared to 11.7 million tonnes in the previous year. In the last year there was a shortfall in crude production owing mainly to the Assam agitation. In the next four years, the ONGC's target of total production is 24.1 million tonnes from onshore fields and 46.1 million tonnes from offshore areas. However, in view of the mounting burden of oil imports, an accelerated plan to raise the ONGC's production from 46.1 to 58.14 million tonnes from the offshore areas has recently been drawn up and is under the active consideration of the Government. The yearwise break-up of the ONGC's onshore and offshore production for the remaining four years of the Sixth Plan is as shown in Table 1.

The onshore production target of 24.1 million tonnes may also be revised upwards and the necessary accelerated plan is under preparation.

(2) *Curbing oil consumption*: Demand management has a major role to play in any meaningful oil policy. In 1980-81 our total oil consumption was 30.79 million tonnes, consisting mainly of high speed diesel oil (33.5 per cent), kerosene (13.7 per cent), fuel oil (24.1 per cent), naphtha (7.5 per cent), and motor gasolene (4.9 per cent). The projections for petroleum consumption for the Sixth Plan (1980-85) and for 1989-90 are given in Table 2.

Table 1 : ONGC's planned production

(Million tonnes)

(1) Offshore production

Year	Sixth Plan	Accelerated plan
1981–82	8.4	8.5
1982–83	11.8	13.95
1983–84	12.7	16.67
1984–85	13.2	19.12
Total	46.1	58.14

(2) Onshore production

Year	Western region	Eastern region	Total
1981–82	3.7	2.2	5.9
1982–83	3.4	2.6	6.0
1983–84	3.1	3.0	6.1
1984–85	3.1	3.0	6.1
Total	13.3	10.8	24.1

Even though the scope for conservation of oil in a developing country like ours may not be as much as in advanced countries, still there is considerable scope for reducing consumption of diesel oil, fuel oil, kerosene, light diesel oil, naphtha and other products. Pricing of petroleum products has some effect on inter-fuel substitution and also on checking consumption. The recent increases in domestic petroleum prices have to be partly viewed in this context. While the decision-making on the supply side of oil lies with the government agencies, the decision-makers on the demand side are numerous households, industries, transport operators, etc. The Government can only prod and encourage them through appropriate policy measures and other steps to economise oil consumption. Insufficient availability of coal, power and suitable technologies for substitute fuels, delay on the part of railways to effectively replace road transport in respect of long distance movement of goods and passengers and absence of adequate incentives for energy-saving equipment and processes are among the major negative factors encouraging oil demand.

Product-wise, the largest increase in consumption during 1970-81 was in the case of high speed diesel (169 per cent), fuel oil (59 per cent), naphtha (157 per cent), domestic cooking gas (126 per cent), and aviation fuel (64 per cent). The demand for petrol rose only by five per cent, kerosene by 28 per cent and light diesel oil by three per cent during the same period. It may be mentioned here that the Petroleum Conservation Research Association under the Department of Petroleum is engaged in conducting surveys and case studies and in disseminating useful information to end users on measures to conserve oil.

The average annual growth rate of petroleum consumption anticipated during the Sixth Plan is 7.7 per cent and for the next five years (1985-90) 6.4 per cent. Among the products with relatively high

Table : 2 Projected demand for petroleum products (million tonnes)

Year	Total consumption
1980–81	30.79 (provisional)
1981–82	34.74
1982–83	37.34
1983–84	40.17
1984–85	42.83
1989–90	62.55

TAX DEDUCTION AT SOURCE IS OBLIGATORY

IF YOU are responsible for paying any
- SALARIES
- INTEREST exceeding Rs. 1,000/- by credit or otherwise (other than Interest on Securities)
- AMOUNT TO A CONTRACTOR OR SUB-CONTRACTOR by credit or otherwise where the value of the contract exceeds Rs. 5,000/-.
- WINNINGS exceeding Rs. 1,000/- FROM LOTTERIES OR CROSSWORD PUZZLES, OR FROM HORSE RACING in excess of Rs. 2,500/-.
- OTHER SUM TO A NON-RESIDENT (other than Interest on Securities or Dividends).

You are liable :
- ★ to deduct tax at the appropriate rate therefrom.
- ★ deposit the tax deducted to the credit of Government within the time allowed.
- ★ file the appropriate statement with your I.T.O., indicating the deduction made.

Meet your liability well in time
DEFAULT ATTRACTS PENALTY

For further details and guidance approach your I.T.O. or the P.R.O. in the office of the Commissioner of Income-tax.

For attention of recepient

If you are in receipt of any income from the sources mentioned above and your total income justifies deduction of tax therefrom at a lower or NIL rate, you can approach your I.T.O. for a certificate showing such lower rate applicable to you and the person paying the income will then deduct tax only at that rate.

nnual growth rates during the Sixth Plan are kerosene (eight per cent), high peed diesel oil (10 per cent), light diesel il (six per cent) and aviation turbine uel (10 per cent). The major products that are likely to be in deficit at the end of the Plan are high speed diesel, light liesel, kerosene and fuel oil.

The rapid industrialisation and urbanisation that accompanies economic growth are bound to increase energy use, ncluding that of oil. However, attempts have to be made to minimise the use of oil on a product-to-product basis. The areas where checks could be applied are transport sector (diesel oil), agriculture (light diesel oil), industries (diesel oil and fuel oil) and household sector (kerosene). The transport sector, in particular, needs a complete change in priorities because high speed diesel, which is mostly consumed by this sector accounts for around 33 per cent of total consumption of oil and because it has the highest rate of growth. Large scale electrification of railways and greater emphasis on passenger and goods traffic by rail can reduce the diesel consumption substantially.

Our dependence on oil imports will continue to be significant in the immediate future. But, with the acceleration in production programme, imports of crude oil and products as a percentage of total demand of petroleum products should decline from the current level of about 70 per cent to about 47 per cent in 1984-85. But the trend can reverse if we slacken our efforts in regard to exploration and demand management.

COMMERCE RESEARCH BUREAU

PREMIER CENTRE
FOR MONITORING CURRENT DEVELOPMENTS
IN THE INDIAN ECONOMY

*The research work of the Bureau is organised through these nine Divisions: (1) Agriculture, (2) Industry, (3) Corporate Sector, (4) Regional Economics, (5) Banking and Finance, (6) International Economics, (7) Unorganised Sector, (8) Science and Technology, and (9) Special Studies.

*Each Division is manned by experts who have specialised in their respective subjects.

*Over the years the Bureau has built up a comprehensive economic data system which is the only one of its kind in the country today.

*Through its studies published in the "Commerce" weekly and its special numbers, the Bureau has established a high reputation for itself.

*Its exclusive and prestigious "Economic Monitoring Service" is subscribed to by some of the foremost organisations in the public and private sectors.

All enquiries may be addressed to:

Phone : 24 14 23

next four years, the ONGC's target of total production is 24.1 million tonnes from onshore fields and 46.1 million tonnes from offshore areas. However, in view of the mounting burden of oil imports, an accelerated plan to raise the ONGC's production from 46.1 to 58.14 million tonnes from the offshore areas has recently been drawn up and is under the active consideration of the Government. The yearwise break-up of the ONGC's onshore and offshore production for the remaining four years of the Sixth Plan is as shown in Table 1.

The onshore production target of 24.1 million tonnes may also be revised upwards and the necessary accelerated plan is under preparation.

(2) *Curbing oil consumption*: Demand management has a major role to play in any meaningful oil policy.

Table 1 : ONGC's planned production

(Million tonnes)

(1) Offshore production

Year	Sixth Plan	Accelerated plan
1981–82	8.4	8.5
1982–83	11.8	13.95
1983–84	12.7	16.67
1984–85	13.2	19.12
Total	46.1	58.14

(2) Onshore production

Year	Western region	Eastern region	Total
1981–82	3.7	2.2	5.9
1982–83	3.4	2.6	6.0
1983–84	3.1	3.0	6.1
1984–85	3.1	3.0	6.1
Total	13.3	10.8	24.1

In 1980-81 our total oil consumption was 30.79 million tonnes, consisting mainly of high speed diesel oil (33.5 per cent), kerosene (13.7 per cent), fuel oil (24.1 per cent), naphtha (7.5 per cent), and motor gasolene (4.9 per cent). The projections for petroleum consumption for the Sixth Plan (1980-85) and for 1989-90 are given in Table 2.

Even though the scope for conservation of oil in a developing country like ours may not be as much as in advanced countries, still there is considerable scope for reducing consumption of diesel oil, fuel oil, kerosene, light diesel oil, naphtha and other products. Pricing of petroleum products has some effect on inter-fuel substitution and also on checking consumption. The recent increases in domestic petroleum prices have to be partly viewed in this context. While the decision-making on the supply side of oil lies with the government agencies, the decision-makers on the demand side are numerous households, industries, transport operators, etc. The Government can only prod and encourage them through appropriate policy measures and other steps to economise oil consumption. Insufficient availability of coal, power and suitable technologies for substitute fuels, delay on the part of railways to effectively replace road transport in respect of long distance movement of goods and passengers and absence of adequate incentives for energy-saving equipment and processes are among the major negative factors encouraging oil demand.

Product-wise, the largest increase in consumption during 1970-81 was in the case of high speed diesel (169 per cent), fuel oil (59 per cent), naphtha (157 per cent), domestic cooking gas (126 per cent), and aviation fuel (64 per cent). The demand for petrol rose only by five per cent, kerosene by 28 per cent and light diesel oil by three per cent during the same period. It may be mentioned here that the Petroleum Conservation Research Association under the Department of Petroleum is engaged in conducting surveys and case studies and in disseminating useful information to end users on measures to conserve oil.

The average annual growth rate of petroleum consumption anticipated during the Sixth Plan is 7.7 per cent and for the next five years (1985-90) 6.4 per cent. Among the products with relatively high

Table : 2 Projected demand for petroleum products (million tonnes)

Year	Total consumption
1980–81	30.79 (provisional)
1981–82	34.74
1982–83	37.34
1983–84	40.17
1984–85	42.83
1989–90	62.55

TAX DEDUCTION AT SOURCE IS OBLIGATORY

IF YOU are responsible for paying any
- SALARIES
- INTEREST exceeding Rs. 1,000/- by credit or otherwise (other than Interest on Securities)
- AMOUNT TO A CONTRACTOR OR SUB-CONTRACTOR by credit or otherwise where the value of the contract exceeds Rs. 5,000/-.
- WINNINGS exceeding Rs. 1,000/- FROM LOTTERIES OR CROSSWORD PUZZLES, OR FROM HORSE RACING in excess of Rs. 2,500/-.
- OTHER SUM TO A NON-RESIDENT (other than Interest on Securities or Dividends).

You are liable :
★ to deduct tax at the appropriate rate therefrom.
★ deposit the tax deducted to the credit of Government within the time allowed.
★ file the appropriate statement with your I.T.O., indicating the deduction made.

Meet your liability well in time
DEFAULT ATTRACTS PENALTY

For further details and guidance approach your I.T.O. or the P.R.O. in the office of the Commissioner of Income-tax.

For attention of recepient

If you are in receipt of any income from the sources mentioned above and your total income justifies deduction of tax therefrom at a lower or NIL rate, you can approach your I.T.O. for a certificate showing such lower rate applicable to you and the person paying the income will then deduct tax only at that rate.

annual growth rates during the Sixth Plan are kerosene (eight per cent), high speed diesel oil (10 per cent), light diesel oil (six per cent) and aviation turbine fuel (10 per cent). The major products that are likely to be in deficit at the end of the Plan are high speed diesel, light diesel, kerosene and fuel oil.

The rapid industrialisation and urbanisation that accompanies economic growth are bound to increase energy use, including that of oil. However, attempts have to be made to minimise the use of oil on a product-to-product basis. The areas where checks could be applied are transport sector (diesel oil), agriculture (light diesel oil), industries (diesel oil and fuel oil) and household sector (kerosene). The transport sector, in particular, needs a complete change in priorities because high speed diesel, which is mostly consumed by this sector accounts for around 33 per cent of total consumption of oil and because it has the highest rate of growth. Large scale electrification of railways and greater emphasis on passenger and goods traffic by rail can reduce the diesel consumption substantially.

Our dependence on oil imports will continue to be significant in the immediate future. But, with the acceleration in production programme, imports of crude oil and products as a percentage of total demand of petroleum products should decline from the current level of about 70 per cent to about 47 per cent in 1984-85. But the trend can reverse if we slacken our efforts in regard to exploration and demand management.

Special Reports

Financial needs of private industry

From P. C. MAHANTI

CALCUTTA

FINANCE for the private sector is an engaging subject, for the private sector is still responsible for the major part of the economic activity in the country. A study such as the one the Indian Chamber of Commerce has made on the financial needs of private industry, in the context of the Sixth Plan development programme is, therefore, to be welcomed. The study begins by pointing out that this sector has been assigned a bigger role in industrial development during the Sixth Plan than with previous one. It is required to invest in mining and manufacturing some Rs 15,182 crores. Rs 19,582 if the shares of the co-operative sector is taken into account. The non-financial services are also thrown in.

Investment in mining and manufacturing (including small and village industries) in the past has been nearly one-third of the total private investment. The ratio would go up to 41 per cent in the Sixth Plan. The following is the broad pattern :

(In crores of rupees at 1979-80 prices)

Industry group	Total
Mining	25*
Metallurgical	1,244
Engineering	2,463
Chemicals	3,920
Consumer Industries	5,375
Miscellaneous	2,155
Total	15,182

* Excluding captive mining which is included under respective industries.

On the above basis, the average annual private investment in industry works out to Rs 300 crores — just double of the current rate of investment per year in private industry. But far from enabling the private sector to raise the level of its investment, even the current level cannot be maintained if the constraints mentioned in the study are not removed.

Explaining how paucity of finance, both for working capital and for new investment, has been one of the major constraints for expansion as well as for the creation of new capacity, the study points to a number of factors that are posing problems: financial needs are increasing yearly due to continuing inflationary pressures and the rise in costs of new project. Investment costs in India have been rising at rates ranging from seven per cent to 13 per cent in key industries such as sugar, cotton textiles, steel, aluminium, fertiliser, paper, cement etc. In the last five years the project costs have almost doubled. The study gives the following examples. A sugar project of 1,250 tonnes capacity costs Rs 6.5 crores today as compared to Rs 3.5 crores in 1973; the capital cost of a cement plant is around Rs 720 per tonne now as against Rs 450 per tonne in 1974; a mini paper plant costs Rs 5,900 per tonne compared to Rs 3,800 per tonne only four years ago. Moreover, industries will face substantial resources gap for financing replacement costs during the current decade ranging from 20 per cent to 70 per cent.

Against this background of a high investment target and falling generation of internal resources in industry, a sluggish capital market and increasing difficulties in borrowing from financial institutions, the study examines the nature of the task facing private industry for fulfilling the allotted Sixth Plan development programme.

The fact that external sources now provide the major part of the funds for private industry is adequately brought on with a full statistical picture of the sources from which finance comes. Share capital has become a diminishing source while bank borrowings have become the largest, as table 1 shows.

Internal sources like reserves and surplus and provisions for depreciation and taxation contribute less than 22 per cent of the funds employed in industry today. The study also points out that the corporate sector's retained profits available for plough back show a declining trend. Between 1970-71 and 1977-78 retained profits fell from Rs 167 crores to Rs 154 crores. The retained profits as percentage of profits before tax declined sharply from 31.2 in 1970-71 to 17.2 in 1977-78. The table below gives some indication of how the internal resources of companies have been steadily taxed away :

	1970-71 (1,650 companies)	1977-78 (1,720 companies)
	(Rs crores)	
Profit before tax	536	896
Tax provision	223	515
Profit after tax	313	381
Dividends	145	228
Retained profits	167	154
Tax provision as % of profit before tax	41.6	57.5
Profit after tax as % of net worth	11.7	8.9
Profit retained as % of profit before tax	31.2	17.2

Table I : Source of funds for private industry

Source	Funds from different sources as % of total funds employed		
	1975-76	1976-77	1977-78
Share capital	16.9	16.9	16.6
Reserves and surplus	17.9	17.1	16.7
Provisions	6.1	5.6	5.3
Borrowings (of which from banks)	35.0 (18.9)	35.4 (19.2)	35.3 (19.0)
Trade dues and other current liabilities	24.1	24.9	26.1

The high level of taxation apart, two other factors which are cutting deep into the internal resources of companies are controls and wrong pricing policies and historical cost principle of depreciation. Industries can build internal resources if the level of corporate taxation is reasonable not at the predatory levels prevailing at present. A pricing policy for controlled industries which ensures a reasonable return on capital employed and a depreciation allowance on the replacement cost principle is also essential.

Even if the Government acts on the above suggestions, private industry would still need to fall back on external sources for the major part of its financial needs. The changes would take time to yield the derived result. But the capital market is sluggish and not in a position to resume its old role in financing industrial development or growth. The share boom gives a completely misleading picture of the state of the capital market, for the boom centres round the shares of old and established companies. The new issues market is not faring well at all. Convertible debentures are proving attractive to the investors, but the interest will not be sustained unless a secondary market also develops. As for the ordinary stock, the yield on equity has to be much more than 6 per cent, the average rate of return available today and the banks must lend against shares to improve their liquidity. A third way is to raise the tax free exemption limit of investment in shares from the present Rs 5,000 to something like Rs 15.000. Yet another suggestion is that capital gains tax should not be levied when capital appreciation in share values is invested in shares again. The private sector must be allowed to set up investment trusts or mutual funds on the lines of the Unit Trust of India and efforts should be made to expand the market for equities beyond urban centres. Public deposits have become a useful source of finance but limiting the interest payable to 15 per cent is limiting the flow of funds, as more attractive alternatives are available.

Term lending institutions, a substantial sources of finance these days, are themselves experiencing a shortage of finance. Between 1971-72 and 1979-80, these institutions raised their assistance from Rs 191.4 crores to Rs 1,203.8 crores. By the end of March 1980, they had invested some Rs 613 crores in company shares. With the constraint of a funds shortage developing in their own resources, these institutions have been inclined to impose more stringent conditions. The present debt-equity ratio is an unhelpful factor, a high rate of promoter's contribution is another; yet another is the high rate of interest charged. And institutional underwriting for medium scale projects with investments up to Rs 2 crores is simply not available.

The study suggests that the debt-equity norms need further liberalisation, especially in the case of projects with high capital intensity and a high import content. Interest on term loan should be kept down to a reasonable level and the conversion clause should be totally removed.

To the subject of bank finance, appropriately large space is devoted. It is by far the most important source of working capital, for some almost the only source. As it is now sought to reduce bank credit to industry further considerable difficulties is apprehended. If the Chore Committee's recommendations are accepted, credit restrictions will become even tighter. Between March 1968 and June 1980, the share of large and medium industry in total bank credit fell from 60.6 per cent to 38.2 per cent and that of wholesale trade other than food procurement from 14.2 to 9 per cent. At the same time, the cost of credit has been raised progressively — Bank rate from 5 per cent to 9 per cent and then to 10 per cent, and the commercial bank's advance rate from 7 to 8.5 per cent up to a maximum of 19.5 per cent. In view of various restrictions on bank credit, additional advances to industry have declined from Rs 1,042 crores in 1978-79 to Rs 1,019 crores in 1979-80. Table 2 summarises the position.

Table 2: Bank credit

	Outstanding June 1978	Outstanding June 1979	Variation over the year	Outstanding June 1980	Variation over the year
Industry (medium and large).. ..	6,249 (39.2)	7,291 (37.7)	+1,042	8,310 (38.2)	+1,019
Gross bank credit	15,960 (100.0)	19,343 (100.0)	+3,383	21,749 (100.0)	+2,406

Note: Figures in brackets are percentages to total gross bank credit.

The study stresses that quantitative restrictions on bank credit will lead to contraction in industrial activity in face of the current inflationary rise in operational costs. Considering the implication of a serious credit squeeze, the study suggests that the Chore Committee's recommendations be postponed until a fresh review of industry's credit requirement is undertaken. It is also suggested that interest rate on advances should be reduced and in view of rising project costs, the CAS cutoff point should be raised from Rs 2 crores to Rs 5 crores.

The study makes a strong case for the private sector in India to borrow abroad in a big way. Considering the huge volume of funds now available in the international capital market it should not be difficult to attract part of this money. The Arab funds in particular can be attracted by suitable inducements such as high returns and tax concessions. The Eurodollar market also has been lending substantial funds to developing countries especially Brazil, Mexico, Venezuela and South Korea, and India will certainly qualify as a good risk considering its own record in the matter of repatriation of dividends on foreign investment in the country and of principal as well.

The study ends by summing up its earlier recommendations on taxation, credit policy, monetary policy, and the revival of the capital market, but has nowhere stated how much of the required investment under the Sixth Plan, private industry will be able to raise on its own and how much it will have to find from outside sources. To balance the contents the study should have given a list of incentives and reliefs available for new industries or expansions in selected sectors and areas and how these help capital formation in the private sector.

'Better trade than aid'

BOMBAY

WEST Germany's budget will increase by 4.2 per cent and its developmental assistance by 7 per cent in 1982, the Federal Minister of Economics, Dr Otto Graf Lambsdorff announced here while addressing the Indo-German Chamber of Commerce at its twenty-fifth anniversary celebrations. He said, India received the largest share of development assistance from the Federal Government, which it would try to maintain. But he made no secret of the fact that there were substantial hurdles in the way of gaining political approval for such a high level of funding for development assistance.

Lauding the role played by the Indo-German Chamber of Commerce, the first German chamber of its kind in Asia, in promoting trade between the two countries, Dr Lambsdorff said that bilateral trade had nearly doubled in the past five years. For some years now, a number of dynamic developing countries have been offering goods on international markets. In terms of quality and technology these goods are thoroughly capable of competing with comparable product from traditional industrial countries. India is increasingly taking its place as a member of this group.

In fields which were less technology intensive—the textile and garment industry or footwear and leather goods manufacture, for instance—a number of developing countries had carved out a solid share of the world market years ago. In the wake of this development, affected branches in the industrial countries had to undergo and were still subject to adjustment processes which were not without some pain. Tougher international competition among the industrial countries themselves had also caused serious structural changes. Dr Lambsdorff said that there was absolutely no doubt in his mind that worldwide adjustment to these changed international economic patterns could only proceed under the conditions of an open system of world trade.

The temptation was great, especially in times of a downswing in the economy, to dodge the challenge by means of protectionist measures and by granting domestic economic subsidies to continue existence Dr Lambsdorff said. But India had resisted this temptation. Despite many difficulties, it had maintained the liberalisation introduced at the end of the seventies. In his opinion, this was the only path to take. In the short term, companies and employees would appear to be helped by protectionist measures. But in the medium term, disadvantages clearly outweighed apparent benefits. The fact that the western countries had, in principle, recognised this necessity was shown by the numerous international declarations and agreements in recent years. Most recently, the necessity was reasserted at the Ottawa summit.

Dr Lambsdorff said the topic of protectionism was of decisive importance in the relationship between the industrial and developing countries. Protectionism was the most formidable enemy of the integration of the countries of the Third World into the world economy. And this integration was a prerequisite for lasting success in remedying the disequilibrium between North and South. "Better trade than aid" was the principle which should guide efforts. For this very reason, the industrial countries should accept the challenge of foreign suppliers on domestic markets and on third markets without in advance setting up a wall of governmental protection.

Referring to the Multi-Fibre Arrangement, Dr Lambsdorff said that the West German Government was going to work for a limited extension of the Arrangement even though it could not serve as a lasting solution to problems and appeared as a element alien to the system of free world trade. He believed if the present Arrangement were to expire without renewal, the result could doubtedlessly be a number of national protective and retaliatory measures and would represent a serious test of the overall system of international trade, beyond the restricted area of the textile sector.

Dr Lambsdorff highlighted some of the problems of the least developed countries and said, despite all efforts, in the foreseeable future, it would hardly be possible to integrate them sufficiently into the world economy, even with a free international exchange of goods. An issue in these countries was not temporary sluggishness in growth or setbacks in prosperity; rather the problem was meeting elementary needs. Public assistance from the industrial countries must bear the main burden here.

Pointing out to the poor contributions to development assistance made by

East European countries, Dr Lambsdorff said that he regarded it as scandalous that the entire development assistance from the Eastern bloc did not amount to half of that provided by the western countries. Moreover, the assistance granted by these states was predominantly sent to only two developing countries—Cuba and Vietnam. The western industrial countries should not hesitate, time and again, to point to this deplorable state of affairs, particularly within the forum of the North-South dialogue.

Commending the progress made on certain issues at the conference in Cancun, Dr Lambsdorff said that too much should not be expected of such conferences and there should not be any illusions. As if hypnotised, the international discussion was fixed on the level of development assistance granted. But these funds could only play a secondary role. The entire amount of development assistance granted last year by the industrial countries of the west was not even enough to cover the increases in oil expenditure of the developing nations, he reminded.

Describing efforts made by the West German Government to promote imports from developing countries, Dr Lambsdorff said that, import restrictions, of whatever sort, were not in harmony with the principles advocated by the Federal Republic of Germany. By providing information and consulting services, the West German Government even promoted imports from developing countries on a not inconsiderable scale. On the export side, direct subsidies clash with the principle of worldwide competition of products with as little distortion as possible. The Federal Republic, therefore, believed in governmental promotion of exports only where it appeared necessary and effective. He said that the West German Government was ardently attempting within the consensus of the OECD to eliminate measures which distort competition, measures especially used by some high interest countries.

Dr H. Langer, president of the Indo-German Chamber of Commerce said that, Indo-German co-operation had come a long way since the modest beginnings of the early fifties. As compared to 1956, the volume of trade had grown two and a half times, the number of joint ventures ten times and the number of licence agreements several hundredfold.

Carpets: Competition from China

From O. N. KOUL

SRINAGAR

IT is high time for the Kashmir Government to realise the urgency of enforcing a rational price based on a reasonable margin of profit for all the commodities which have a wide national and international market. Unless this is done, the State's famed carpet industry and also the fast growing hops industry are bound to come to grief sooner than later.

Take the case of carpets. The dealers and the authorities revelled till last year that the wool carpets and silk carpets were fetching a price of up to Rs 300 and Rs 700 per sq ft respectively in the international market. Nobody bothered about the fact that these prices were based on a profit margin of 100 per cent or more. Unconcerned about the repercussions, the traders and the authorities received a rude shock this year with the discovery that the high priced Kashmir carpets had no buyers in the recession hit European markets which had already been stuffed with high quality and low priced silk carpets from China and Turkey and continued to be supplied with better quality wool carpets from Pakistan.

Shaken at the dismal prospect of the State's carpet industry, which was given a big boost to make up for the gap of about Rs 700 crores created in the international market by the fall in production in Iran, the authorities decided to purchase carpets worth Rs 5 crores from the actual producers. But, the problem remained of the price. After prolonged deliberations by an official committee, headed by the state-owned Jammu and Kashmir handicrafts export corporation chief the price was fixed at about Rs 140 per sq ft in the case of wool carpets and up to Rs 280 for various categories of silk carpets. It is presumed that these prices were fixed after allowing a reasonable margin of profit to the weavers. That being so, the fact that the prices that ruled till last year were unreasonably high and were sustained because China had not entered the international market stands established, the moral being that the state's carpet industry employing over two lakh people cannot be left to the mercy of profit-hungry traders who, incidentally, continue to handle at least 90 per cent of the state's carpet exports which were of the order of Rs 25 crores for wool carpets and Rs 7.75 crores for silk carpets in 1980-81.

All those connected with the state's carpet industry would also do better to realise that they were in for stiff competition from within the country. The Badhoi belt in UP, for instance, is reported to have already established a loomage of 35,000. Its produce is stated to account for about 70 per cent of India's total current carpet exports of about Rs 100 crores. It is also stated that the Badhoi weavers have already started producing 16:16 knotted carpets, a feature hitherto unique with Kashmiri weavers. The cost of production, inflated in the case of Kashmir carpets mainly by the wage component, is also less in Badhoi. True, Kashmir weavers remain masters in the production of silk carpets. But, this field is faced with acute raw material problems besides competition from China. However, it is alleged that the Kashmir exporters have been managing to send out silk carpets under the name of wool carpets to corner the 20 per cent subsidy available on the latter against only 10 per cent on the former. While this allegation can be looked into by the authorities concerned, the State Government should ensure that carpet pricing remains rational so that the industry does not face extention.

In the case of hops, the import of which has already been banned by the Government of India and for the production of which Kashmir valley has

Money

Brave new world of banking

BANKS are at cross-roads. Most of the problems they and their customers face are those of a transition period. This is how most bankers defend the state of customer service today. They imply that in due course, when the banks settle down to their present role, the problems will disappear and customer service will improve.

We may examine where this transition should lead us and what is the brave new world of banking that is in store for us. One single area in which some thing new is expected is the job content of a banker's daily tasks.

Banks recruit clerical staff numbering 30,000 every year. They are selected from the best, after tough tests and competition. They are grilled through the most modern selection system. Obviously the selected material is of a very high calibre. Bank jobs pay well, are relatively lighter in burdens, promotion opportunities are early and many, and are very attractive. They attract the best of the clerical talents in the country.

There is no wonder that these people get frustrated as soon as they enter into the banks. Despite their talents and calibre the jobs they have to perform make very few demands on their intelligence or calibre. As clerks they carry no responsibility. There is no obligation on them to do their work correctly and accurately. In fact there is no obligation on them to do any work at all. And in any case, the work that they may do is to post and cast figures, copy them from one book to another.

More than these, the two major shortcomings of their jobs are that they do not have to take any initiatives on their own, and they do not have to understand the significance and implications of the jobs they do. They just do what they do or sometimes have to do, without going into the reference and context of their jobs.

In the brave new world of banking after the transition, all this has to change. The best way to utilise the talented recruits and to get the best out of them, the most effective way to motivate them and to divert their energy towards creative use is to give them responsible jobs and total responsibility for getting results.

In banking industry, the supervision, checking and double control system works against such a goal of giving more responsible and responsive tasks to the clerical cadre. Somebody must do and somebody else must check. Yet in practice no one checks and just signs. Yet bankers cannot get rid of their mentality to use double controls. So much so that some foreign banks actually sign even acknowledgement letters with two signatures!

In the new world of banking there should be only one cadre of doers only and there is no need for two—that of doers and checkers. There is of course the need for accuracy and correctness in all bank's accounts. But it does not follow that the existing checking and supervision system ensures that accuracy and correctness. On the contrary, it discourages both the doer and the checker from performing their tasks. They actually try to pass on the responsibility to each other. On the other hand, self-supervision and responsibility on the same person will ensure that he takes initiatives, does his work, develops talents and resources to do it better and that understands the effects and implications, consequences and results of his actions, duties and tasks.

This is not such an unusual or revolutionary idea as to invite resistance or opposition. There are checks and balances within the accounting system and strategic controls within the management system that would enable a single point responsibility for accuracy and reliability of accounts to be counter checked. And they would give better results than the present 100 per cent checking system where checking is not 100 per cent and responsibility is nil.

S. G. Shah

---

emerged as the only suitable place, thereby, bringing considerable fortunes to the growers, the state government appears to be unreasonable insofar as the procurement price is concerned. A circular issued by the state agriculture ministry to the breweries, which use hops for manufacturing beer, says that the state-owned Agro-industries Corporation has decided to procure green hops at Rs 11 per kg and advises that in no case should the price paid to growers be less than Rs 10.60 per kg, the price announced, interestingly about a fortnight earlier by the Mohan Meakins.

There is no disputing the norm that the growers should receive a remunerative price. But, the authorities need to realise that it cannot be unreasonable to drive the breweries to resort to the use of hop extracts or concentrates, the import of which has not been banned. The scientists at the Regional Research Laboratory here, who pioneered the cultivation of hops in the Kashmir valley, testify that the cost of production per kg does not exceed Rs five. Allowing for a high margin of 50 per cent, the procurement price could be fixed at Rs 7.50 per kg of green hops. That, incidentally, was the price in 1979. It rose to about Rs 10.25 in 1980. A rise of 40 per cent in three years may not appear very high in the prevailing inflationary situation in the country as a whole. But, the fact that the prices are based on more than 100 per cent margin does pose a threat to the future of this newly developed agro-industry.

Because of the exceptionally high returns from the cultivation of hops, more and more areas are bound to come under this crop. In a number of places, farmers have converted paddy fields and apple orchards into hopyards. The trend is bound to continue. The area under this crop this year doubled to 300 hectares as compared with the last year. The production this year is estimated at 2,000 quintals and next year it may go up by another 1,000 quintals. With the country's requirement estimated at about 3,000 quintals, what will state government do when it is faced with production glut? After all, hops are rendered useless within a few hours of being picked. They have to be dried instantaneously. Will the state government rescue the farmers with its total drying capacity of six quintals per shift? What if the brewers and some local entrepreneurs, together accounting for a drying capacity of about 150 quintals per shift, refuse to co-operate in protest against unreasonable procurement price? Will the kilns be taken over? If so, who will operate them? And, can it be done in disregard of the actual user's goodwill? The moral is simple: the price must be remunerative for the grower and reasonable for the user if the industry is to survive.

ENGINEERING

Shortage of raw materials

MADRAS

THE engineering industry is experiencing difficulties in obtaining raw materials such as pig iron, plates and structurals, and the Association of Indian Engineering Industry (AIEI), Southern, Region, highlighted some of these difficulties at a meeting here with the Steel Authority of India Limited (SAIL) representatives. According to AIEI, only two rakes of pig iron reached Madras in the past four months, against 10,000 tonnes last year. What is required is at least one rake load of pig iron for Madras every month, it says.

Low availability of pig iron this year is due to lower production, even though overall steel production has improved this year. Production rate of pig iron has fallen to less than 90,000 tonnes per month against a normal production of 1,20,000 tonnes. Even imports of pig iron under OGL have not improved availability because 40 per cent import duty makes the landed price prohibitive. Yet, there is a proposal to import 1,50,000 to 2,00,000 tonnes of pig iron to meet the shortage.

AIEI representatives asked for a change in the present distribution system of pig iron which is based on the average consumption for three specified years. It suggested instead that allocations be based on the best of the three years consumption. Another lacuna in the distribution system is that while new units are alloted 20 per cent of their licensed capacity, this facility is not automatically available for capacity expansion by old units. AIEI has, therefore, suggested that the present cut-off date, *i.e.* capacities registered up to June 30, 1979, be deleted and allocations permitted on the basis of capacities registered beyond that date also on the basis of additional capacities created in old units.

SAIL representatives also made it clear what they expected of the industry. They pointed out that steel arrivals to the southern region in the last three months averaged 60,000 tonnes per month. Since the basic demand for steel was comparatively lower, the demand did not always constitute movement of a rake load. Industry should, therefore, consider pooling

As I see it

Resettlement of ex-servicemen

THE Government of India has announced reservations of a certain percentage of posts for ex-servicemen. Like many other reservations, the reservation of posts for ex-servicemen also has remained largely on paper. The actual employment of ex-servicemen achieved against reserved vacancies was only 1.3 per cent on the average in Central Government offices and Central public undertakings. There was a shortfall in filling reserved vacancies even in public undertakings under the Ministry of Defence itself. Explaining this failure the Director-General, Resettlement (DGR) referred to the existence of militant trade unions which put pressure on the management to employ dependents of employees and absorb casual labour.

The Ministry of Defence did not bother to preserve the record of the number of ex-servicemen employed in para-military forces, despite the fact that the government departments were called upon to forward quarterly returns to the Director-General, Resettlement, showing the number of ex-servicemen appointed during this period. That was how initially the Ministry of Defence pleaded its inability to produce the record to the Estimates Committee. Subsequently the Committee was informed that statistics had in fact been received by the Director-General, Resettlement in respect of para-military forces except in the case of the Border Security Force (BSF) which had stopped sending returns in 1976.

The Estimates Committee worked during 1980-81. It means that for five years nobody in the Defence Ministry had bothered much about the progress in the resettlement of ex-servicemen. Otherwise the non-reporting by BSF could not have gone unnoticed for so many years.

There was apparently near-total neglect of ex-sailors of the Indian Navy in the recruitment of seamen for the merchant navy, which in five years had taken just 13 ex-naval ratings, notwithstanding the decision taken by the Seamen's Employment Board that ex-naval ratings, who are demobilised after completing their term of service satisfactorily, might be considered for absorption in the merchant navy on merit. The level of employment of ex-Indian Air Force men in the government departments was again very low. Only 0.7 per cent of the retired airmen got jobs in 1977, 1.2 per cent in 1978 and 1.3 per cent in 1979. The low employment of ex-IAF men was all the more remarkable, since airmen in general did not suffer from the disability of not being properly educated, unlike many members of the army.

There is a system of pre-release training of outgoing defence personnel. There are 105 courses for ORs and 24 courses for officers. However, the scheme has been very indifferently implemented. As against the target of training 70,000 defence personnel of all ranks retiring every year, prerelease training was organised for less than 2,900 personnel (400 officers and about 2,500 junior commissioned officers (GCOs) and jawans) during 1979-80. What comes out of these figures is that while 40-45 per cent of the officers get some sort of training before retirement, the number of JCOs and ORs getting such an opportunity does not come to more than 5 per cent of those retiring in the categories.

The Estimates Committee of the Seventh Lok Sabha did not find acceptable the explanation of the Ministry that a sufficient number of ORs were not volunteering to fill up the available vacancies. In fact the Director-General, Resettlement stated that the basic reason for the inadequate response of the ORs was the fact that ORs had to obtain the clearance from their commanders to join training and that such clearance was not freely forthcoming. This fact needs to be considered by the Government as it involves the resettlement of more than 70,000 defence personnel every year.

Subhash Chandra Sarker

BUSINESS OPINION

DR R. R. Hattangadi, chairman, Ion Exchange (India) Ltd : "While until now we have been indirectly concerned with energy, helping in power generation or in saving energy through efficient processes using less power and chemicals ... we shall be directly entering the business of harnessing a form of solar energy especially relevant to India *viz.* through renewable biomass. The first aspect we shall commercialise is by densifying wood waste into briquettes whereby it is possible to produce non-polluting solid fuel with a calorific value of 15,300 kcal/kg, superior to non-coking coal normally sold in India for industrial use. We believe the potential market for such briquettes is enormous in view of the foreseeable shortages of LPG, kerosene and fuel oil.

"The Government should give priority to growing fuelwood on the more than one hundred million acres of denuded land that exist all over India. Fuelwood or energy plantations would supply the fuel needs of the rural populace, 80 per cent of which are now met from existing forests. But forests are required for the essential insurance they provide to agriculture. Growing fuelwood would also create many rural jobs. Since fuelwood can be grown all over India, it need not be transported (over) great distances. The revegetation of all barren land will greatly improve the hydrological balance, as forests act like giant sponges, and enable the productivity of agriculture which is dependent on water to be greatly enhanced.

MR Harishankar Singhania, chairman, J. K. Industries Ltd : "High prices of natural rubber and its shortage is a matter of great concern to the industry. The prices for RMA I grade have touched an all-time high of Rs 1,740 per quintal as against the floor price of Rs 825 per quintal fixed by the Government. Even at these prices, the availability of rubber is poor. It is essential that adequate quantities of natural rubber are imported into the country on a regular basis, not only to meet the gap between supply and demand but also to keep a check on the exhorbitant increase in rubber prices.

"Other raw materials such as synthetic rubber, carbon black and rubber chemicals have also registered sharp price increases. Consequently, selling prices of tyres had to be increased though not to the full extent."

MR M. D. Dalal, chairman, The Hindustan Commercial Bank Ltd : "During the first half of the year 1980 the banking industry suffered a setback due to economic situation which continued to be constrained by droughts in different parts of the country, continuing infrastructure problems like shortfall in power, coal, steel and cement and difficulties in transportation. However, from the middle of 1980 the economy was able to recover because of prospects of bumper harvest in the current year and the series of measures taken by the Government to improve industrial production and promote exports. Inflationary pressures remained strong in the first two quarters of 1980, but decelerated significantly later on. Expansion of money supply was kept under control through judicious monetary and credit policy by the Government. This adversely affected the banking system in India. Aggregate deposits with scheduled commercial banks registered a lower growth at 14.9 per cent in 1980 as against 18.5 per cent in 1979. Similarly, bank credit to commercial sector was also lower at 13 per cent as against 14.7 per cent in 1979."

---

their requirements to constitute a 'customer rake'. If plates were required in small quantities, allocations could be made against other stockyards in the region. They also emphasised the need for closer co-ordination between SAIL and allottees, so that for bulk allotments, materials could be moved from wagons direct on to trucks. Co-ordinated delivery would reduce steel arrivals at stockyards and minimise stocking problems. At the meeting a time-bound programme of refunds by SAIL was agreed to. The engineering industry was also asked to make realistic projections of steel requirements well in advance.

AIEI, Southern Region, also organised meetings at Hyderabad and Bangalore this month to consider the scope for increasing engineering exports to Hungary. Products identified for export to Hungary, were : air and gas compressors, springs for automobiles and railways, machine tools, bulb and lamp components, components of automotive engines—piston assemblies, cylinder liners, gaskets, steel forgings, power station equipment—seamless steel tubes, boiler feed pumps, gear grinding machines, thread grinding machines, numerically controlled special purpose machine tools, NC machine centres, telecommunications equipment and measuring instruments.

India has a growing adverse balance of trade with Hungary that needs to be corrected. Industrial co-operation between the two countries is substantial there being 23 joint ventures already in operation. Engineering industries here are keen on identifying more areas of possible collaboration between the two countries.

Dollar to strengthen?

CHICAGO

THE passage of the Reagan economic proposals is held as the most important economic legislation to pass Congress since the Second World War. The taxation and budget ideas will change the earning, spending and investing habits of Americans. The change will be slow at first but will accelerate in 1982 and 1983. By 1985, income tax will be indexed to inflation correcting what is known as bracket creep/processed by which individuals get into higher marginal income tax bracket wth higher nominal but unchanged real income. Although proposals of the economic programme are novel and untried, it is not difficult to judge the impact of the programme on inflation, interest rates and value of the dollar in the foreign exchange market.

As regards inflation, the rate of price increase has slowed significantly in the first seven months of this year. The producer price index has grown modestly while the consumer price index has grown at 9.6 per cent year on year. The widest measure of the change in prices, the GNP deflator grew at a modest 6.6 per cent in the second quarter composed to 9.6 per cent in the first. CPI would have grown slowly if the mortgage rates had not risen along with the general level of interest.

The outlook for inflation is towards further improvement as earlier declines in commodities as well as oil prices may influence producer prices for some time to come. However, the future is not as bright as the recent past. The Fed will be expanding the reserve and the money supply soon. The expansionary impact of the just passed tax cuts will be felt exactly at the time as the money supply begins to grow. If the economy does not have significant excess capacity at that time, inflationary forces will gather speed.

Interest rates will have a very rocky ride. Decline in interest rates may occur sooner than expected but may be very shortlived. Recent level of inflation does not justify present level of interest rates. However, the interest rates as such are not reflecting the inflation factor. Demand and supply of credit will become much more tightly balanced than it is at present. With the government borrowing needs exceeding 33 billion dollars in the fourth quarter and private demand for long-term credit unfulfilled during present high interest rate regime, long-term interest rates are not expected to decline. Even short term interests rates may experience some upward push as the money supply expands. Therefore, the course of interest rates will possibly decline at first and then an increase.

As regard foreign exchange much depends on what the market focuses on. If the attention remains focussed on interest rate differentials as well as the current accounts, dollar may continue to be strong for the balance of the year. However, the recent strength has already sown the seeds of ultimate future weakness. Trade account will deteriorate perhaps significantly. If high interest rates do not attract sufficient inflows of funds, current account could turn negative next year. If interest rates decline at the same time, dollar could come in for real trouble. The most likely scenario is for the dollar to strengthen between now and the end of first quarter of next year and then to weaken for a period of six months or so.

Recent trends in public finance

Readings in Indian Public Finance

Edited by D. N. Dwivedi

Chanakya Publications, Delhi, 1981; *Pages* 264; *Price Rs* 70.

Fiscal measures have become the instrument of development finance in India. Our policy makers have been using fiscal policy consciously and consistently to meet various goals like creation of employment and rapid economic growth. Large public sector investments are being made in order to break the vicious circle of poverty. The Indian tax system is devised to co-ordinate revenue function and regulatory functions of the taxation with view to promoting growth with stability, reduce inequalities of income and wealth and prevent any further concentration of economic power Devoid of its philosophical idealism, in reality, the structure of Indian public finance has grown up haphazardly, influenced by historical factors and political vested interests with an agricultural bias, as tax burden on the non-agricultural sector has continuously increased, keeping agricultural sector relatively much undertaxed. The subject of agricultural taxation in India has raised a very controversial debate. The 'Under Taxation thesis' has been refuted by Prof. Lipton by proving that agriculture in India is overtaxed. Similarly Prof Raj Krishna challenges the 'intersectoral inequity thesis' of taxing agricultural sector. (p. 15). Other important issues of Indian public finance are the problem of direct *vs* indirect taxation, black money and Centre-state financial relations.

Intricate as the subject of Indian public finance is there is always scope for a good analytical work which can grapple with the current issues. The book under review is a compilation of some of the most important contributions to the study of Indian fiscal system by the country's eminent economists like Chelliah, Gulati, K. N. Raj, Raj Krishna, etc.

The book contains 11 research papers, and writings on the subject which had appeared earlier in journals like *Indian Economic Review, Arthvijnana,* and *Economic and Political Weekly.* It begins with 'An over view of India's fiscal policy' by the editor which is followed by K. N. Raj's paper on 'Direct taxation of Agriculture' where the author has examined the pros and cons of the agricultural holdings tax. The third article is on 'Intersectoral Equity and Agricultural Taxation in India' by Raj Krishna, in which the author has refuted the inter-sector equity thesis for additional agricultural taxation in India and argued that there is no convincing general case for heavier taxation of agriculture in the country. The present reviewer, however, is not in agreement with this view, as the inferences are made on the basis of chosen premises and there is no reason why rich farmers' income should go undertaxed.

The next article on 'The incidence of Indirect Taxation in India' by Dr Chelliah and Lal is a classic one on applied economics of modern incidence theory in the context of Indian tax system. The fifth article is by the editor Dwivedi on 'A buoyancy approach to the evaluation of excise taxation in India', a reprint form *Indian Economic Review,* which is followed by M. C. Purohit's paper on 'Buoyancy and Income-Elasticity of State Taxes in India' where the author seeks to examine the determinants of tax revenue explaining the variations in tax field. It has been observed that direct taxes on farm sector are inelastic while commodity taxes are more elastic. Further, development of state has a bearing on the income elasticy of taxes and revenue receipts.

Then there is an article 'On Black Money' by Sundaram and Pandit, in which the authors have pleaded for the elimination of controls that would convert black income into white, apart from the need for efficiently administered co-ordinated tax enforcement by the Government.

Then the editor has included an article by I. S. Gulati and A. Bagchi on 'A proposal for Reforming Corporation Tax.' in which the authors have suggested substituting .company taxation by the cost base in place of the present profit base. It is followed by the inclusion of some relevant excerpts on 'Value Added Tax' from the Report of the Indirect Taxation Enquiry Committee (1977) entitled as 'Long Term Reform of India's Indirect Tax Structure.'

The next paper 'On Deficit Financing' by D. S. Swamy has its own merit of presenting a static and a dynamic macro-economic model to prove that the proportion of budget deficit financed by money creation is a crucial determinant of the rate of price inflation. Last but not the least, Prof Raj Krishna's note of dissent to the Report of the Seventh Finance Commission has been included by the editor.

Evidently, the various papers compiled by Dr Dwivedi cover adequately recent trends in the literature on Indian public finance. No doubt, this volume will prove to be a useful reading to the serious students of public finance, as well as to the policy makers.

D. M. Mithani

In Brief

India-US Business Council

(*Sixth Annual Meeting*), *Brochure published by US-India Enterprises, P.O. Box* 10175, *Towson, Maryland* 21204, *USA; Price* $3.

US-India Enterprises, of which Mr Hasmukh Shah is the president, brought out this attractive brochure on the occasion of the sixth annual meeting of the India-US Business Council held in Washington on June 22-24. As Mr Shah has said the United States of America is India's largest trading partner and ranks among India's leading suppliers and is, in turn, the leading world market for India's exports. The India-US Business Council's meetings have thus a significance of their own for the council has been formed specifically with a view to promoting trade between the two countries and developing better economic relations. This short souvenir (brought out in co-operation with *Embassy News,)* carries a message by Mr K. R. Narayanan, Ambassador of India, who refers to the immense potential for increased trade between India and the USA, a trade which had already reached a figure of $2.6 billion in 1980. However, as Mr Narayanan points out India had an adverse balance of trade of $600 million, which suggests that the Business Council will have to explore ways to increase India's exports to the USA. The souvenir carries articles by distinguished Indians and Americans including Mr Orville Freeman, Mr Arvind N. Lalbhai, Dr Bharat Ram, Mr H. S. Singhania, Mr Kantikumar R. Podar, Dr Freddie F. Mehta and Mr Prakash Shah, who is the vice president of the American Express Bank.

Data Bank Series, May 1981

Man-Made Textiles Research Foundation, Resham Bhavan, 78, Veer Nariman Road, Bombay 400 020; printed pages 23; Price not quoted.

The May 1981 issue of *Data Bank Series* brought out by Man-Made Textiles Research Foundation provide data on the developments in the man-made fibre industry at home and abroad, exports, imports and prices in a capsulized form. Those who are associated with the industry will find this service of immense use.

Top, Topless & Top-heavy

by V. V. Raman

Published by Young Man & Co., 888 Nai Sarak, New Delhi 110006. Paper Bound Rs 12.50.

The publisher's blurb glibly states that it is a witty but vibrant book, a tearing probe into the three styles of management named in its title according to their cult, culture, and business behaviour.

It claims to be a breezy satire, but unfortunately it seems to have fallen flat on the reviewer.

"Economy measures are to be emulated first by the top echelons to have any impact on the organisation. If parents are prodigal, how can they check on their poor children?" is a sample of the so-called pithy sayings.

The saving grace of the book is cartoons on every page, double the size of the reading matter.

Feroze Wadia

A provocative analysis

IN a review article *World Food Programme News* says that a recently published book, *Food for war—food for peace: United States food aid in a global context,* by Mitchell B. Wallerstein (Cambridge, Massachusetts, MIT Press 1980) is likely to be of great interest to those concerned with food aid. The giving and receiving of food aid result from a closely interwoven latticework of considerations, motives and decisions within and among donor and developing countries. How food aid has evolved into a significant form of development assistance is a complex subject, requiring a careful examination of all the elements within its framework. This is what Dr Wallerstein has endeavoured to do. As he points out, "although much had been written on the general issue of food aid, no comprehensive analysis had been conducted regarding the political considerations, interests and objectives that have shaped global food assistance efforts, since World War II. This study attempts to fill that gap."

"The book examines the evolution of United States food aid, describes the activities of other bilateral and multilateral food-aid programmes, analyses the foreign policy objectives of United States food aid between 1961 and 1976 and finally presents the arguments both for and against a greater multilateral channelling of food aid through the United Nations system.

"Understandably, much of the book concentrates on the evolution of United States food-aid policies and programmes. Although it makes reference to the food-aid programmes of Canada, Australia, Japan, the United Kingdom, France, the Federal Republic of Germany, Denmark, Sweden, Norway, Switzerland, Italy, Belgium, the Netherlands and the European Economic Community in the context of the book's central theme, these are necessarily briefly described. For those interested in the origins and evolution of multilateral food aid, there is an interesting chapter on the World Food Programme which contains an intriguing account of the interplay of forces that led to its establishment.

"In a book which attempts to cover such a wide spectrum, there are strengths and weaknesses in coverage and analysis. More might have been said about the comparative advantages and disadvantages of different forms of food assistance, particularly bulk-supply, programme-type food aid as provided bilaterally and project food-aid as employed by the World Food Programme. The effects of food aid used in combination with other types of development assistance — financial, technical and material—might also have been touched upon.

"Where data on food aid are given in current prices, they mask the considerable erosive effects of commodity and freight price rises on the real value of this type of assistance. Another shortcoming, recognised by the author, is that several important developments have taken place since the book entered into production which potentially can have a significant impact on food aid generally. Among them are approval by WFP's governing body, the Committee on Food Aid Policies and Programmes (CFA), of guidelines and criteria for all food aid, assessment by the CFA of food-aid requirements in the 1980s and the coming into force in 1980 of a new Food Aid Convention which establishes a higher guaranteed level of 7.6 million tonnes of food commodities.

"The author emphasises that the study concentrates on the donor side of the aid relationship. Another study is needed of food aid seen from the perspective of the recipient countries. This is particularly important. On the threshod of the 1980s, as the coalescing crises of food, energy and money supply begin to take effect, it is critical to determine how food aid can best be used to stimulate development, not dependence, in the developing countries."

BEL ENTERS LSI ERA IN ICs

Computer-aided design, microlithography, and Ion Implantation, Metal and Silicon gate technology
-leading to large scale integration.

Soon, BEL will bring you LOVAG, C^2L, and SOS ICs.

Since BEL pioneered commercial production of ICs in this country, the technology has become more advanced. ICs have now become more complex and much smaller in size. Thanks to the computer-aided design and other modern facilities, BEL could easily transcend to the new innovations in IC technology.

The new generation of IC technology calls for more sophisticated techniques and testing parameters. BEL has now equipped itself with sophisticated facilities such as microlithography and Ion Implantation – which will enable BEL to produce microprocessors and other large scale ICs. And BEL has the capability to provide the most critical component for digital watches, the LSIs.

With these latest additions to bipolar and CMOS ICs, BEL is in the process of enlarging its current product range in ICs. At several stages of development are: BEL 7000 AM/FM radio IC, designed to give 1 watt power at 6V; type BEL 7001 for tape recorder applications, telephone dialler IC and PCM CODEC ICs and a number of new generation ICs.

The driving force behind BEL's leadership thrust has been its components capability. BEL's unique in-depth expertise in IC technology is only too well matched by its achievements in other component areas: receiving valves, transmitting tubes, X-ray tubes, cathode ray tubes, TV picture tubes, microwave tubes, passive vacuum devices, display devices, hybrid microcircuits, printed circuit boards, precision crystal filters and ceramic capacitors.

These technological triumphs notwithstanding, it is BEL's state-of-the-art systems capability, as evidenced by its sophisticated systems and equipment that keeps India on the electronics map of the world.

ONGC's second offshore drilling rig Sagar Vikas.

(On main cover : A view of BHN platform)

Exploring for oil and gas

By **P. T. VENUGOPAL**

TWENTYFIVE years ago, the Oil and Natural Gas Commission comprising then of a part-time chairman. Mr K. D. Malaviya, and two full time members, Mr A. M. N. Ghosh and Mr A. C. Bose, met at Dehradun for the first meeting of the Commission. At that time, except for some exploration efforts in progress in West Bengal under an Indo-Stanvac project and a degree of exploration and exploitation for hydrocarbons in the north eastern corner of Assam by Assam Oil Company, the entire country was practically a virgin land so far as prospecting for hydrocarbons was concerned. The sedimentary basins on land cover an area of one million square kilometres, a vast expanse encompassing forests, marshes, deserts, mountains and plains.

Initially an aero-magnetic survey covering a part of Rajasthan and Punjab and the entire Ganga Valley was conducted. Then geological field parties were deployed for mapping of Punjab and present day Himachal foothills UP foothills, Rajasthan and Kutch. Seismic survey parties soon followed in Cambay basin, Rajasthan and Assam the work being handed by ONGC personnel, supplemented by an Indo-Soviet seismic party working in Punjab.

Data of the subsurface was acquired, interpreted and the first well was spudded in 1957 at Jawalamukhi. Gas was struck in this well in May 1958 but not in commercial quantities. The next wells were drilled at Cambay (Gujarat) and Disangmukh (Assam). At Cambay oil was struck in September 1958. Assam and Gujarat became the first two states to yield commercial hydrocarbons and even today all the on-land fields lie in these two states except for a small field in Nagaland which went into production in the last few months. ONGC's onshore fields currently give an output of five and a half million tonnes per year. There is an additional production of almost three million tonnes from Oil India fields in Assam.

Discovered reserves

In the last seven or eight years, the offshore has come into the forefront. The Bombay High field where oil was discovered in February 1974, in oil parlance is a 'giant' field. Today the field produces at the rate of eight million tonnes per year and this rate will go up as further development progresses. There have been many other discoveries in the offshore following Bombay High.

As on January 1, 1981, a study carried out by ONGC's Reserves Estimate Committee places the initial oil in place in ONGC's fields at 2,463 million tonnes and gas in place at 840 billion cubic metres. Of these the share of offshore is 1,772 million tonnes of oil and 740 billion cubic metres of gas. At this point, a word of caution is called for. It is only a small part of the oil in place that can be won for commercial production. A larger part of gas in place is, however, recoverable. It is estimated that the balance of recoverable oil, by primary recovery, is 328 million tonnes from offshore and 102 million tonnes from on-land. For gas, the figures are 329 billion cubic metres and 26 billion cubic metres respectively. At current international prices, the recoverable gas and oil as above has a value of 120,000 crores of rupees. The proportion of oil that can be recovered can be raised by secondary recovery techniques. Research and experimentation on these have been taken up. The exact technique to be applied will differ from field to field. It is to be added that oil or gas can only be produced from a field, gradually, spread over a number of years. Maximum efficiency rates for withdrawal should in no circumstances be exceeded

Mr P. T. Venugopal
Chairman,
Oil and Natural Gas Commission

It is thus extremely rewarding to search for oil and gas. There is much work to be done in this country before it can be said that all that can be discovered has been discovered. Accordingly the ONGC has been drawing a ten year perspective plan for exploration in the current decade. It shows that even in Gujarat and Assam, which are producing zones 216 and 490 exploratory wells respectively are required to be drilled. In the offshore, a minimum 200 exploratory wells have to be drilled. Then there are the numerous sedimentary basins on-land where drilling has so far not produced results, but the drilling density has not been adequate and so more drilling is required.

Results come faster from the offshore. Here in view of no land having to be acquired or right of way secured or no approach roads having to be built, all processes proceed speedily. Rigs for drilling are always in ready position to drill on drillships or barges which move with ease from location to location, whereas on land the rigs have to be moved in parts, assembled, dismantled and so on. Nevertheless, on land work has to be given as much importance as offshore work. Every litre of oil and every cubic metre of gas is valuable wherever it occurs.

Areawise strategy

In what follows an attempt is made to outline the exploration strategies being adopted in some of the areas of the country. The list, however, is not exhaustive.

Gujarat: So far, exploration has been confined to relatively shallow depths in the Cambay basin. The plan now is to take up deeper prospects also. The discovery of gas at Dahej at deeper levels has opened up a new vista. Incidentally, exploration will be taken into the older rocks of Mesozoic age. The northern part of Gujarat also holds promises.

Assam and other N. E. States: Exploratory drilling is being mostly carried out in Brahmaputra valley and Tripura and more will be done. Some drilling has also been carried out in Cachar, Meghalaya and Nagaland and more drilling is planned. It is also intended to go into new areas like Dhansri valley, Naga thrust zone and some of the folded anticlines of Tripura. Elsewhere, as in Mizoram and Arunachal Pradesh, geological mapping will be continued.

West Bengal: Several wells have been drilled in the past but there has been no discovery. Two wells are now under drilling. Wells in the past were located on 'structures' delineated by seismic surveys. A new approach now being pursued is to search for sand bodies in the extension of ancient deltas under the sea before its receded to its present shore line. In the Sunderbans area, seismic survey work using a shallow draft barge has recently been completed and the data are under processing.

Andhra Pradesh : Wells are under drilling at Narsapur-2 and Razole. Gas was met with in the well drilled at Narsapur. More wells are being taken up for drilling.

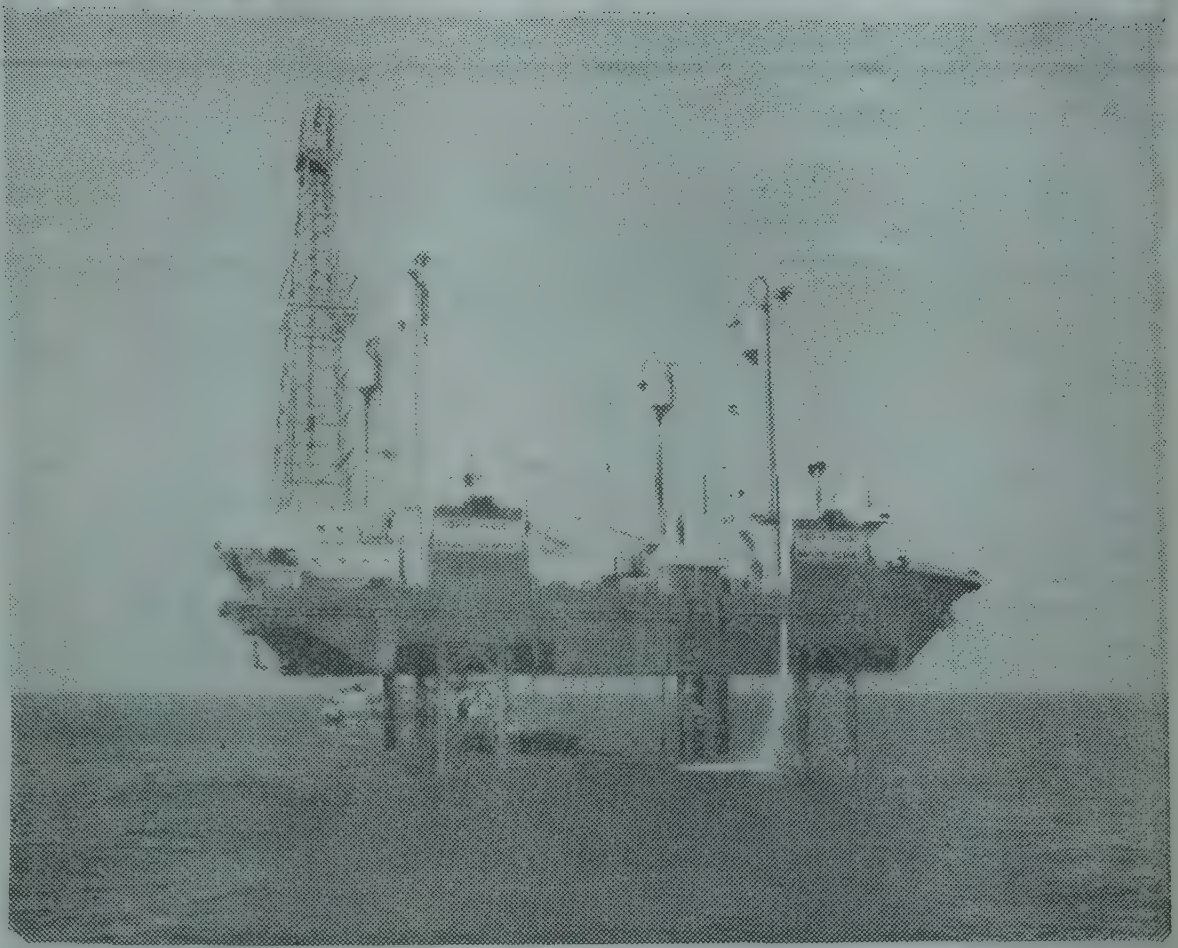
Tamil Nadu: Although several wells were drilled in the past, except for a show of oil and gas near Karaikkal and Madanam respectively, there was no worthwhile find. In the new strategy, search is being carried on by seismic parties for structures in older rocks of Mesozoic age. In due course it is the intention to resume drilling on interesting structures as are discovered.

Rajasthan: Here also, several wells have been drilled in the desert of Jaisalmer but except for a small gas find at shallow depths, the wells were dry. In the new strategy seismic parties will map structures at deeper levels including older rocks of Mesozoic age. Driling is to be resumed in due course.

North Western Himalayan foothill: This area falling in J & K, Himachal Pradesh and Uttar Pradesh has a complex geology. Simpler seismic methods of delineating structures at deep depths of 5,000 to 6,000 metres have not given precise results. Towards the later part of 1981, a special telemetric seismic survey, using a foreign contractor, will be taken up in an endeavour to locate new prospects for drilling.

Ganga Valley: This refers to the plains of UP and North Bihar. Wells drilled so far have been dry. However, some interesting geological leads have been found and these are being followed up by seismic surveys in the first instance.

Offshore: The importance of Bombay High is widely known. South Bassein gas field is another 'giant' with a vast reservoir of non-associate gas. There are a number of satellite fields which have been discovered on the west coast. On the east coast, oil or gas has been met with in three structures, in different geologic basins. The potentialities of these are under assessment. The pace of exploratory work is being stepped up by the acquisition of more mobile rigs, either to be owned or hired. The sedimentary area of the continental shelf is 400,000 square kilometres and it is here where most work has so far been done. An equal area lies within the continental slope (beyond the continental shelf). Work will be extended into this area, first by undertaking systematic seismic survey and then by drilling prospects as are thrown up.



Sagar Samrat, the first drilling rig of ONGC.

The new oil and gas finds to come are likely to be in more complex and subtle geological environments. This would call for newer approaches in exploration, use of highly sophisticated instruments and integration of data obtained by different techniques. Towards this end, ONGC has updated its seismic instruments, logging equipment, well testing gear, data processing paraphernalia and laboratory equipment. The scientific and technical personnel keep their knowledge up-to-date and acquire new skills. Three research institutes for petroleum exploration, drilling technology and reservoir studies provide due support to field work. In the offshore, a research division is being organised to take up studies on various problems and to find solutions. All the research units will draw fully on support resources available in the universities and allied research establishments.

An often asked question is whether and when this country will attain self-sufficiency in oil. Today indigenous oil meets a little over 45 per cent of the demand and this percentage will increase perhaps to 60 in three or four years. Beyond that it is difficult to hazard any guess. Secondary recovery techniques would add to the amount of recoverable oil as time goes by. New fields would be discovered and these too will help to add to the available hydrocarbon stock. But, it should be remembered that oil is a non-renewable source of energy. While it is there, it should be used with best advantage. We have an abundant availability of natural gas. This again is a commodity which should be used judiciously. These are considerations which are of national importance. ONGC's task is to find all the oil and gas that there is.

For long, oil was myth in India...

The eternal flame at Jwalamukhi, the mysterious bubbles in a pond in Gujarat . . . for ages, oil and natural gas were only myth in India. But today, ONGC's efforts have turned this myth into a living legend, a striking reality!

ONGC completes 25 silver years of striking black gold. Eventful years in which it has not only boosted indigenous oil production, but has also brightened the prospects of finding more oil; brought in a new ray of hope. It has emerged as one of the few fully integrated oil companies in the world, engaged in all aspects of oil exploration, drilling and production—on-shore and off-shore. As a technologically self-sufficient company that possesses the expertise and experience to explore for oil in the most diverse geographical conditions. And, as a profitable public sector enterprise in India, dedicated to self-sufficiency in oil.

ONGC's performance to-date has been comparable with the best in the world. It has already produced over 82 million tonnes of crude oil and over 8245 million cu.m. of gas. During the next 5 years, it plans to produce over 63 million tonnes of crude oil from off-shore and over 27 million tonnes from on-shore. This will mean a further foreign exchange saving of over Rs. 16,000 crores at the current world market price.

ONGC also envisages a 7-fold increase in gas availability—from over 2.7 million cu.m. per day in 1981 to over 12.6 million cu.m. per day in 1985. As ONGC's LPG plant at Uran has been commissioned, there'll be a significant increase in the supply of cooking gas.

An even more significant aspect of ONGC's growth is the reservoir of talents it has built up. A dedicated team of over 28000 men including some of the country's top-most scientists, engineers, geologists and geophysicists. Men who have telescoped over a century of expertise in the field into this brief span of twenty five years.

Today, the silvery past is guiding ONGC to a golden future as it continues its all-out efforts to find more oil—living up to the faith the nation has in its ability.

Today, it's a striking reality!

A silvery past—a golden future

1980-85: The years of promise

THE Oil & Natural Gas Commission, which acts as the standard bearer for exploration and exploitation of oil and gas reserves of India, was set up in 1956, and later converted into a statutory corporation.

It has a chequered history. Starting with a slim production of 0.04 million tonnes in 1961-62, it produced 8.93 million tonnes during 1980-81. In its short career, it made an important discovery in identifying Cambay basin, which besides the well known areas extends into the offshore, where it has been better known as Bombay High.

And Bombay High is another name for a success story - a story of a fast find to fruition.

The Bombay High and adjacent areas are slated to produce in the five years 1980-85. more than 63 million tonnes per annum of crude oil, 9,736 mmm^3 of gas in addition to 13 million tonnes of LPG.

Besides the increases in production from offshore areas, plans are afoot to improve it in onshore areas as well. Thus the overall production of crude oil at 8.93 million tonnes in the year 1980-81 is planned to be raised to 24.92 million tonnes in the year 1984-85.

The industry is capital intensive; development of an oil field even after its discovery is a time consuming process. The discovery itself comes after sustained efforts over a long period. And, therefore, the key phrase in ONGC is long range accelerated planning.

Search for oil begins with geological surveys, followed by geophysical surveys; then comes exploratory drilling. In case where we are lucky, development drilling follows. Luck has been very much with ONGC of late; for it follows those that have a vision and mission, those that strive hard to make dreams realities.

In the Sixth Plan period (1980-85) geological parties are being strengthened, provided with sophisticated equipment; and trained in more modern techniques. Besides, rechecking on earlier covered areas, new areas are getting increased attention. More important amongst them are shallow areas in the Gulf of Cambay, Sanchor, Barmer Basin, Dhansiri Valley, North Bank of Brahmaputra, Naga Hills, Sunderbans in onshore areas, and Krishna, Godavari and Andamans continental shelf, the R-12, B-37, B-38 structures, in offshore areas. For undertaking geophysical surveys in certain areas like Himalayan foothills, West Bengal and in Tripura foreign parties will be associated to expedite these surveys and transfer their latest technology, techniques and practices. Further, depending upon our need for early surveys in offshore areas, we intend to employ contractor vessels in addition to our own survey with '*Anweshak*'.

By V. RAMANUJACHARI
Member (Finance), ONGC.

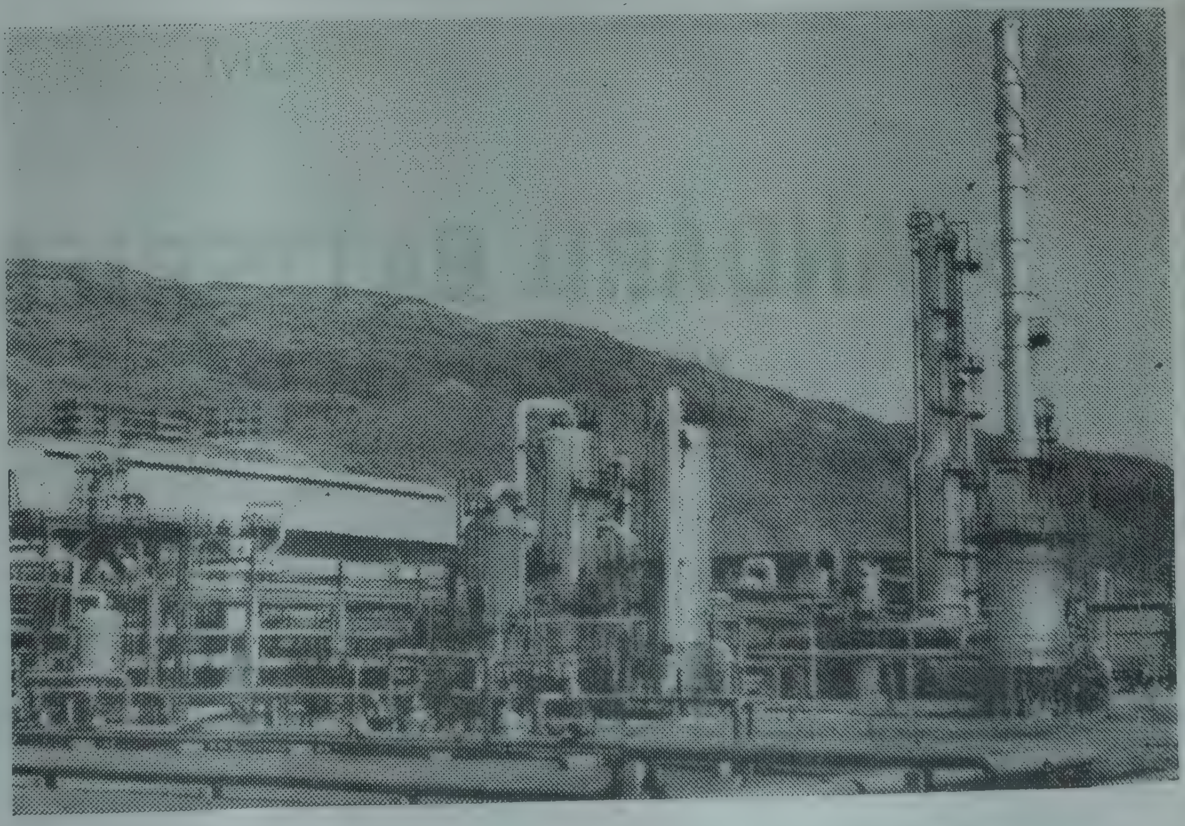
The data thrown up by these geophysical surveys requires most careful interpretation. Over these 25 years, ONGC has developed high skills in this field. Their scientists vie with the best. They are exposed to new practices/technology by encouraging association with international forums and organisations in this field. The Institute of Petroleum Exporation with its own prestigeous computer centre, is well staffed as also well equipped. So will be the other two Institutes of Drilling Technology and Reservoir Studies.

The drilling efforts planned during the five years period are of the order of 566 wells in the onshore and 323 wells in the offshore using 204 and 39.3 rig years respectively. The number of drilling rigs on onshore will increase from 33 in 1980-81 to 48 in 1984-85 and the number of rigs utilised will increase considerably in the offshore as well.

Exploratory drilling on onshore areas will be in Rajasthan, Cambay Basin, N.W. Himalayas, eastern part of the country, and in areas around Ganga delta, Krishna-Godavari delta and Cauvery basin areas. In the offshore, the major thrust will be the western continental shelf, the Bassein B-38 trend, the Ratnagiri shelf and on the east coast, the basins of Krishna-Godavari, Cauvery, the Andaman offshore. This sort of thrust begets oil.

These exploratory efforts are expected to lead to a discovery of about 700 million tonnes of in-place geological hydrocarbons (oil and oil equivalent of gas) or 165 million tonnes of recoverable reserves of hydrocarbon.

The crude oil production will very nearly treble in 1984-85 as compared with 1980-81. These additional quantities do not drop like manna from heaven; they surge from deep within; from new fields or by enhancing recovery from existing ones. For the latter, reservoir behaviour needs to be studied carefully, suitable techniques used to make the fields better. It is here that the role of the Institute for Reservoir Studies becomes very significant.



The LPG (liquified petroleum gas) plant at Uran, near Bombay.

Production of crude oil is of primary significance but there is rightly an enhanced emphasis on the production of gas. Its use as feed stock for fertilisers, as base for many chemical industries, besides its earlier common place use as fuel has been adding steadily to its reputation as an up and coming money spinner and a valuable industrial input The sources of gas production are two-fold-associated which comes up alongwith crude oil and is separated later, and free which comes from gas fields unmixed with crude oil. During 1980-85 period output will be raised from 1,018 mmm^3 in 1980 to 4,423 mmm^3 in 1985. Also based on offshore gas, a liquified petroleum gas plant which will produce 1,70,000 tonnes, has come up in Uran. Turn towards Uran; that is where the light is.

This build up of capabilities to meet these soaring targets will need not only the utmost human effort, the best of managerial talent. It also needs the most meticulous planning. The prospective fields are unique like human being; no set pattern repeat itself; situations are widely divergent making challenges complex and different. Technological advances in this industry are coming even faster than in most; obsolescence is therefore high. The depleting nature of each field compels that before one runs out, another should be found to replace it to maintain production at a given level. But to keep running to stay where one is, spells medicority; one has to set up a faster pace.

Bombay offshore is where the fast action is. And no wonder. From 4.75 million tonnes in 1980-81, production will make a speculative leap to over 19 million in 1984-85. LPG production will increase from almost scratch to 2,08,000 tonnes; and gas from 293 mmm^3 to 2,914 mmm^3 in 1984-85.

Apart from the revenue expenditure to raise above indicated quantities of crude oil, gas and LPG, an investment of Rs 4,787 crores will be required during the five years 1980-85. Of this amount, the internal resources of the company will provide Rs 4,537 crores, thus leaving a very marginal requirement of Rs 250 crores to be found from external sources.

This very substantial internal generation of money resources in the period 1980-85 is after paying huge chunks of money to both the Central Government and state governments as royalty and taxes. The payments to the Government of India during 1980-85 by way of royalty and cess will be Rs 1,420 crores as tax on our income of Rs 3,500 crores and a dividend Rs 101 crores. Also during these five years payments to various governments by way of royalty on gas and sales-tax would aggregate to Rs 270 crores.

All this means a giant leap forward.

The sights are set on the stars, even as one soars towards these high targets, one cannot lose sight of the human resources that makes these expectations attainable—and worthwhile. Establishing goal congruence, development of each individual, improving the educational facilities for stretching the horizons of knowledge, provision of medical facilities, easing problems of accommodation; enabling employees to infuse a richer content to the quality of life, raising significantly their contribution to the social fabric, helping them in their pursuit of perfection is getting increasing attention.

Computer centre at Dehra Dun.

THE Oil & Natural Gas Commission is engaged in the work of exploration, drilling and production of crude oil and natural gas in India and abroad. ONGC requires specialised and sophisticated equipment and material for its operations in onshore and offshore areas. The quantum of imports of materials and services amounting to Rs 910 crores during the year 1980-81 gives clear idea about the vast opportunities that exist for indigenous industry. They can play a vital role by taking up import substitution work falling within the sphere of their expertise and thus provide the much needed support to the efforts of development of oil resources in the country.

The ONGC has all along been aware of the serious implications of dependence on foreign sources for the supply of equipment/spare parts and sub assemblies in a critical industry like oil. Accordingly in the year 1962 it set up a 'Design & Manufacturing Unit' within the then Directorate of Mechanical Engineering, mainly for developing spare parts and consumables of mechanical engineering nature. This unit was subsequently renamed as Import Substitution Group which is now a part of Materials Management Organisation of ONGC and has expanded its activities to cover indigenisation of complete equipment and assemblies required for onshore and offshore activities of the Commission.

Since the oil industry is comparatively new to our country, indigenous manufacturers are not quite aware of the application and technicalities involved in the manufacture of various equipment, materials and services required. The exhibitions on import substitution set up at Dehra Dun, Calcutta and Baroda display and highlight some of these and serve to create the required awareness amongst the visiting entrepreneurs. Representative samples of various consumables requiring indigenous development are placed in these exhibitions to give an idea of the wide range of items required. The data about the commercial potential are also depicted side by side. In case of bigger items, the indigenous replacements have to fit in the available space and match performance levels of imported equipment, which have been depicted in the forms of graphs, charts and photographs.

The import substitution programme of the ONGC offers new opportunities to Indian manufacturers to participate in the indigenous development of various types of equipment, spares and subassemblies. The manufacturers are registered under the import substitution programme after the capacity and capability of manufacturers for our indigenous development programme under a particular category of items has been verified. Tender enquiries are sent only to those manufacturers who are registered for the particular category of jobs and as such the competition is limited and that too with genuine parties. Development tenders are invited for consumables which may be backed by commercial batch orders. Manufacturers have option to absorb the development cost in samples and/or economical batch supplies or carry forward the same for gradual recovery from future supplies

The manufacturers who are in a position to develop an item for the first time, can be given long term rate contracts to meet the requirements of all projects of the ONGC. The Import Substitution Group provides technical guidance to the intending manufacturers at different stages by providing write-ups, drawings, specifications, test codes and also arranges for stage inspection wherever necessary, so as to reduce the possibility of rejection of the product at final stages. A feed back on the performance of the product is provided to the manufacturers to help them to incorporate improvements so as to bring the product to the desired standard.

Manufacturers are thus given an opportunity to develop their expertise in association with the Commission, in the hitherto almost unknown field of manufacture of equipment, spares and assemblies for oil exploration and production industry. As a matter of fact, some of the manufacturers who started by developing certain items under import substitution programme of ONGC have already bagged export orders. Import substitution programme may, therefore, be looked upon as a gate-

WE COMPLIMENT

OIL AND NATURAL GAS COMMISSION
FOR PIONEERING EFFORTS
IN INDIGENISATION

WE HAVE CONTRIBUTED OUR MITE WITH
KIRLOSKAR CUMMINS ENGINES

A FEW ARE :

1. N-495-P ENGINE	FOR WASHING UNIT
2. N-743-B ENGINE	FOR C-100 RUSSIAN BACKENITE RIG
3. N-743-P ENGINE	FOR DUPLEX 9T RUSSIAN CEMENTING PUMP
4. N-743-B ENGINE	FOR KRAZ 214 TRUCKS
5. TWIN NT-743-P POWER PACK	FOR 3D & 5D RUSSIAN DRILLING RIGS
6. NT-855-P POWER PACK	FOR T-50-P-50 ROMANIAN WORKOVER RIGS
7. KTA-2300-P POWER PACK	FOR ROMANIAN 3DH DRILLING RIG

— OUR ENGINES HAVE DONE DUTIES FOR LAKHS OF HOURS

— WE OFFER REPOWERS FROM 60 HP TO 1600 HP IN AUTOMOTIVE, CONSTRUCTION, GENERATOR, INDUSTRIAL, MARINE FIELDS.

— KIRLOSKAR CUMMINS LTD. THE ONLY PLANT IN ASIA WITH A1 PLANT APPROVAL FROM LLOYDS.

CUMMINS DIESEL SALES & SERVICE (INDIA) LIMITED

way to the vast international market for oil field equipment and spares.

Due to sustained efforts and cooperation of indigenous industries, the ONGC has been able to effort cumulative savings of foreign exchange to the tune of Rs 127 crores by developing over 1400 items till March, 1981. These efforts have also been recognised at the national level and the ONGC has so far won eight National awards for import substitution activities and new inventions.

The major items already developed in the country so far include deep drilling electrical rigs, rig power packs, reciprocating slush pumps, mud tankage system, work-over rigs, high pressure valves, flow control equipment, geoscience equipment, spares and accessories used in oil well exploration and production and a host of other items too numerous to mention. Development of X-mas trees and well heads is also in an advanced stage. Our own workshops at Baroda and Sibsagar have made valuable contributions to import substitution efforts by developing heater treater, oil and gas separator, bottom hole winch, mud degasser, Worko-50 and Worko-28 rigs, shot hole rig, hydraulic wire line winch etc etc.

Various types of industries have got good scope to take-up development work. For example, the manufacturers of high horse-power diesel engines and multistage torque converters can make an endeavour to meet our requirement of power packs in the range of 800 to 1200 hp. These power packs are required for providing motive power to the drilling rigs. Industries engaged in the manufacture of load handling equipment can undertake development work of rig tackle systems which consists of multi-sheave crown block, travelling block and hook. Valve manufacturers can examine development of X-mas trees, well heads and high pressure valves with matching flanges. For those manufacturers engaged in the manufacture of industrial roller transmission chains, we have to offered development work pertaining to chains up to ten strands in accordance with various iternational standards. While rock roller bits are being manufactured in the country, scope for undertaking development work of carbide version of bits is still open. There are a number of smaller accessories like relays, two way, three way and four way control valves, quick release valves and air swivel etc which can be manufactured by pneumatic control industries.

Pipelines getting ready to be laid in the sea.

General engineering industries and pressure vessel manufacturers can undertake development/manufacture of items like floating equipment, swivel joint, quick union, slush pump, metallic consumables, sucker rod pumps, sucker rods, ponny rods etc etc. While separaters, heater treaters and storage tanks are already being manufactured in the country, additional manufacturers are welcome. Those entrepreneurs engaged in the electronic industry can take up tape transport for use with digital seismic system, hydrophone, galvenometer, CDP seismic cable, inclinometer etc etc.

We use a very large quantity of seamless pipes as casings, tubings and drill pipes. The requirement of casings up to 5½" diameter is being partly met by an indigenous manufacturer while the scope for undertaking development and manufacture of casings, drill pipes and tubings of larger diameters is wholly open to the industry. The total offtake in respect of casings larger than 5½" size is over 25000 tonnes/annum valued at about Rs 30 crores. In the category of consumable items, rubberised moulded parts form the core. As a matter of fact whatever rubberised items for meeting ONGC needs, have so far been manufactured by indigenous industries, are far below the international standards. The reason for this may be that these parts have to work under very difficult conditions where these are required to counteract effects of abbrasive materials and chemicals. This is virtually a challenge to the rubber industry to come up and develop components which can give performance equivalent to imported components.

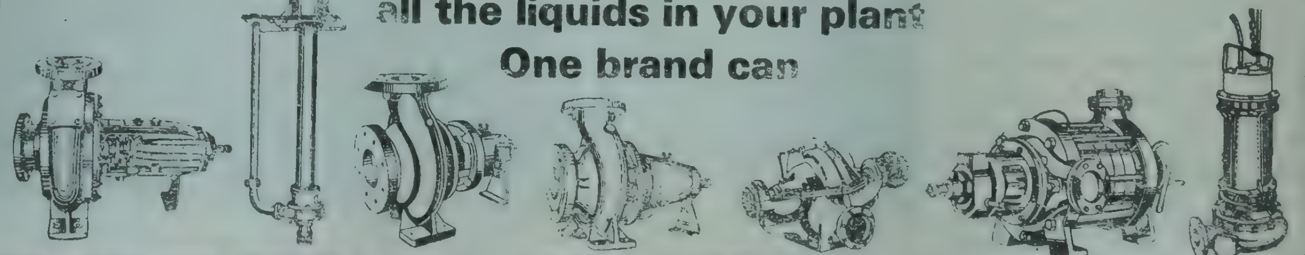
Though indigenous capability has bees developed and its capacity is being progressively increased, scope exists for additional manufacturers who have shore based fabrication facilities. Such platforms comprise 3000 to 6000 tonnes of steel fabrication. In addition some of these will require equipment for installation on various decks. The various deck modules involve development of air conditioning systems, compressors, pumps, residential and power generation systems etc. Such equipment can be developed and manufactured at various locations in the country and thereafter be assembled on the main decks at the fabrication yards, which in view of logistic problems, have necessarily to be located on the seashore.

The Commission's requirement of mud and oil chemicals is substantial. The annual offtake is of the order of Rs 10 crores. The range is wide starting from mud detergent to pour point depressant. Annual requirement of some of these may be as high 2000 tonne. Most of these chemicals are marketed by brand names only and are not amenable to quick indigenisation. A concerted effort has been made to analyse and idenify the constituents of such chemicals so that substitute formulations could be developed and tried extensively before adoption for regular use.

In their offshore operations, the Commission uses varieties of ocean going vessels such as supply vessels, exploration vessels, multi purpose support vessels, drilling rigs, drill barge, drill ships and dynamically positioned drill ship. Some of these vessels are owned and other leased on charter hire basis. The Commission has recently taken a decision to have its own fleet of offshore supply vessels and would be procuring about 20 of these mostly from the indigenous yards. Even for sophisticated vessel like multipurpose support vessel or drill ship provision is invariably made at the time of purchase for transfer of technology to an indigenous yard so that subsequent requirement could be met from within the country.

Yet another area of high priority for indigenisation is that of services. Presently the Commission is engaging foreign contractors for highly sophisticated drilling, cementing, diving, and stimulation services as also operating and management services for various types of vessels mentioned in the preceding para. Beginning has already been made to progressively indigenise these services. Even the present helicopter fleet owned and operated by foreign contractors would be replaced by Commission-owned helicopters operated by IAF crew in the near future.

As would be seen from the above, the list of imported items is long. Not all of these are amenable to indigenisation though. In the oil industry the stakes are high. Failure of a material costing only a few rupees can easily result in a loss of few crores. The need for strict conformity to specifications and extensive trial can hardly be overemphasised. Some items have very high technological content but low offtake. In some cases, the cost of setting up the manufacturing facility is too high and required production too small for making such unit economically viable. It may be futile to attempt indigenisation in such areas even with an eye on export market. Not deterred by these considerations, the drive for indigenisation continues incessantly in the Commission. For, even though stakes are high reward is even more satisfying.



One pump can't handle all the liquids in your plant
One brand can

KIRLOSKAR

You have so many things to pump...clear water, turbid water, slurries, corrosive liquids, viscous liquids, sewage, effluent, hot liquids...

They require different types of pumps. We make them all...in different materials and sizes...from a small one pumping 0.5 Litres/sec, a giant with a 5600 lit/sec discharge.

With our own total resources... technology, entire manufacturing and testing facilities, we control every step of manufacture...and you get a product that's practically fail-safe. And we back it up with an excellent, countrywide, prompt pre-and-after-sales service network.

So, bring your pumping problems to us. We'll solve them.

Offshore hydrocarbons: Challenge and opportunity

By **A. K. MALHOTRA,** *Member, Offshore, ONGC.*

THE eighties may well mark a new turning point in the continuing saga of offshore hydrocarbons exploration and development. The dependence of India on imported crude, and the prospect of even greater dependence on uncertain and insecure sources of foreign supply — lends a special emphasis to our plans to explore for and develop oil and gas. I shall focus my remarks on the supply side of the picture and lead to conclusions which, briefly stated are :

(i) "There are ample resources of petroleum in the world, still undiscovered, which should permit an orderly transition from our present petroleum dependant civilisation to a society based on alternative energy sources during the next 30-50 years". The problem today is of price, not availability.

(ii) That much of this oil/gas would be in smaller pools and/or harsher environments but would become recoverable with advances in technology.

(iii) That these resources can be economically exploited given the requisite capital, technology and management.

(iv) That the effort being made today needs to be accelerated and that the special problems that India and Indian industry face today present both a formidable challenge and a magnificent opportunity.

Exploring for oil

Despite popular views to the contrary, oil industry sources continue to assert that there is plenty of oil and gas yet waiting to be discovered — atleast enough such that there can be an orderly transition to a non-oil based economy in the next two decades. Many other estimates all point to the fact that 'as much oil is yet to be found as has already been found'. At the 10th World Energy Conference, a Delphic poll of the delegates also forecast that 45 per cent of the ultimate world oil and gas reserves would come from offshore.

Various experts have estimated the ultimate recoverable reserves of crude oil from shale, heavy oil deposits and tar sands at 3.4 trillion bbls — broken up as :

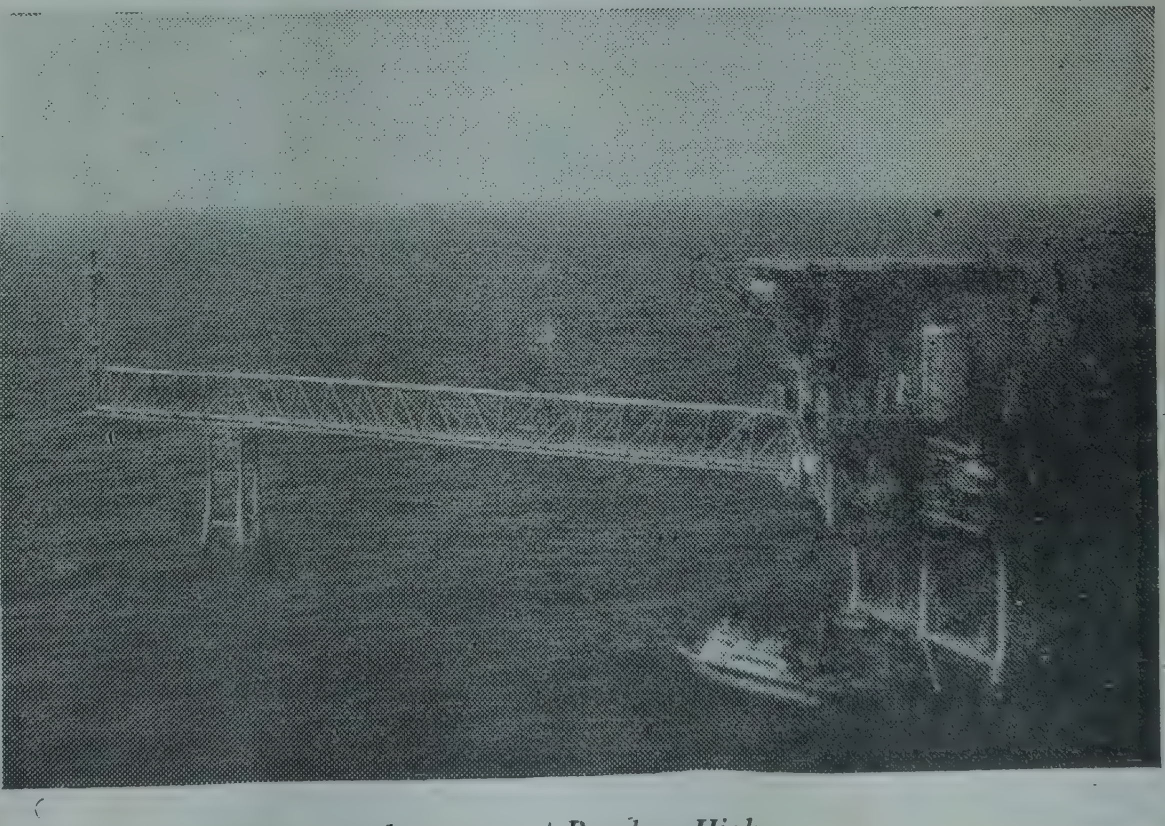
	Trillion
Already produced	0.4
Already discovered	0.6
New discoveries	0.75
Enhanced recovery technology ..	0.65
Shale oil recovery	0.20
Heavy oil and tar deposits	0.80
Total	3.40

P. J. Wood estimates 1.038 trillion bbls of oil has already been discovered and another 1.125 trillion bbls can be potentially discovered. Thus it may be prognosticated that as much as 500 billion barrels of oil are likely to be found offshore.

As we have learned more about origin and distribution of petroleum, our estimates have increased — from a low forecast of 400 billion bbls in 1943 to a high of nearly 4 trillion bbls in 1978 — a 10-fold increase in 3/5 years. Thus even the estimates made today may turn out to be underestimates a decade later. Besides, the economic oil base used for these estimates is dependent on costs, which in turn, depend on the developments of technology. While there may have been more "petroleum originally in place" in smaller reservoirs proportionately more may have been uneconomical to produce in the past. But major technological advances and improved petroleum prices can convert the smaller, deeper or more remote reservoirs to profitable ones, thus increasing further the estimates of the economic oil base.

In the oil industry, reservoir size distribution seems to follow a low-normal pattern — there is a relatively small number of giant reservoirs and a relatively large number of small ones. Data show that the sum of oil in the small reservoirs is, however, far larger than that contained in the giants. In the US, only 36 per cent of known oil finds are found in the giant reservoirs (*i.e.* greater than 500 million bbls) while in the world as a whole, 75 per cent is in giant accumulations. According to Wood "technology and economic incentives advance sufficiently, the world as a whole should attain a drilling maturity approaching that of the US". The clear implication is that there are a large number of small reservoirs still to be discovered outside the US — and which are likely to be found if exploration work is intensified to a degree approximating the US today.

Another approach to the problem of oil exploration lies in the geology of the earth. Oil/gas are formed and trapped in sedimentary basins and a very generalised three-fold classification based on the "concept of crustal plates that move over a long periods of time and change their positions relative to one another" has been developed. The oil-bearing basins



'SA' process platform in southern part of Bombay High

are identified to lie in three kinds of basins :

Convergent — basins on margins of plates moving towards one another.

Divergent—basins on margins of plates moving away from one another.

Interior continental plate — basins remote from the continental margins at the time of basins formation.

The distribution of known oil accumulations in the world today is :

Convergent — 9 per cent of known oil/gas in the world.

Divergent — 23 per cent of known oil/gas in the world.

Plate interior — 68 per cent of known oil/gas in the world.

Also giant oil fields contain more than 75 per cent of world's known reserves. The distribution of giant oil fields is convergent 11 per cent, divergent 27 per cent and interior 62 per cent. The point to note is that this distribution may very well be a function of degree of exploration that each basin type has undergone. The interior basins are, for example, readily accessible while the others are not.

The majority of the world's prospective area is non-productive todate. Present studies indicate that as many as 145-155 major basins and sub-basins are virtually undrilled at this time. The offshore sedimentary basins cover 50 million sq km (as compared to 65 onshore). The continental shelf has 15 million sq km whereas the continental slope (200-300 m water depth) covers at least 25 million sq km.

Based on an analysis of the above factors, it has been estimated that the prospects for growth of offshore oil production in the years to come are as given in Table 1.

At present, proven reserves of offshore petroleum total 155 billion bbls or 23 per cent of world's proven reserves. For natural gas, figure is 17 per cent. It is prognosticated in the industry that the reserves to be discovered are at least 5 times those already discovered.

Indian assessment

The total land area occupied by the sedimentary basins in India is about 1.4 million sq km or about 42 per cent of the total land area. Sedimentary basins offshore have an area of 380,000 sq km up to a water depth of 200 metres. The ratio of onshore and offshore sedimentary basin to the land area is considerably less in India as compared to the world as a whole *i.e.* 42 per cent versus 75 per cent on land and 10 per cent v/s. 33 per cent offshore.

Of the total geological oil reserves from the various sedimentary basins in India, 67 per cent are estimated to be offshore. The total recoverable reserves onshore are about 40 per cent, while offshore oil is estimated at 60 per cent. For gas, recoverable reserves lie mainly offshore, constituting about 93 per cent of the total recoverable reserves of gas.

According to present projections, the offshore areas of India will provide a peak recovery rate of about 300,000 BOPD and a total gas of about 21-23 MMCMD. It should, however, be noted that these Indian projections are based on existing proven reserves. They do not take into account any additional discoveries in new fields. And finding new oil fields is a function of the effort expended to find new sources of petroleum.

Table I : Oil prospects (mbopd)

Region	1960	1968	1973	1978	1990	Growth rate 1978-90 (Percent)

Industry facts on exploration

Statistics on exploration drilling versus prospective areas are not readily available. As can be seen from the table below, the US which is the most densely explored area in the world, has an exploration drilling density of 1 well in every 15 sq kilometres of prospective area. The comparative figures in India would be (for ONGC) of the order of 1 well in every 750-1,000 sq km. Offshore, the averages are 75 wells for an area of 380,000 sq km *i.e.* 1 well in every 4,500 sq km. While more drilling figures by themselves do not necessarily indicate the presence of hydrocarbons, clearly the effort made by us has been much smaller as compared to the US.

Exploring drilling

Density—onshore and offshore

U.S.	1/15	sq. km.
Europe	1/500	sq. km.
S.E. Asia Latin America Africa	1/1000	sq. km.
Middle East	1/2000	sq. km.

Uptill now only 200 exploratory wells have been drilled in water depths greater than 200 metres *i.e.* the drilling density is 1/175,000 sq km.

According to industry statistics (1943-52 data), to find ultimate recoverable reserves, the number of wild cats which had to be drilled are as in Table 2.

In the North Sea, over 51 dry holes were drilled before oil was found. Thus there is inherent risk in oil exploration and it is important to remember that even new advances in technology have not eliminated that risk.

A third factor of note is the increased activity in offshore oil industry in recent years. The offshore industry in 1979 drilled a total of 2,852 offshore wells — of which 1,240 were in the US. It is expected that the number of offshore wells will increase to 4,420 by 1985, thus placing great demands on equipment and materials. A typical exploratory well in the North Sea today costs about $ 8-10 million, while the corresponding figures for development wells in the North Sea and the Gulf of Mexico are $ 1.5 million and $ 3.1 million respectively. The number of drilling rigs in 1979 were 441-28 submersibles, 212 jack-ups, 119 semi-submersibles and 82 drillships/drill-barges. The cost of these units varied from $ 28-37 million for a deepwater jack-up, $ 75 million for a semi-submersible and $ 79 million for a dynamically controlled drillship today, but these costs are going up rapidly. Thus, the facts are that not only will exploration equipment be in short supply in the future, but that it will also be extremely costly even when available. This increase in offshore activity around the world has been caused by the following factors :—

- There is a shortage of oil in the international market place and this will probably persist throughout this decade.
- The soaring price of oil is opening up new offshore areas.
- Geologists estimate that 40-45 per cent of undiscovered oil and gas producible reserves will probably be found on continental shelves and margins — in areas which have yet to be explored.
- LDC's are keenly interested in initiating explorations of their offshore areas.
- Improving political climate is permitting companies to make major investments on new technology and equipment.
- Improved geophysical technology is making offshore oil/gas easier to find.

This increase in demand will skyrocket the demand for rigs, equipment, technology, services and capital. The implications of this sudden upturn in the offshore industry is bound to have profound implication on the Indian offshore effort.

Indian offshore export

The first step in offshore exploration in India was taken by the Oil and Natural Gas Commission (ONGC) in 1962 when an experimental seismic survey was undertaken in the Gulf of Cambay by its own seismic party, resulting in the discovery of the first offshore structure. Aliabet at the mouth of Narmada River. Another offshore structure, Tapti was detailed 25 km east south-east of Hazira. Soon after in 1964-67 regional reconnaissance (with locally semi-detailed) surveys were undertaken by a Russian seismic ship "Akademic Arkhangeliskey" for the ONGC in the Gulf of Kutch, parts of the Gulf of Cambay and the Arabian Sea, areas off the coast of Kerala, Gulf of Manaar, Palk Strait, Coramandal coast and the Bay of Bengal. A number of structures, including the present Bombay High structure, were delineated in the Cambay Basin and indications of anticlinal reversals were obtained in West Bengal, Godavari, Cauvery and Kutch Offshore.

In the early seventies, ONGC was entrusted with the responsibility of exploration and development of the Bombay High region. Consequently, the ONGC carried out detailed seismic surveys of Bombay High and some of its adjoining structures. Since the hydro-meteorological conditions and sea-bed conditions in the Bombay High region are difficult and warranted serious study for the selection of drilling rigs and equipment to be deployed before commencing drilling, the ONGC after obtaining expert opinion in this respect placed order in Japan for fabrication of a jack up type drilling rig in February 1971. The drilling rig *Sagar Samrat* arrived in Bombay in 1973. *Sagar Samrat* commenced drilling operations in Bombay High on January 31, 1974. Three weeks later, on February 19, 1974, oil was discovered in a limestone reservoir.

The offshore effort was further reinforced by purchase of a seismic survey vessel *Anweshak* in July 1975.

The Indian continental shelf *i.e.* up to water depths not exceeding 200 metres, covers an area of 380,000 sq km.

Offshore geophysical surveys in Indian waters are being conducted by the ONGC since 1963 for petroleum exploration. So far about 1,56,000 km of geophysical data have been acquired in different offshore basins of India. Reconnaissance survey has been completed in the continental shelf (up to 200 metres water depth) except in two areas, off Kakinada-Puri and Ongole-Madras where only regional survey has been done. A beginning has also been made to extend the geophysical survey into deeper waters (water depth greater than 200 m) over the continental slope and beyond. This includes survey along several regional lines in the western continental margin and reconnaissance survey in parts of continental slope in Bombay offshore region and Godavari-Krishna offshore.

The next stage in oil exploration-drilling wells has also kept pace with the geological and geophysical work. Till March 1981, ONGC had drilled 91 offshore exploratory and assessment wells. These have led to discoveries in Bombay High field and also further discoveries of oil in commercial quantities in the structures North Bassein, Bombay High fault-closure, B-38, R-12, R-9 and R-7 and significant oil shows in three structures *viz* D-1, B-22 and B-37. Further, two gas bearing structures *viz* South Bassein and South Tapti have also been discovered. Outside the Bombay offshore region, the ONGC has discovered oil in Godavari basin and gas in Andaman offshore. Indications of gas were also available in structures near Porto Novo in Pondicherry offshore. Apart from these discoveries, one exploratory well in Kerala offshore. one exploratory well at Kasargod offshore, two exploratory wells in Palk Bay have also been drilled. In summary, the ONGC in the offshore effort so far has drilled 91 exploratory wells. Of these only 35 have proven to be dry, thus giving ONGC a "success ratio" of 1:1:6.

Besides the ONGC, foreign agencies, M/s Reading and Bates have drilled one exploratory well in offshore Kutch, M/s Carlesberg Natomas two exploratory wells in Bengal offshore and M/s Asamera one well in Gulf of Manaar in Tamil Nadu offshore.

As a result of these efforts, recoverable reserves of the order of 240-250 million tonnes of oil and 270 billion cubic metres of associated and free gas have been established up to January, 1980. At present day prices, these amount to a saving in foreign exchange of Rs 50,000 crores in crude oil alone.

Soon after completion of the fourth assessment well in Bombay High in April 1975, plans were drawn up for putting the Bombay High field early on to commercial production. The first phase of the development programme envisaged establishing facilities for producing oil up to 40,000 barrels per day. This consisted of installing one well-cum-production platform called 'A' platform. three well-head platform called B, C and D platforms, one flare platform (for flaring the associated gas), one SBM. (Single Buoy Mooring System) for mooring tankers and loading oil into the same and all these installations inter connected by pipelines laid on the sea bed. Each well platform was provided for drilling four wells and the production platform is equipped with facilities to process 40,000 barrels of production from the wells by separating oil from gas and water. The Phase I installation work began in December 1975 and the first barrel of oil from the wells drilled at 'A' platform was pumped into the tanker *Jawaharlal Nehru*, moored to the SBM system, on May 21, 1976. This was accomplished in just two years from the initial discovery of oil in February 1974. The discovery to commercial production time of 24 months was one of the fastest effort in the offshore industry.

The target of 40,000 barrels of oil production per day equivalent to the annual rate of two million tonnes was achieved in January 1977 after drilling additional production wells.

Endouraged by the results achieved, the Phase II deveolpment programme of Bombay High field was taken up in early 1976, for establishing production facilities for an additional 40,000 barrels of oil per day. The installation of one well-head platform ('E' platform) and converting 'C' platform into a well-cum-production platform and installation of a second S.B.M. system were completed by April, 1977. In all 20 production wells were drilled in Bombay High and the production rate of 80,000 barrels of oil per day corresponding to four million tonnes per annum was achieved by January, 1978.

In this system of development, oil produced from the field was loaded into the tanker moored to the SBM and transported to shore by a shuttle tanker. The associated gas produced with oil was flared until a pipeline would be laid to carry the gas ashore. The tanker operations for loading oil through the SBM system also had problems of continuous operations as the weather conditions during the monsoon months (June to September) did not permit keeping the tanker moored to the SBM system, thus necessitating stoppages of production during these months.

In order to continue year round production, handle further expansion of production from the field, maintain uninterrupted flow of oil to the refineries and utilise the associated gas onshore, the ONGC planned to lay separate oil and gas submarine trunk pipelines from Bombay High field to Bombay shore and further on to Trombay where refineries, fertiliser and power plants are situated. The laying of 30" oil line and 26" gas line to shore at Uran and further lines to Trombay were completed by July, 1978 and oil and gas immediately started flowing to the consumers at Trombay. For the pre-treatment to gas and pumping of crude that is required prior to their being transported through the pipeline, the platform 'F' was installed by May, 1978 at the offshore end of the pipelines at Bombay High fields.

With the completion of these facilities the rate of production went up to 100,000 barrels of oil per day corresponding to five million tonnes per annum in December, 1978.

The next phase of the programme envisaged the step up of production of crude oil from Bombay High to 140,000 barrels per day corresponding to seven million tonnes per annum by installing a giant process platform, BHN and more well platforms. The BHN platform was commissioned in May 1981.

Besides this, a four million cubic metre per day capacity gas fractionation with LPG extraction facilities of 198,000 tonnes per annum, has been installed at Uran. Similarly, a crude stabilisation plant with storage tanks for storing stabilised crude has also come up at Uran.

The Phase IV of the programme is presently under implementation. In the programme, it is planned to step up the production of crude oil from Bombay High from 140,000 to 240,000 barrels per day corresponding to 12 million tonnes per annum by middle of 1982. During this phase of development Bombay High South (BHS) process platform, similar in design and capacity to BHN, will be installed in the Central/South part of Bombay High, adjacent to SA platforms. Moreover, another 10 well platforms will be added to the field to step up production to 240,000 BPD.

Work has also started on installation of telemetry and telecommunication facilities between the various platforms in the field and between the offshore field and the shore terminal at Uran *via* satellite link. Under this system, telemetry and telecontrol facilities are to be provided for BHN and associated well platforms and also for the platforms in Bombay High central/south region. The telemetry of the Uran terminal as well as for the associated pipelines to Trombay and consumer points will be provided. For the sub-sea trunk pipelines, there will be a control and communication satellite earth station located at Bombay High North with a corresponding control earth station (shore) at Uran.

Similarly, work has started for developing ONGC's supply base and wharf at Nhava for supply vessels to dock, for drilling rigs and other ancillary equipment to be repaired and for storage of materials and supplies for offshore.

The investments in the development of our offshore fields have been as follows :

Phase 1 & 2	Rs 150 crores
3	Rs 554 crores
4	Rs 365 crores
5	Rs 214 crores
(advance action)	

In addition to these, government has under consideration plans for the development of South Bassein gas field and the Ratnagiri oil field.

For the investment, oil and gas reserves already found by the ONGC will provide a return of approximately Rs 60-70,000 crores.

ONGC's future plans

A five year plan has been drawn up by the ONGC covering the Sixth Plan period (1980-85) to accelerate the pace of work. This plan envisages the following:

The drilling of 95 exploratory wells and 229 development wells. For this drilling effort, the ONGC's present fleet of three owned rigs will be increased to 7 by end 1982.

The number of platforms to be installed will be about 50. Since the working season of offshore India lasts for 6-8 months, this implies that the ONGC will be on an average installing one platform every month for the next five years. Besides the platforms, there will be need for 300-400 km of submarine pipelines to interconnect these platforms.

With these efforts, the ONGC plans to produce about 52 million tonnes of oil during the five year period, thus providing a foreign exchange saving of Rs 10,000 crores in this period in crude oil alone. Based on present plans, the peak rate from known fields today will rise from the present five million tonnes/year to about 13.2 million tonnes/year in 1985.

In order to accelerate the production from offshore region, an accelerated plan for production has already been submitted to the Government and an accelerated exploration plan is under submission. These programmes envisage oil production of over 63 million tonnes during the plan period and drilling of 107 exploratory wells.

As far as gas is concerned, the ONGC's plans are to a large extent dependent upon the plans of the downstream uses of the gas. The total gas production, as presently planned, envisages the availability as 2 MMCMD by 1981, 2.88 by 1982, 3.6 by 1983, 8.6 by 1984 and 13.6 by 1985. Plans for LPG from the gas envisage an increase from 10,000 tonnes/month in early 1982 to about 19,000 tonnes/month in 1985.

It is, however, important to note that the above plans are based on discoveries made to date. Should the finds in R-7, Andamans and Godavari prove to be commercially viable, ONGC's plans would increase even further and the present outlay of Rs 1,837 crores for the five-year period may well have to be increased substantially.

Indigenisation—problems and prospects

The large investments that will be required for the development of India's offshore fields clearly present a major opportunity for the Indian industry. The problems and the prospects for such indigenisation, however, need to be examined in the context of both the structure of the international offshore industry today and the specific requirements of the Indian situation. Two major objectives for India are, one, to develop its offshore hydrocarbon resources in a phased manner so as to optimise its total returns from these discoveries over a time period and two, to increase the amount of indigenous content in these projects of both hardware and software — so as to provide opportunities for the utilisation of the capacity and capability built up within the country within the confines of the requirements of the projects.

The internal structure of the offshore industry places its own additional constraints on what can be done to attain those objectives. As has been indicated above, offshore development programmes are extremely capital-intensive. Moreover, the investment decisions have often to be made before all the required data are available in order to hasten the process of development and returns. This implies that certain uncertainties are inherent in the situation, and since the costs are so high, decisions require both a great deal of courage and ability to take risks.

As one result of this, most agencies who are just entering the offshore industry express a desire and need for entrusting the responsibility of setting up offshore production systems on a 'turn-key' basis. Normally, this desire of the clients for single-point responsibility is reflected in the development of 'consortiums' among the contractors. Given the structure of the offshore industry, and the relative risks involved, such consortiums are usually led by the offshore installation contractors.

The major source of profits for the installation constructors who have invested heavily in the expensive derrick- barges, cranes, pipelay vessels *etc* lies in their maximum utilisation of their construction equipment rather than in fabrication or equipment supply. Many of the international contractors in this industry have integrated backwards into fabrication of platforms or their engineering only in recent years, and that too has been with the prime objectives ot meeting customer demands for single-point responsibility and/or tight time targets. These installation contractors normally do not manufacture or produce 'in-house' even 10 per cent of the equipment which goes into offshore production system unless they operate their own fabrication yards. Thus almost all the equipment required are purchased by them from outside manufacturers. Over the years, each installation contractor may have established links with a specific manufacture for a specific range of equipment based on their cost, delivery and performance, but what is more visual is that the installation contractor himself goes out for competitive bids to various vendors.

The supplies of equipment for offshore production systems generally provide a completely engineered-and-packaged product. The vendors do carry out considerable pre-engineering and system engineering of their product. Special emphasis is paid to application engineering to meet any special requirements for modifications to their standard equipment for the client. Many of these equipment are mounted in 'modules' or 'skids' with all piping, electrical wiring, valving, controls *etc* all built-in. Commercial terms offered by them include guarantees as well as conformance to internationally acceptable standards of practice and codes. Spare parts, service engineers for installation and commissioning and maintenance advice have been provided generously and generally as a part of the package, Assistance for 'trouble shooting' is not only promised but given freely, sometimes at very short notice. Thus, if Indian vendors are to successfully enter the international offshore industry, they must be willing and able to provide such packages and services as well.

The stringent requirements of quality as well as the need to minimise repairs and maintenance offshore require an emphasis which is completely different from installations on land. The cost of even minor repairs or replacements offshore is out of all proportion to the actual cost of the component itself. This arises out of the heavy cost of offshore construction equipment, where even a small derrick-barge hires at Rs 3-4 lakhs per day, a single helicopter ride may be as much even as Rs 20-40,000 per trip work boat at Rs 25,000 per day.

An example will illustrate the need for detailed planning as well as the strictest quality control for offshore production systems. If an additional generator is required or if a defective part is to be replaced to produce continuous power for telemetry and telecontrol after the production system has been installed, the cost to be client may be as high as Rs 1,600,000 although cost of the generator may only be Rs 160,000. This is due to the fact that a small derrick barge crane may need to be mobilised from Singapore or the Persian Gulf at a daily cost of Rs 160-180,000. And if this unit requires some welding to be done, the entire production on that platform may have to cease from safety consideration — thus increasing even further the costs to the client. This will hopefully underscore the need for the highest quality standards and reliability in equipment used on offshore production platforms.

The Indian industry certainly possesses the inherent capability to overcome these problems. But the indigenous industry, on its part, must gear up its technology and organisation to meet the special requirements of the offshore industry.

Prime among these, is the need for assured quality of products within the stipulated delivery dates. There is the customer requirement of system engineering of packages, skilds or modules—which could be met through formation of suitable local consortium of complementary product firms. The cost of repairs of offshore which compels the client to insist on the highest possible quality standards could be met by use of international certification agencies or quality assessment laboratories. There is, however, a need for a caution — indigenisation should not be taken to mean complete substitution. There is a need for some perspective on the part of the industry so that, for example, a small value-supplier should not hold the offshore production system to ransom.

The industry will also have to spend more time, and effort on pre-engineering, custom application engineering and on client education. Finally, potentially the most effective selling point of local industry — and today paradoxically its weakest link — is the after sales and maintenance services. Given its proximity as well as the cost of technical manpower, indigenous industry has an in-built competitive edge which it has yet to exploit effectively. The country's offshore oil programme provides a unique opportunity for the development and growth of indigenous capabilities and industrial capacities. It is a challenge that I am sure the indigenous industry will be able to meet.

In conclusion, the major issues that have been highlighted above, could be summarised as follows:

— There are considerable hydrocarbon resources still to be discovered — particularly offshore.

— These resources will be found in smaller pools, deeper waters and harsher environments but given requisite capital, technology and management can be economically exploited.

— Offshore oil exploration is a high-risk, high investment and high returns venture.

— ONGC's performance to-date has been comparable to any in the offshore oil industry and it has already discovered hydrocarbons, at international prices of over Rs 60,000 crores.

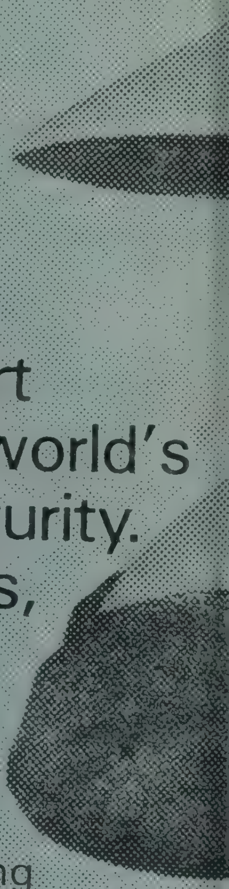
The ONGC in 1980-85 will be undertaking a major expansion in its offshore effort with an investment of Rs 1,837 crores, which will result in a saving of about Rs 10,000 crores in the same period.

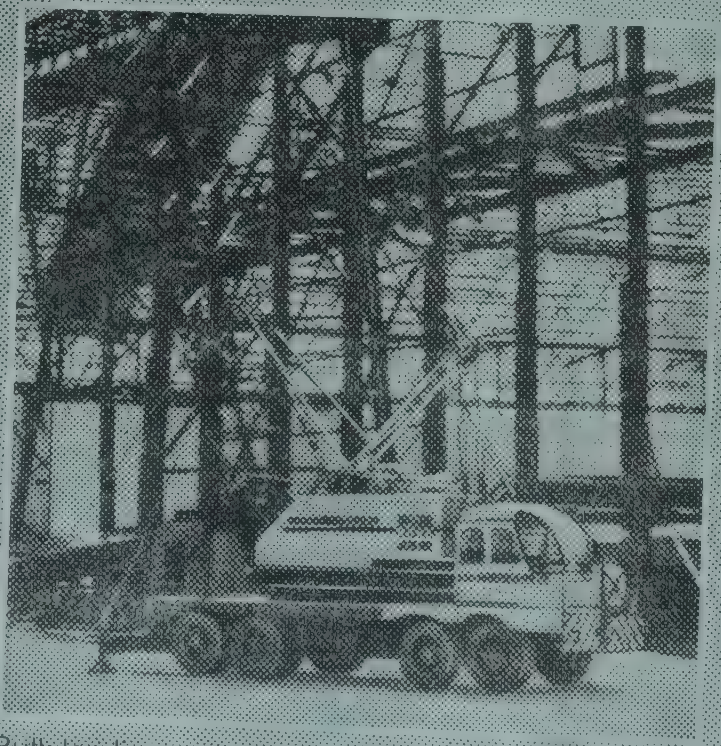
This programme will provide a major challenge and opportunity to th Indian industry.

SIEMENS

Export Profile

From products to total projects, India's export pattern has changed; we compete with the world's best. Siemens India reflects this growing maturity. We tender globally, export products and skills, and execute turnkey assignments from blue-print to commissioning.





Bulk loading sugar terminal at Port Louis, Mauritius.

Siemens India's projects abroad include a bulk-loading sugar terminal (Mauritius), six 70kV substations (Indonesia), a container terminal (Oman), power supply systems for the National Assembly Building (Bangladesh). Products go to Asia, Africa, Germany, USSR. We also serve as Export House for small and medium industries.

Siemens India today: 6 works and nearly 7000 employees. Engaged in power, communications, medical engineering for India's drive for self-sufficiency.

If you'd like to know more, write to:

Growth and prospects of onland exploration

By **H.G.T. WOODWARD**, *Member (Onshore), ONGC*

THE search for oil in India began seven years after the first oil well was drilled in Pennsylvania, USA by Col. Drake in 1859; efforts, however, were earlier confined to the upper Assam Valley only. The Government's policy towards oil exploration at the national level took a concrete share around 1955-56. About the same time, the industrial policy resolution of April 30, 1956 was passed, which placed mineral oil in Schedule 'A' stating clearly that "future development of oil industry will be the exclusive responsibility of the State". The Government of India created a petroleum division within Geological Survey of India (GSI) in 1955 for oil exploration work. Soon the petroleum division of GSI grew into a Directorate of Oil & Natural Gas Commission which was raised to the status of a Commission on August 14, 1956. The Commission was later converted into a statutory body on October 15, 1959.

In the twentyfive years since its inception the ONGC has matured into one of the technologically self-sufficient oil companies among the developing nations. It is one of the few oil companies in the world engaged in every aspect of oil exploration, drilling and production. So far (till June 1981) about 3½ million metres and 1,689 wels have been drilled in onshore areas. 198 structures have been drilled of which 58 structures were found oil bearing. Starting from a production of 0.04 million tonnes in 1961-62 from Gujarat, a production of 4.23 million tonnes was attained in 1980-81. Cumulative production of oil and gas from onshore areas amounts to about 68.31 million tonnes and 7,551.80 million cubic metres respectively. A large number of wells have been drilled and tested onshore in Gujarat (1,268 wells), Assam (351 wells), Tripura (5 wells), Meghalaya (2 wells), Nagaland (3 wells), West Bengal (6 wells-, Uttar Pradesh (4 wells), Bihar (2 wells), Punjab — Himachal Pradesh (10 wells), Tamil Nadu and Pondicherry (18 wells), Jammu & Kashmir (3 wells), Andhra Pradesh (1 well) and Rajasthan (16 wells), but significant discoveries of hydrocarbons in commercial quantities have so far been made in Gujarat and Assam only. Presence of hydrocarbons has been established in Rajasthan, Tamil Nadu, Andhra Pradesh and Himachal Pradesh; so far these have not been proved commercial.

Several new techniques like extensive use of digital units for seismic data processing, continuous computerised pressure prediction during drilling of wildcat wells, induction of new indigenous sophisticated electrical rigs etc have been introduced in onshore areas. Digital logging units were recently introduced for effective formation, evaluation and reservoir monitoring. Also several new fields like Jhalora, South Sobhasan, Viraj, Jothana, South Santhal, Motwan, Sisodra in western region, Amgurai and Charali-6 in eastern region have been brought under production. The scope of exploration has been broadened and intensified by seismic coverage in Gandak depression, Surma Valley, Krishna Godavari and Cauvery basins.

In 1974-75 an Indo-Soviet team carried out a study of onshore basins (1.4 million sq km). Thirteen prospective basins have been identified by the team, and this forms the basis of prospect categorisation and input distribution for future plans.

Based upon the above assessment an accelerated programme of exploratory drilling has been initiated in the producing basins of Cambay and upper Assam, and the highly prospective areas of West Bengal, Tripura and Krishna Godavari.

According to the present day knowledge and known technology

estimated that the following is the remaining quantum of regional seismic survey to be completed :

	Area/Basin	(In line km)
1.	Ganga Valley and Himalayan foot hills	4,000
2.	Rajasthan :	
	(a) Jaisalmer District, ...	2,000
	(b) Bikaner Nagore basin ..	1,000
3.	West Bengal	1,500
4.	Tripura and Mizoram	1,500
5.	Krishna Godavari	500
6.	Cauvery	2,000
7.	Assam	2,000
8.	Cambay basin	2,000
	Total	16,500

To complete the above task it is proposed to increase the number of seismic parties to 35 and also improve the technology to increase their output. This will enable ONGC to grade the basin sectors accordingly to their prospects.

The onshore activities are divided into three sectors' regions namely Western Region, Eastern Region and Central Region. In brief the prospects and future programme of work envisaged in these regions are indicated below :—

Western Region

The Western Region areas include Cambay basin in the State of Gujarat together with Kutch and Saurashtra. Cambay basin is a maturedly explored basin; it is now sought to :—

a) Explore for subtle traps in known producing areas;

b) explore for deeper prospects (Ankleshwar deep well); and

c) extend exploration to lesser explored parts of the basin (Tarapur and Broach blocks).

It is proposed to increase the num

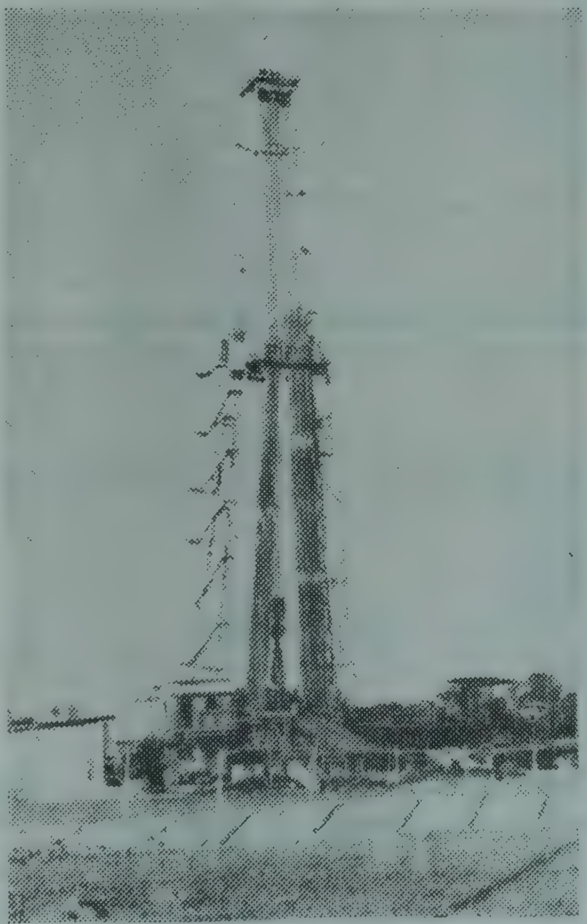
80 (field season) to 10 by 1984-85. Besides, one contract seismic party is proposed to be deployed in the highly prospective shoal areas during 1981-82 and 1982-83, season. In the current five years 1980-85, it is proposed to deploy 14 to 15 rigs and to undertake drilling of 249.7 thousand metres of exploratory drilling and 250.3 thousand metres of development drilling. All these exploratory efforts are directed towards establishing at least 20 million tonnes of additional recoverable reserves during the five year period. Regarding production of oil and gas from this region, so far 58.81 million tonnes of oil and 7,507.63 million cubic metres of gas have been produced.

However, Ankleshwar field in Gujarat which supplied the bulk of the onshore crude oil is on the decline. A team of Soviet experts has studied and recommended a development programme so as to recover the maximum possible crude oil from this field-this programme is under implementation. The crude produced from Ankleshwar is highly valuable for the preparation of detergent alkalytes in petro-chemical plant at Baroda. It was, therefore, considered necessary to produce this crude from a longer period as far as possible to meet the requirement of Indian Petro-chemicals Corporation.

The production from North Gujarat fields is being kept at 1.4 million tonnes per annum throughout the five year period 1980-85. This will be stepped up when the catalytic cracking unit at Koyali is set up to handle higher quantities of LSHS crude. During the five year period the annual production from this region will range between 3,00-2.80 million tonnes per annum. Various enhanced recovery techniques like trial water flooding in Nawagam field, selection of appropriate polymer for injection in Sanand field and also thermal flooding in Balol-Santhal field are planned to improve recovery from these fields.

Eastern Region

This region is considered to be highly prospective. About thirty structural features have been identified in this area so far. Twentyeight structures has been undertaken for drilling, of which, hydrocarbons have been found in eight structures. The thrust of further exploratory efforts in this area is proposed to be directed towards the Naga foot-hills in the Surma and Dhansiri Valley. During the current five year plan it is proposed to increase the seismic parties to eight. The tempo of drilling activity is also planned to be increased by gradually increasing the number of drilling rigs from 12 in 1980-81 to 18 during 1984-85. The quantum of exploratory and development metreage envisaged during the five year period is 300 thousand metres and 330 thousand metres respectively.



An onshore rig.

The production of crude oil from this region is planned to be increased from 1.7 million tonnes per annum in 1980-81 to 3 million tonnes per annum in 1984-85.

Central Region

On the basis of present day knowledge, four basins of the Central Region are considered to hold the maximum potential *viz* Godavari, West Bengal, Cauvery and Rajasthan. In Godavari two rigs are operating at present. The rig strength will be gradually raised to four rigs. In West Bengal two rigs (1 deep and 1 medium capacity) are at present deployed. Here again it is planned to further intensify the exploration activity by deploying three rigs. A US consultant has been engaged for preparing a delta model of West Bengal and to suggest further lines of work. It is proposed to re-enter the Cauvery basin for the further exploration.

Available data of Cauvery basin has been reviewed by a well-known US petroleum geology consultant and based on his recommendations further exploration will be carried out. In Tripura 3-2 rigs will be deployed during the plan period.

The total exploratory metreage in Central Region areas will go up from 17,300 in 1980-81 to 57,000 in 1984-85. The total number of rigs will go up from seven in 1980-81 to 15 in 1984-85. During the next five years 51 wells with a total metreage of 202,000 are planned to be drilled in Central Region areas. It is proposed to increase the tempo of geophysical survey work also in Central Region. The total number of seismic parties will go up from 18 in 1980-81 to 20 in 1982-83. A contract party will carry out teleseismic 'eD work in Himalayan foot-hills during 1980-81 and 1981-82 season. In the Sunderbans area about 2,000 line km of seismic surveys have been completed in the shallow water zone by a foreign seismic party on contract. Further work in the shallow water area is currently progressing. Joint Indo-Soviet seismic parties are planned for Tripura and West Bengal areas during the plan period.

Thus a systematic approach to explore and exploit the prospective sedimentary basin in onshore areas of the country has been formulated for the next five years.

DYNAMICS OF OIL INDIA (OIL)

Young in years but rich in experience, Oil India (OIL) harmonises optimisation of resources with growth in the vital spheres of exploration, production and transportation of crude oil/natural gas from indigenous sources within its limited leases of 1990 sq kms in Assam, 550 sq kms in Arunachal Pradesh. Cumulative production is about 48 million tonnes which is over 40% of total from onshore resources and gross ultimately recovery expectations have crossed the 86 million mark. Pipelines have transportated over 55 million tonnes. In the new offshore concession of 12,000 sq kms in Bay of Bengal, Mahanadi Basin, granted recently, Oil India (OIL) has drilled two wells—Mahanadi 1 and Mahanadi 2.

Processing of Bombay High crude

By A SPECIAL CORRESPONDENT

WHEN the Bombay High offshore field was discovered in 1974, it became obvious that this newly discovered crude should be first refined in the refinery of Bharat Petroleum Corporation located at Bombay, in view of its close proximity to the field. Additionally, this refinery offered maximum flexibility and versatility on account of its design features and the absence of lubricating oil manufacturing which called for special grades of crudes. The first parcel of Bombay High crude was received in July 1976, by tanker, and was processed in the same month. Thereafter, increasing quantities of Bombay High crude were received by tanker till July 1978, when the refinery was connected to the field by a pipeline *via* the ONGC installations at Uran. Since then, increasing quantities of Bombay High crude have been received and processed in this refinery. This article reviews the problems that arose in the processing of Bombay High crude and how these were overcome.

Quality

The Bharat Petroleum Corporation refinery was designed to process crude oils originating in the Middle East. These crudes were having medium gravity, *i.e.* of the order of 34° API, comparatively high in sulphur content, low in aromatics and rich in asphaltenes. When processing the Middle East crudes, the refinery produced satisfactory grades of kerosene and jet fuel, high speed diesel oil, fuel oil, bitumen and solvents. The naphtha fraction was suitable for its use as naphtha cracker feedstock but needed additional treatment for the manufacture of motor spirit.

On the other hand, Bombay High crude is light (38 to 40° API), contains very little sulphur, is rich in aromatics (about 23 per cent volume) in the gasoline/kerosene range and contains large percentage of wax in the heavier ends and has very low asphaltene content. Because of the high wax content, the crude has a high pour point (around 30°C) which meant that at temperatures below 30°C, the crude would tend to gel and remain in the solid state. This meant the crude had to be heated to make it fluid and pumpable.

The high aromatics in the gasoline/kerosene range make it unsuitable for producing hexane, petrochem naphtha, and ATF (jet fuel) without special treatment. Similarly, high wax and low asphaltene content make it unsuitable for manufacturing bitumen (asphalt) and conventional fuel oil. In the last case, low sulphur heavy stock (LSHS) gets produced as an alternative. Except for being waxy and, therefore, requiring heating, LSHS can be considered to be an excellent fuel for furnaces and boilers, and would largely help to reduce SO_2 pollution of the atmosphere.

On the other hand, since the BH crude is light (this means a high distillate content which the country badly needs) and has low sulphur, it can be considered to be a premium quality crude. The naphtha fraction from this crude, being rich in aromatics and aromatic precursors, would form an excellent feedstock both for the production of premium grade motor gasoline as well as the production of aromatics such as benzene, toluene and xylenes. In fact, in the international market, this high aromatic naphtha would rate as a premium grade naphtha. Secondly, the low sulphur content of the crude offers several advantages, *viz* (i) less equipment corrosion, (ii) longer equipment life, (iii) lower maintenance costs and (iv) reduced environmental pollution.

Problems encountered

So far as problems that arise in its processing are concerned, they can be divided into three.

1. *Handling of crude and certain of the fractions*

Because BH crude had high pour point on account of its high wax content, the storage tanks that received BH crude had to be provided with steam heat coils. Similarly, the heavy ends, *i.e.* the bottom fraction of the crude which contained most of the wax had to be provided with similar heating coils. The lines handling the crude and these products had to be steam traced.

2. *Product specifications*

Because of the high aromatic content/wax content and low asphaltene content, several products such as ATF, fuel oil and solvents could not meet the market specifications. Even though, if the refinery had additional process units, jet fuel of satisfactory quality could be made, in the absence of such processing capacity, alternate means had to be found.

PACKAGE BOILER

Fig 1: Package boiler.

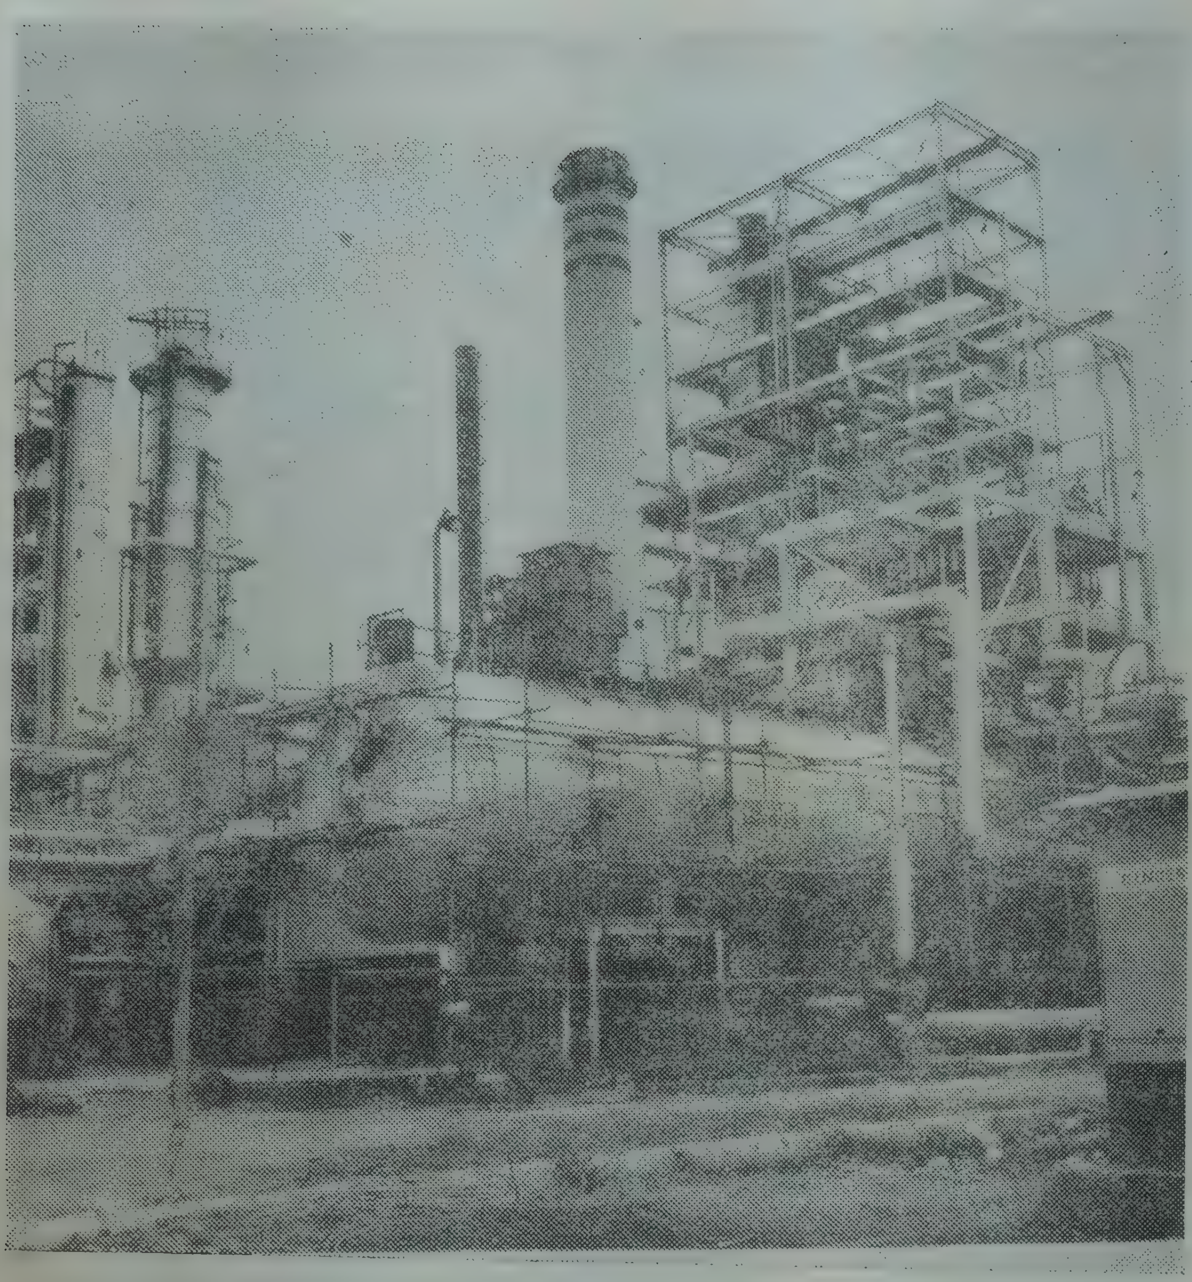

Fig 2: Electric desalter.

3. *Product pattern*

When BH crude was processed, it was found that the crude yielded a set of products considerably different from what an ME crude provided. Therefore, to maintain the original product pattern which, incidentally, was tailored to the requirements of the market, assistance had to be obtained from the next-door Hindustan Petroleum refinery which continued and continues to process Middle East crudes.

Modifications carried out

Since, as mentioned above, processing of BH crude in BPC refinery (which is designed to process ME crude) poses certain difficulties, steps were taken to implement certain modifications in the refinery and addition of certain facilities to overcome these problems. These were done with the refinery in operation and for convenience were carried out in three phases.

1. In Phase I, provision was made for heating of pipelines carrying this crude and all six tanks required for its storage. Steams coils were installed in these tanks and the pipelines were steam traced. A new oily water drainage and melting pit for the disposal of sludge ex-BH crude were provided in the crude tank farm. A package boiler to provide the additional steam (15 tonnes/hour, 15 kg cm^{2} — see Figure 1) and an electric desalter (see Figure 2) to remove water and salt from the crude were installed. Additionally, some reallocation of tanks was also made.

2. In Phase II, the remaining seven crude tanks were provided with steam coils, a second oily water drainage and melting pit for crude sludge provided, steam tracing of the remaining crude lines and certain product lines carried out, and new storage tanks and disposal facilities for a new product called low sulphur heavy stock (LSHS) provided. These included a new tank, new pumphouse (No 2A—see Figure 3), modifications to lorry loading gantry, a new weighbridge and another high pressure boiler of 30 tonnes/hour capacity.

3. Phase III. To restore the product pattern of the refinery as much as possible, it was decided to transfer certain fractions from the HPC refinery to the BPC refinery and give some fractions to HPC refinery for their operations such that both the refineries would benefit. For example, the HPC refinery would provide low aromatic naphtha suitable for naphtha cracker, raw fractions for producing solvents and bitumen. On the other hand, BPC refinery would provide cracker feedstocks and produce additional quantities of motor spirit which otherwise would have been produced in the HPC refinery. In the near future, in the same vein, additional quantities of ATF would be pro-

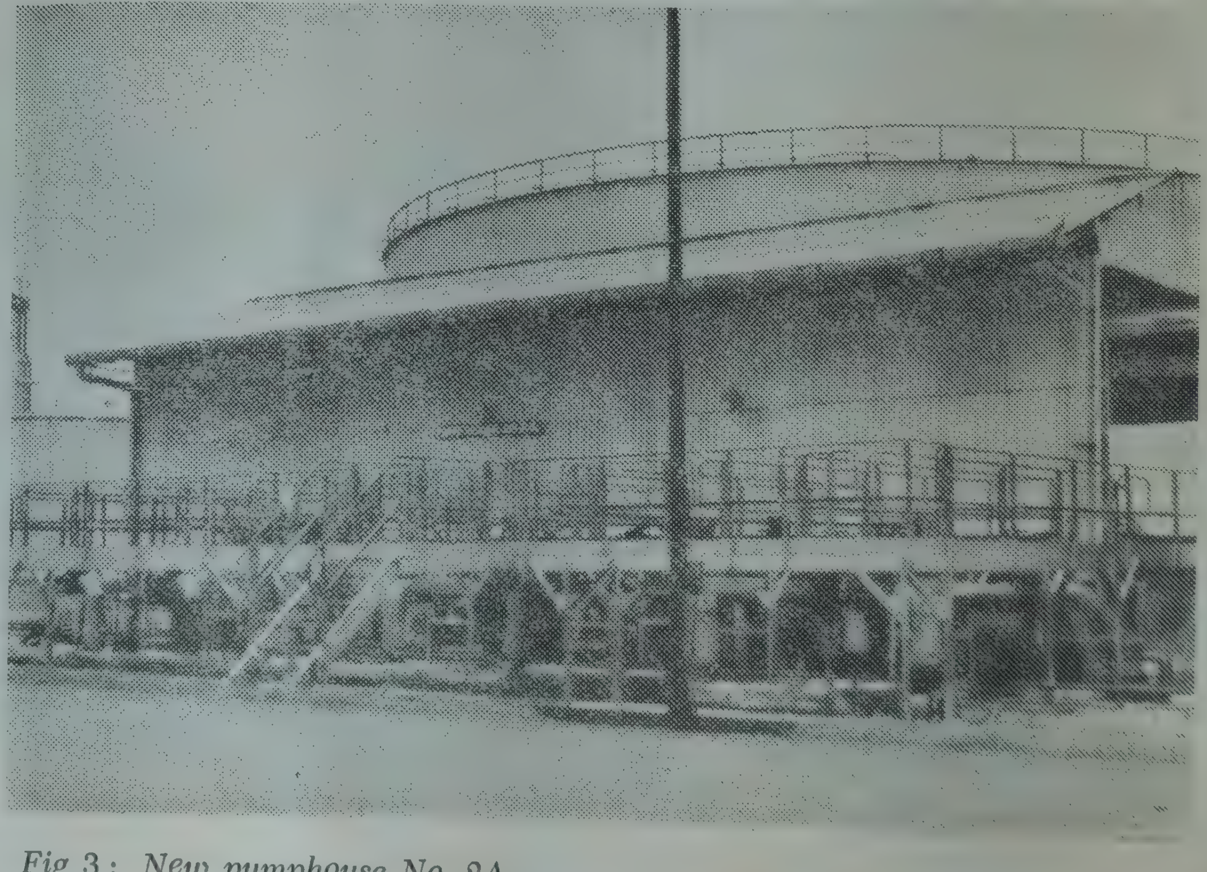

Fig 3: New pumphouse No. 2A.

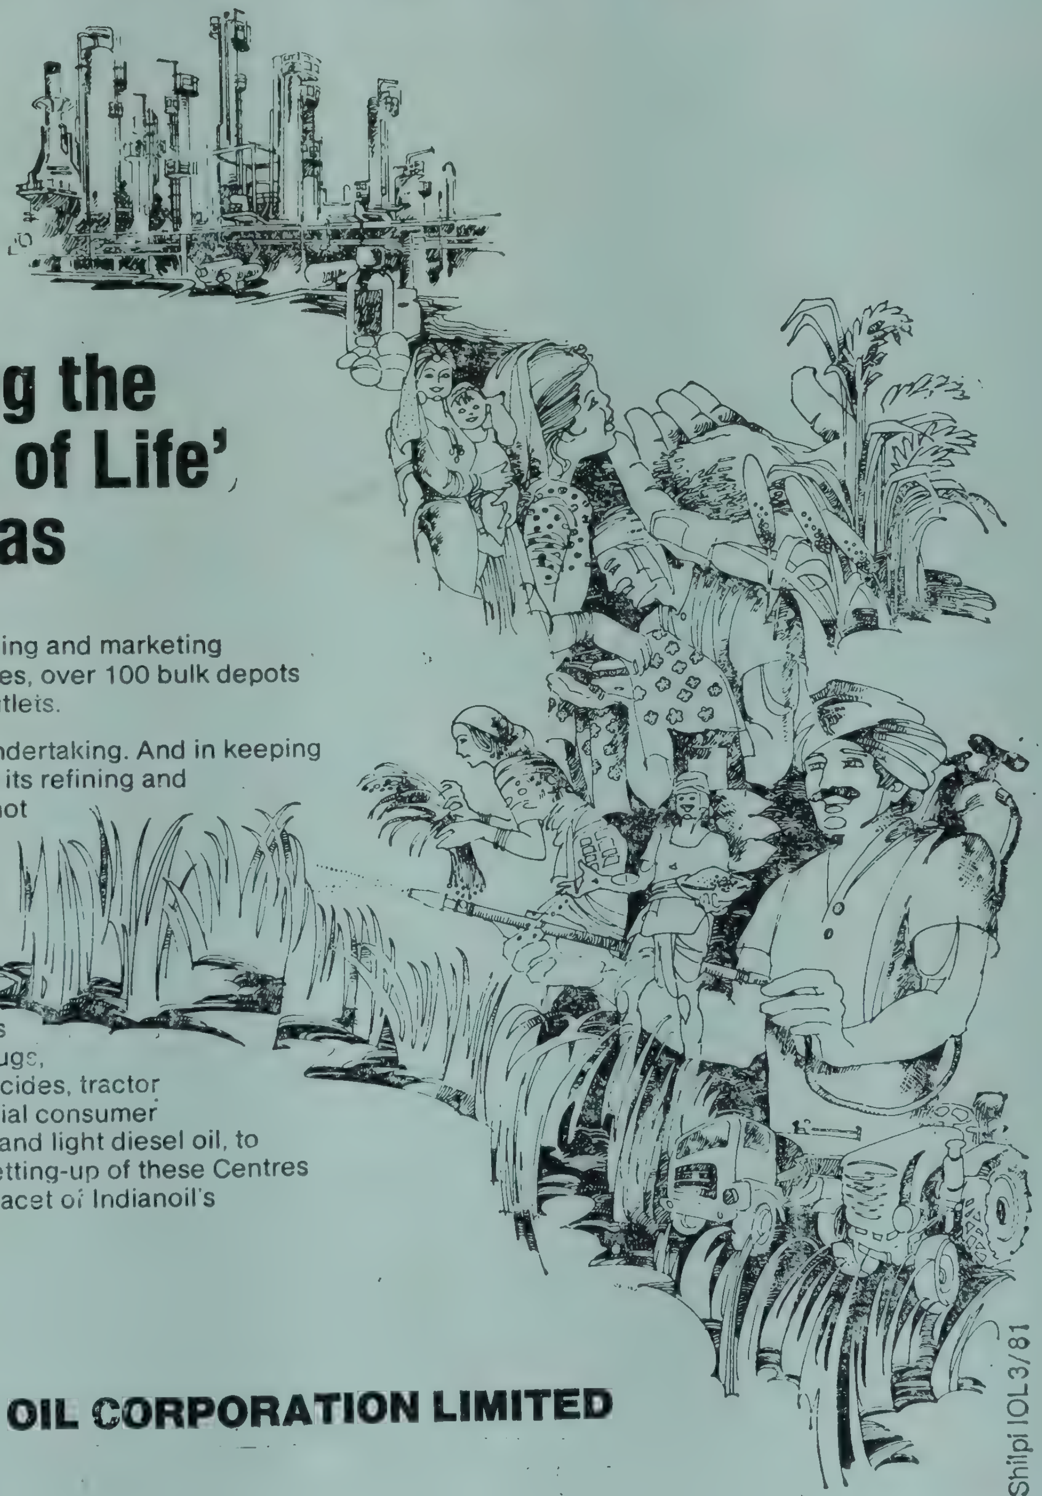
INDIANOIL

Supplying the nation with over 18 million tonnes of petroleum products a year...



And bringing the 'Essentials of Life' to rural areas

Indianoil. India's largest refining and marketing organisation—with 4 refineries, over 100 bulk depots and more than 4300 retail outlets.

Indianoil is a public sector undertaking. And in keeping with its role, it has expanded its refining and marketing facilities to meet not only the nation's industrial requirements but also the essential needs of the rural community.

Indianoil has set up over 300 ideally-located Multi-Purpose Distribution Centres—a ready source of basic drugs, cloth, fertilizers, seeds, pesticides, tractor spare parts and other essential consumer products, besides kerosene and light diesel oil, to villagers and farmers. The setting-up of these Centres in rural areas is merely one facet of Indianoil's socio-economic philosophy.

इंडियनऑयल **INDIAN OIL CORPORATION LIMITED**

duced by blending streams from both the refineries. One particular facility added is the transfer of Vacuum Tower Bottoms (VTB) from HPC to BPC for the production of bitumen. As mentioned above, BH crude cannot yield any bitumen. The BPC refinery, in turn, has added the necessary furnaces (see Figure 4) and steam trace pipelines.

Quantities processed

In summary, since BH and ME crudes are complementary in several respects, transfer of streams between the refineries would optimise the operations and product mix between the two and enable the requirements of the market to be met much better than otherwise. It is interesting to mention here that approximately Rs 8 crores have been spent during the last four years in modifying the BPC refinery to handle BH crude and also for transfer of raw streams, etc. BH crude actually processed by BPC refinery during the last five years is given beolw:

	Million tonnes
1976	... 0.16
1977	... 1.17
1978	... 2.52
1979	... 3.73
1980	... 3.29

Major projects under implementation

Since the BH crude provides excellent feedstock for the operation of a cat cracker to produce more distiller oils and motor spirit at the expense of heavier ends, the refinery is implementing a major scheme for the installation of an additional cat cracker. This scheme also includes necessary changes in the crude distillation unit to enable the refinery to process, if necessary, six million tonnes/year of BH crude which, incidentally, is the refinery's maximum capacity. Similarly, the refinery is progressing a project for the production of aromatic chemicals such as benzene and toluene.

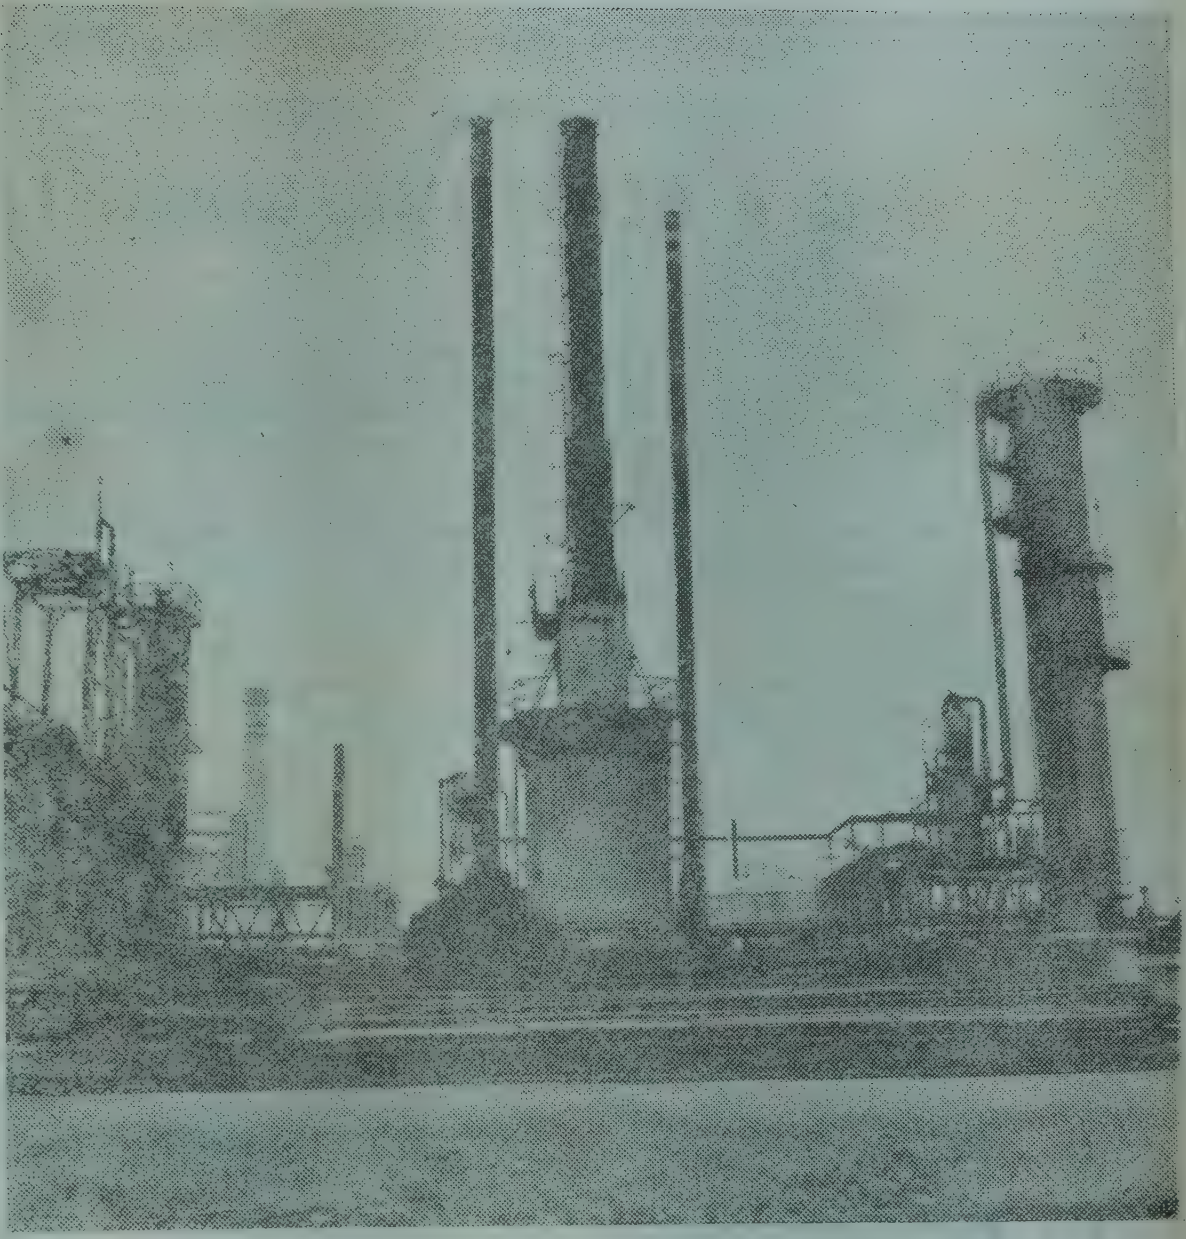

Fig 4: VTB furnace.

LPG from associated gas

Along with the production of BH crude in the offshore field, a certain amount of gas associated with this crude is also produced. This gas is compressed and sent by submarine pipeline to Uran, where a new gas processing plant has just been inaugurated. In this plant, the associated gas is separated into different streams, one of which is LPG. This LPG is then sent by an overland pipeline to the two Trombay refineries. BPC refinery has already set up facilities to store, fill and despatch this LPG. These facilities include three big Horton spheres (1,300 tonnes storage capacity each—see figure 5), a modern

HIDING IN THE BOWELS OF THE EARTH

IS A BEAUTIFUL, BLACK LIQUID-OIL

Bharat Heavy Electricals offers a wide range of equipment for Power Generation, Transmission and distribution and has enlarged its role steadily over the years and today it supplies specialised equipment and systems to meet specific industrial needs. The introduction of an exciting new range of oil field equipment, exemplifies BHEL's constant quest for new sources of power and energy.

These oil field equipment conform to American Petroleum Institute specification and in fact BHEL has earned the right to use the API monogram on its equipment. BHEL has already supplied sid rigs to Oil & Natural Gas Commission. The first one has been used by ONGC for wild-catting in Narsapur, Andhra Pradesh. This has struck gas holding out hope of oil find in the region. The second rig has also been deployed here.

BHEL rigs are presently being deployed in Assam, Gujarat and West Bengal also. To Oil India, BHEL has supplied a rig which was completely developed by it and capable of drilling upto 16000 feet. BHEL today is fully geared up to deliver a wide range of oil field equipment.

Drilling equipment for oil exploration

By **S. N. SHARMA**, *Engineering Development Manager (Oil-field Equipment), BHEL, Hyderabad*

THE oil and gas exploration started in our country in the year 1866 and the first producing oil-field was established in Assam. Soon after independence, in 1956 the Government of India established the Oil and Natural Gas Commission to carry out oil exploration activities throughout the country.

Because of global oil crisis of 1974, the Government of India decided to expedite the country's oil exploration programme to achieve self-sufficiency in this vital source of energy. The exploration activities were intensified throughout the territory of India, including offshore areas. Due to worldwide increase in demand of drilling rigs, a strong need was felt to establish manufacturing facilities for oil drilling rigs in India. Bharat Heavy Electricals Ltd (BHEL), a pioneer engineering and manufacturing organisation was entrusted with the responsibility of indigenously manufacturing diesel electric drilling rigs.

After an evaluation of technologies available in the world for design and manufacture of diesel electric drilling rigs, BHEL entered into a technical collaboration agreement with USS Engineers and Consultants, USA, for technical know-how of some of the vital mechanical components of the rig.

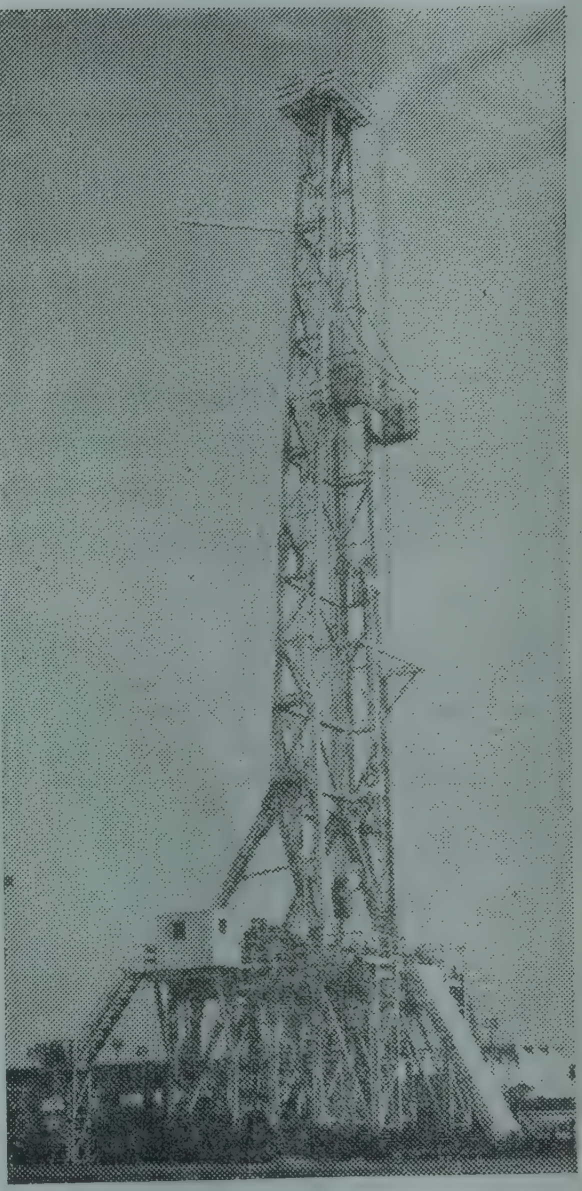
Today, BHEL is manufacturing draw-works, rotary, swivel and travelling blocks to USS Oilwell design, mast and substructure to Skytop Brewster design and mud system to HSMC design. The mud pumps supplied with BHEL rigs are also to USS Oilwell design manufactured by Bharat Pumps and Compressors Ltd, Allahabad, another Government of India undertaking.

The power pack and electrical controls for the rig were independently developed by BHEL with the expertise available within the company. In this task, CMRS and DGMS provided valuable guidance to make components of electrical system suitable for operation in hazardous atmosphere of oil fields.

The design and development of equipment for oil field application by adding new equipment to the product profile or by way of extending range of existing equipment has been a continuous process in BHEL. As a result E-1,400 type of rig has already been added to our product profile, in addition to E-2,000 and E-760 type of rigs for which design was obtained through technical collaboration. The development projects in hand for oilfield application include mast and substructure of 770,000 lb capacity, work-over and mobile drilling rigs and thyristor drive system for electrical controls. In this job of designing and developing new components and systems of oilfield application, the Oil and Natural Gas Commission and Oil India Limited have given immense help and provided useful information on functional and operational requirement of the equipment.

BHEL offers rigs suitable for drilling from 3,000 metres to 6,000 metres.

Continued on page 30

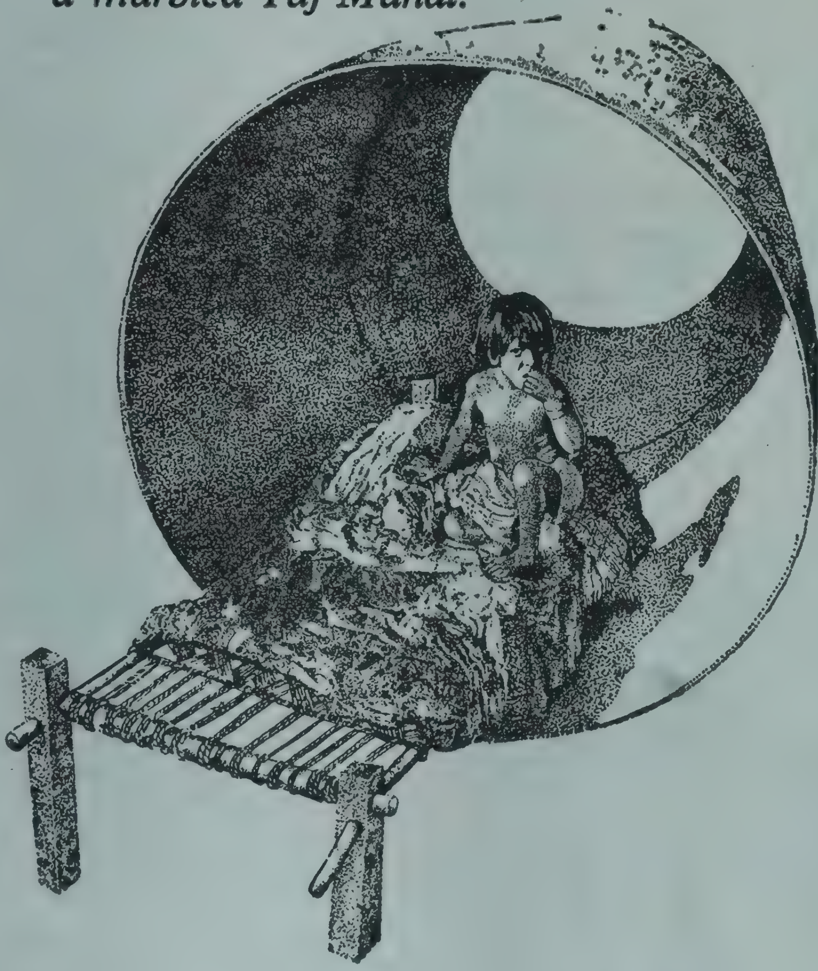


BHEL, Hyderabad, manufactures three types of oil rigs for drilling from 3,600 metres to 6,100 metres. The mast and substructure rise to a height of 51 metre.

The mast of an oil rig being elevated to its upright position.

Ours is a Magnificent Land-1

I sleep in the sewers
of my homeless cities.
But I have builded
a marbled Taj Mahal.



I hunger when famine
stalks the land.
But I have saved it
from plague and pox.

I taught my child
the arts of Science.
But I have seen him
forsake my shores.

I befoul my cities
because I will not plan.
But I have looked up
and discovered Quasars.

I see food hoarded
while my poor go hungry.
But I have made the
green revolution happen.

I never taught my children
to read nor write nor count.
But I have fathered
Nobel laureates.

I see my brother outraged
by my prejudice
But I have elevated him
to the highest office.

I flee from the farms
to the despair of my cities.
But I have held to the hope
of a hundred million jobs.

I was born to subsist
on a half-Rupee daily.
But I have died so my ashes
can enrich my loved India.

I am sad.
But I am glad.
I am.

Ours is a magnificent land.
We must build a
magnificent future. Think Ahead.

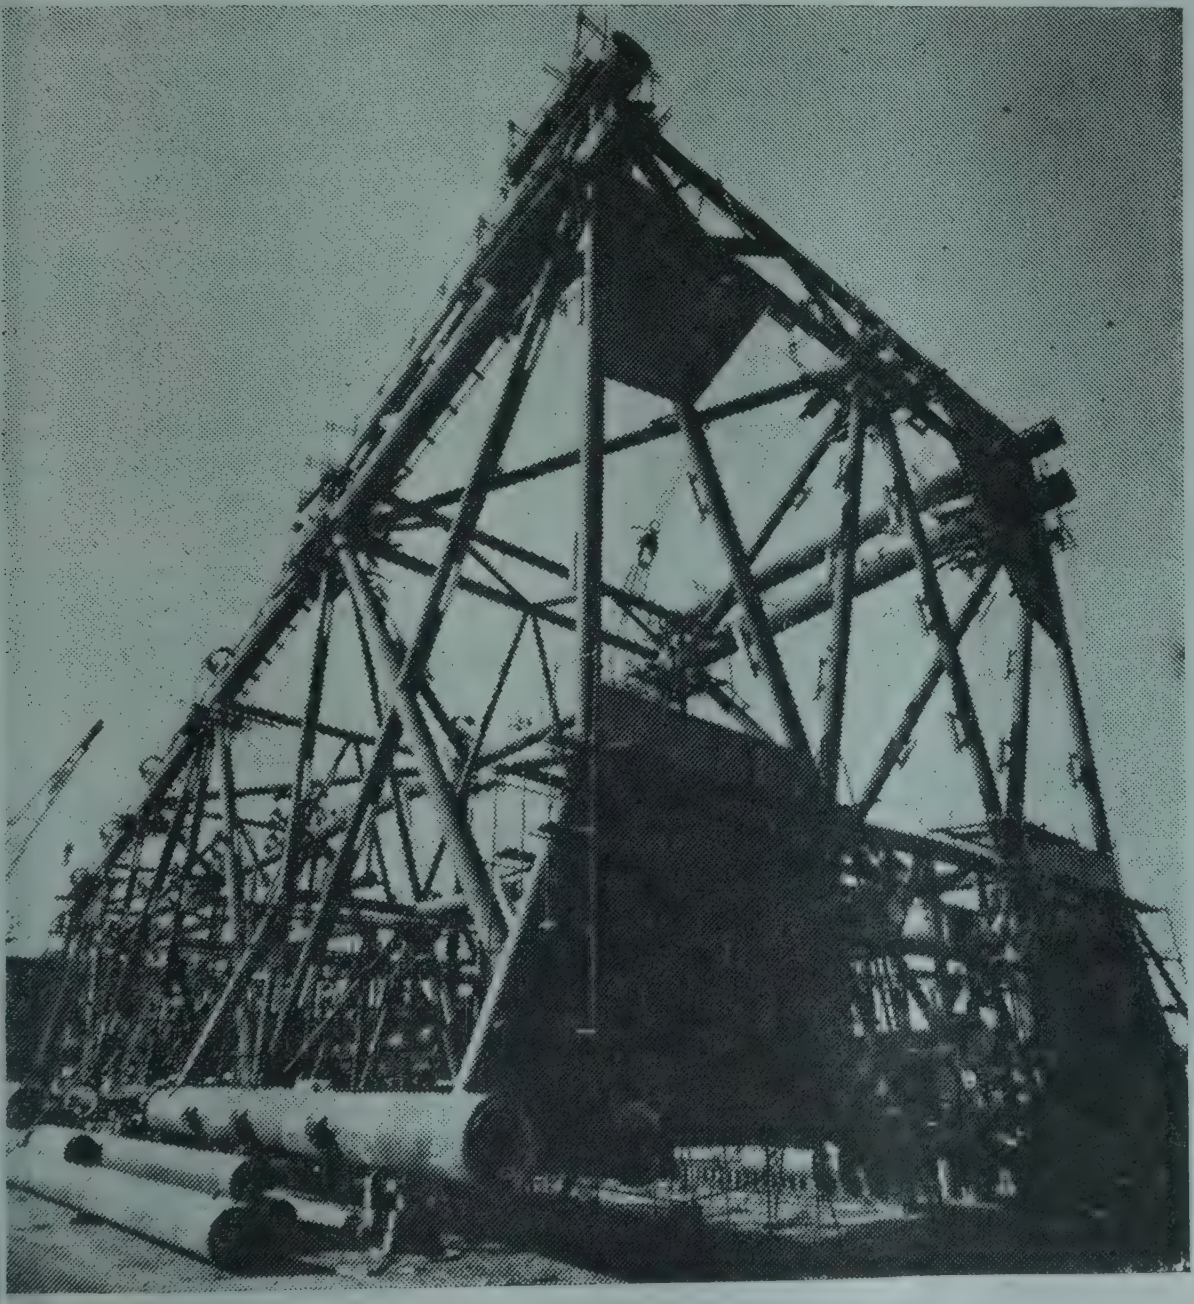
Fabricating offshore platforms

By **N. P. DUTTA,** *Crairman and Managing Director, Mazagon Dock Ltd.*

THE commencement of offshore exploration of oil in India by the Oil and Natural Gas Commission in 1973, with the drilling rig *Sagar Samrat*, marked the era of oil exploration in the Bombay High area, 80 miles off Bombay on the west coast of India. The ONGC has carried out extensive exploration work and, on the basis of their existing production programme, it is estimated that they would require about 40/50 additional platforms by April 1985. Mazagon Dock which has now gained experience in the manufacture of offshore platforms is gearing itself to meet a very major portion of requirements of ONGC.



Jacket of an offshore fixed platform under construction at Mazagon Dock.

Having struck oil offshore in sufficiently large quantities to justify large scale involvement in recovery and exploitation, the search was on to find a fabricator in India for offshore platforms. The major requirements of a fabrication yard of this nature are:

(i) Availability of an organisational infrastructure, managerial capabilities, technical and a highly skilled labour force conversant with heavy steel structural welding work to international standards which can stand up to the strict requirements of non-destructive testing.

(ii) Availability of water front with reasonable water depth to allow offshore vessels to ply to and fro and the proximity of this yard being again within economically justifiable distance from offshore exploration sites.

(iii) Availability of a large and well equipped fabrication yard equipped with heavy duty cranes.

Mazagon Dock was found to be eminently suitable as it has in abundance all the above mentioned requirements and also in view of its excellent performance and growth records.

The evolution of Mazagon Dock from a small shiprepair yard to India's leading shipbuilding yard makes a fascinating study in the history of shipbuilding in India. Set up in the 18th century, Mazagon Dock has maintained and improved upon its tradition of over 200 years of quality workmanship, speed and economy. In 1774 the first dry-dock called Mazagon Dry Dock was built. According to available records, Lord Nelson, the hero of the battle of Trafalgar, visited Mazagon Dock on board *HMS Sea Horse* in 1775-76. In fact some of the teakships built in Mazagon Dock took part in the battle of Trafalgar. Also, the oldest ship afloat today, *Foundroyant* is believed to have been built in Bombay in 1817.

The history of modern Mazagon Dock begins with its acquisition by the Government of India in 1960 and its development and modernisation for construction of large naval and merchant ships. Mazagon Dock can now build the most advanced vessels weighing up to 27,000 dwt. Mazagon Dock commenced construction of sophisticated Leander Class frigates in 1966 and so for has delivered five frigates to the Indian Navy. All these frigates are multirole combat vessels with anti-submarine, as well as surface-to-surface and surface-to-air capabilities.

Mazagon Dock has also now commenced construction of the first fully Indian-designed frigate, and Indian-designed coast guard vessels. Mazagon Dock has also constructed a luxury passenger-cum-cargo Liner *m. v. Harsha Vardhana* and a number of dredgers, barges and fishing trawlers.

MDL successfully entered the export market in shipbuilding, for the first time in India in 1974-75. Since then the company has built and delivered six general

A view of offshore project site of Mazagon Dock.

cargo-bulk carriers for the United Kingdom, two general coasters for Singapore, two large water tankers for Iran and over 100 barges for Iran, Saudi Arabia and Yemen. With this background of experience in shipbuilding, Mazagon Dock has built up a highly skilled cadre of personnel who were poised to take up heavy fabrication work like off-shore platforms. Hence, MDL took up manufacture of offshore platforms from the year 1978 as part of its diversification plans.

The manufacturing activity started simultaneously with the execution of the civil works project namely the construction of a launchway for pulling the platforms and a quay wall for loading out the jackets and decks. A fishing jetty situated just adjacent to the yard which was catering to the needs of the local fishermen was transferred to a different site. Mazagon Dock constructed a brand new jetty for the use of the fishermen while the original one was converted into a fabrication and erection area with a quay wall for load out of decks.

The fabrication yard is situated within close proximity to the finest port in India which facilitates easy and quick receipts of heavy steel plates, tubulars, and sophisticated equipment from all over the world. A 110 m long quay wall faces the waterfront with water depths of 4 metres below chart datum. The quay wall is designed to loadout a 2,000 tonne jacket and a 1,200 tonne deck. The 16 acre yard comprises six acres of covered shops and 10 acres open for erection fabrication and assembly area designed for an annual throughput of 12,000 tonnes. The shops are equipped with EOT cranes. The pipe cutting shop is equipped with two computerised Mueller-profile cutting machines for diameters ranging from 80 mm to 1,220 mm outside diameter which caters for the various complex geometrical profiles involved in TKY joints. One of the yard's greatest assets is a structural pipe rolling mill capable of rolling steel thickness up to 75 mm cold and in lengths of 3 metres. It is also equipped with semi-automatic external and internal welding booms for longitudinal as well as circumferential joints.

Two sets of pile rack system has been indigenously designed for the fabrication of large diameter jacket legs and piles in lengths of maximum 100 metres. It is equipped with four sets of semi-automatic submerged arc external welding booms. With a view to achieving higher productivity a wide range lifting equipment is provided which is capable of taking components, weighing up to 350 tonnes.

In our fully equipped welding school, highly qualified instructors have, for the past three years, successfully trained 250 welders who have been duly certified by Lloyds Register of Shipping Surveyors.

Seven platforms

Mazagon Dock has manufactured and loaded out seven platforms during the period 1978-March 1981 of which six have already been installed, complete with deck and helideck. We have already received works order for fabrication of nine more platforms. The platforms so far built are well platforms with the decks housing a range of sophisticated process, mechanical, electrical, electronic and telemetry equipment. The foreign exchange content of the equipment installed is in the region of Rs 16 million out of which Rs 4 million have been indigenised and a further Rs 4.5 million is in the process of indigenisation. Additionally Rs 6 million is being spent for import of steel.

Nhava yard

While the present yard can cater to four platforms per annum, the requirements of ONGC are 50 platforms up to 1985. Realising the need for increasing the production of platforms, Mazagon Dock has already acquired additional land at Nhava Island (off Bombay). A parallel fabrication yard in Nhava of 40 acres has been planned to cater for six to eight platforms per year totalling an annual throughput of 20,000 tonnes.

This yard is being designed for the fabrication of large steel jackets, construction and maintenance of drill ships, semi submerisibles, jack-up rigs, integrated decks, articulated columns and other large steel structures.

Eight acres of covered shop area has been planned, comprising pipe cutting, light and heavy engineering and pressure vessel, each having a clear span of 30 metres with overhead crane capacity of 125 tonnes. The pipe cutting mills is equipped with two computerised Mueller machines for cutting complex geometrical profiles.

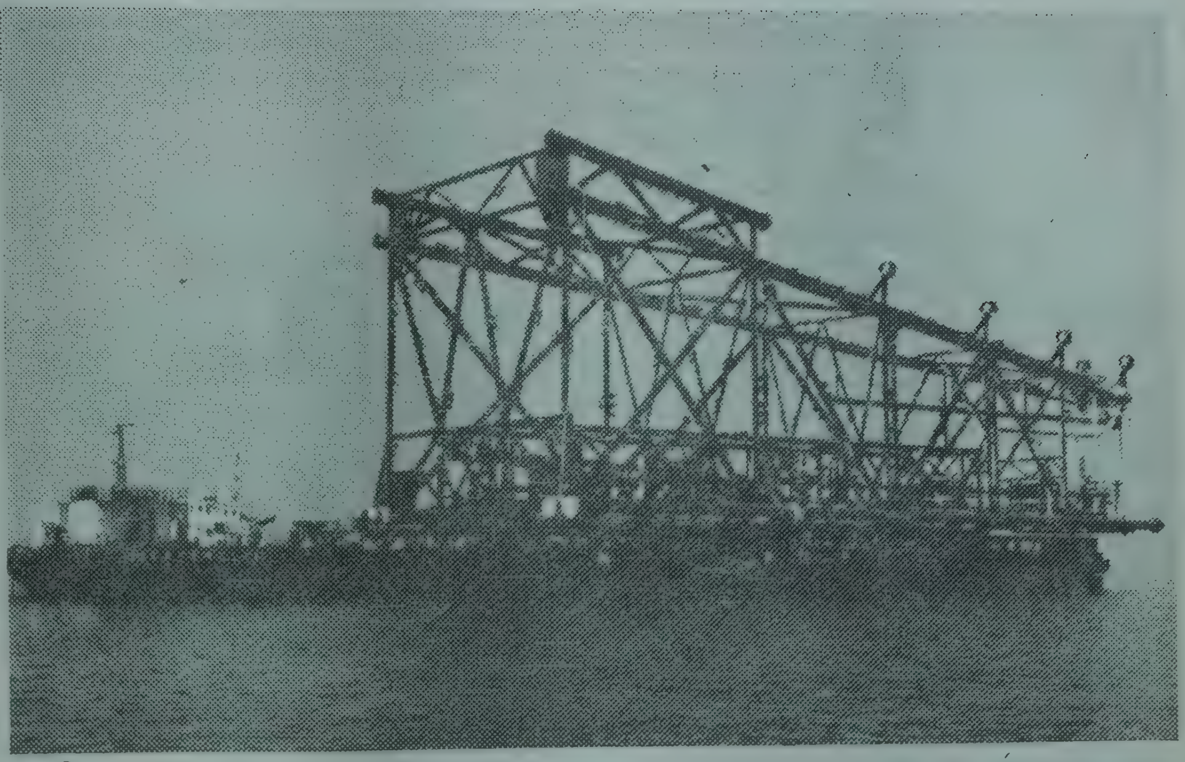
Pile rack system has been indigenously designed to cater for the fabrication of jacket legs and piles of large diameters in maximum length of 150 metres. Automatic submerged arc welding booms are fitted for external welding. Two gantry cranes of 35 tonne capacity are proposed to cater for loading, unloading and transportation of tubulars.

The yard houses four large crawler cranes of 225 tonnes maximum capacity each with material handling equipment. The yard is designed to loadout a jacket of about 6,000 tonne capacity. The quay wall has a total of 145 metres with a water depth of 8 metres below chart datum. This facility is expected to be commissioned by end of 1981. With the commissioning of the Nhava fabrication yard, Mazagon Dock will be able to deliver 12 platforms per year for the Oil and Natural Gas Commission.

Diversification plans

With the experience gained in fabrication of offshore platforms and with the skill and expertise built within the company in this field, the company is already in the process of diversifying/expanding its activities in the following related fields :

(a) Offshore maintenance and support services.



Jacket of an offshore fixed platform built by Mazagon Dock for the ONGC.

(b) Load out, transportation and installation of offshore structure.
(c) Diving cell,
(d) Research and development.
(e) Pressure vessels.

Offshore maintenance and support services

Another area which we have identified for diversification is development of offshore maintenance and support services, which is currently being contracted out by ONGC to foreign agencies. There is an ever increasing need for maintenance and support services for hook-up, repairs of equipment, supply duties, painting and preservation of offshore, NDT, cathodic protection, survey, etc.

We are planning to construct initially an offshore supply vessel for towing and anchor handling duties with capability also to act in the supply role. The vessel will be of a modern design with twin CPPS, round bilge form and be provided with bow trusters. We are also planning to construct a diving support vessel provided with saturation diving capability up to 200 m water depth, with an aeriated moonpool and provided with dynamic positioning.

We have also converted a 1,25,000 tonnes dwt tanker belonging to Shipping Corporation of India *M. T. Jawaharlal Nehru* into a storage-cum-export tanker, moored to an SBM. We fabricated and installed a large helideck on the tanker capable of landing helicopters of all up weight over 10 tonnes. We have recently been awarded the contracts for similar conversion of another tanker ***M. T. Lal Bahadur Shastri.*** We have also carried out structural modifications to some existing ONGC platforms.

The Oil and Natural Gas Commission is to acquire shortly a multipurpose support vessel, with saturation diving capability, heavy lift of 120 tonnes, with a helipad and fitted with a highly sophisticated dynamic positioning system with joystic control and redundancy. Mazagon Dock has been associated in the discussions for technology transfer for construction of follow-on vessels in India. We are hopeful of securing the contract for construction of follow-up multipurpose support vessels.

Load out, transportation and installation

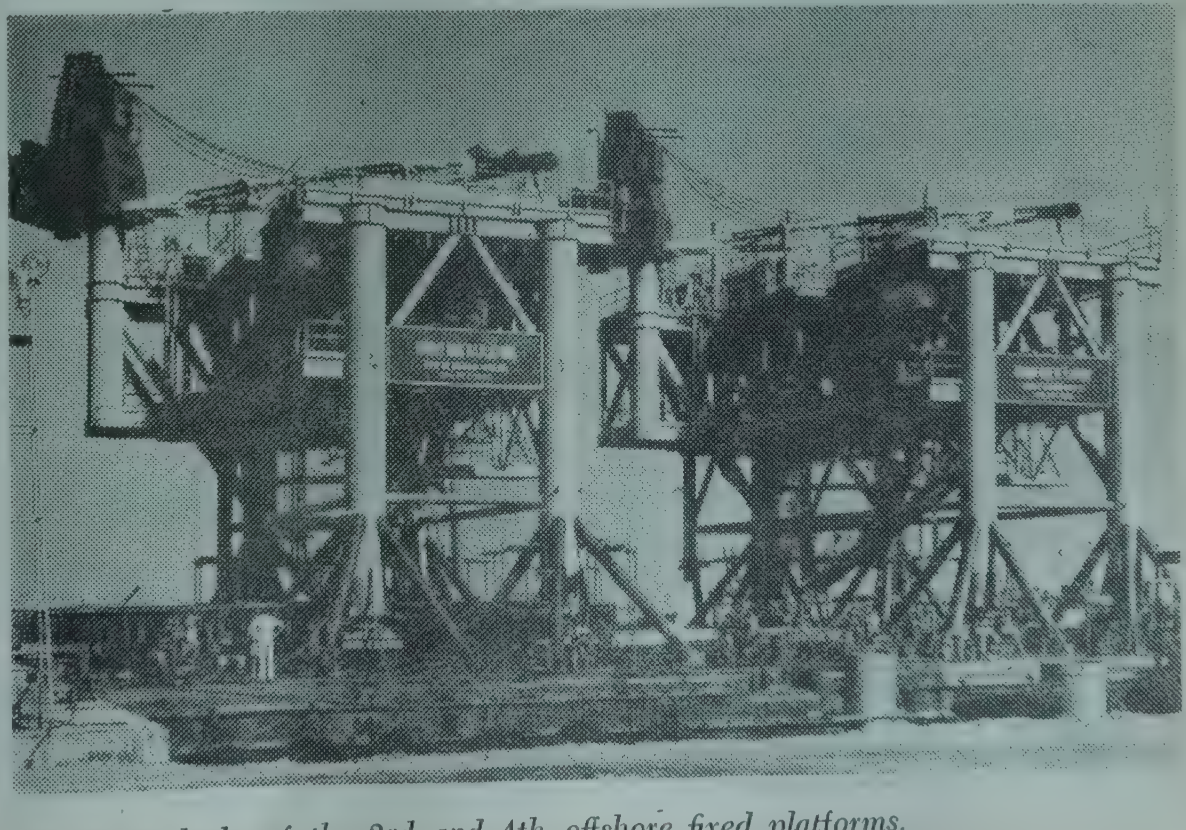
Load out, transportation and installation of offshore structures are feasible in the Bombay High area only from the month of October to end April. From May to September due to the south-west monsoon, environmental conditions preclude these operations. Presently, the load out, transportation, launching and installation of the platforms constructed by Mazagon Dock are entrusted by the Oil and Natural Gas Commission to specialist contractors. Mazagon Dock has decided to enter into this specialised area and made a beginning in 1980 by the design and construction of a cargo barge for load out of decks, modules, piles and other similar structures. The barge can be converted to use modules for working as NDT and repair boat, with some minor changes.

A jacket-launch barge capable of transporting and launching jacket weight up to 6,000 tonnes has been designed and is currently under construction. The launch barge is being built under the survey of American Bureau of Shipping.

We are also in the process of evaluating and purchase of a heavy lift derrick barge for installation and hook-up of offshore platforms. We are also exploring possibilities for technology transfer in transportation and installation of offshore fixed platforms and in-field pipelines. We have in our staff qualified masters of ocean-going vessels, chief engineers, deck officers and engineers, divers and qualified skilled labour force who can man the derrick barge after suitable initial training.

Diving

A team of qualified divers is a very necessary adjunct to offshore maintenance



The main decks of the 3rd and 4th offshore fixed platforms.

Offshore fixed platforms under construction at Mazagon Dock.

and support services. We have recruited highly skilled divers ex-Indian Navy and are building up a strong diving cell. We have entered into collaboration with M/s Wharton Williams for training our divers in execution of offshore diving work. We have recently entered into agreement with a UK firm Seaforth Maritime for fabrication and erection of saturation diving systems. We have also constructed habitat in ships for foreign contractors.

Research and development

The platforms we are constructing today are designed by Engineers India Ltd (EIL), another government of India undertaking and other foreign design agencies. We have set up an R and D cell to develop in-house capability in offshore platforms, design and related fields. The cell is presently developing computer programmes, including finite element programmes and static analysis of jackets and will eventually do dynamic and fatigue analysis. Programmes are being developed for analysis of loadout, launching and upending operations.

An Ocean Engineering Centre has been set up in the Indian Institute of Technology, Madras, by the Government of to carry out the research and development in this field and Mazagon Dock is actively interacting with the Centre. Our R and D efforts also cover underwater welding.

Pressure vessels

Mazagon Dock entered in the field of pressure vessel fabrication with the construction (in record time) of two large pressure vessels of 85 tonnes for feed gas dryers for the ONGC-LPG plant at Uran near Bombay. This job was done on a short notice on the request of ONGC, as the delivery of the items which was in hand with a reputed pressure vessel fabricator could not be met. Thus, in a big way, Mazagon Dock made an entry into the pressure vessel fabrication.

Future challenges

Presently, the commercial production of oil is concentrated in the continental shelf in the west coast of India off Bombay, where water depth is of the order of 70 to 90 metres. The ONGC is now exploring the possibilities of oil and gas production in a number of locations in the east coast of India and Andaman and Nicobar Islands. The oil here would have to be extracted from the continental slopes in water depths of 200 metres and above, which involves a totally different deep-water technology. This may involve tension leg platforms, articulated towers or semi-submersibles. The area is also prone to extreme cyclonic weather. This poses a new challenge which will be met in the course of time.

Technology transfer

India is a developing country with a vast pool of skilled technical and managerial manpower. Entry into areas of new technology hence inevitably will need the assistance of more experienced and specialised organisations. Offshore technology is a new and exciting field which charts virgin territories. We are fully aware that total self-sufficiency in this area is a myth. In any technology transfer selection, a stage comes when certain specialised areas have to be imported taking into account economies of large scale production and investments involved. Close economic and technical cooperation between the developed and developing nations in these field will immensely benefit both.

We in Mazagon Dock are gearing ourselves to meet the challenges of tomorrow.

Drilling equipment for oil exploration

Concluded from page 25

The specific requirements of the customer are taken care of in each rig. Thus, the rig as a whole does not have one standard specifications. Even for the same drilling depth, sub-assemblies of a rig may vary. The components supplied by BHEL on one rig are properly matched and the total rig is supplied as a well co-ordinated system.

BHEL has already supplied six diesel electric drilling rigs to the Oil and Natural Gas Commission and one to Oil India Limited. Some of the rigs supplied to ONGC have already worked in field for more than three years. These rigs have proved their reliability during critical drilling operation and have withstood extreme climatic conditions.

In BHEL, we consider that our efforts and contribution to the country's requirement of equipment for drilling industry is only in its infancy. With the rich experience gained in the field of oil exploration, we look forward to an even greater participation in the national and international market.

BHEL rig locator

Rig type	Nominal drilling depth rating with 4½" drill pipe	Customer	Rig location
E-2000 I	600 metres	ONGC	Narsapur, A.P.

E-1400 I	4900 metres	OIL	Duliajan, Assam

ONGC builds new supply base

By V. GOPAKUMAR

THE Oil and Natural Gas Commission is building a new and modern supply base on Nhava Island across the Bombay harbour. There has been stiff opposition from environmentalists who wanted the Nhava Island to be preserved as a green belt. Though on the face of it the environmentalists' concern sounded genuine, the real reason for their concern was that the Royal Bombay Yacht Club members would be deprived of excellent yachting facilities.

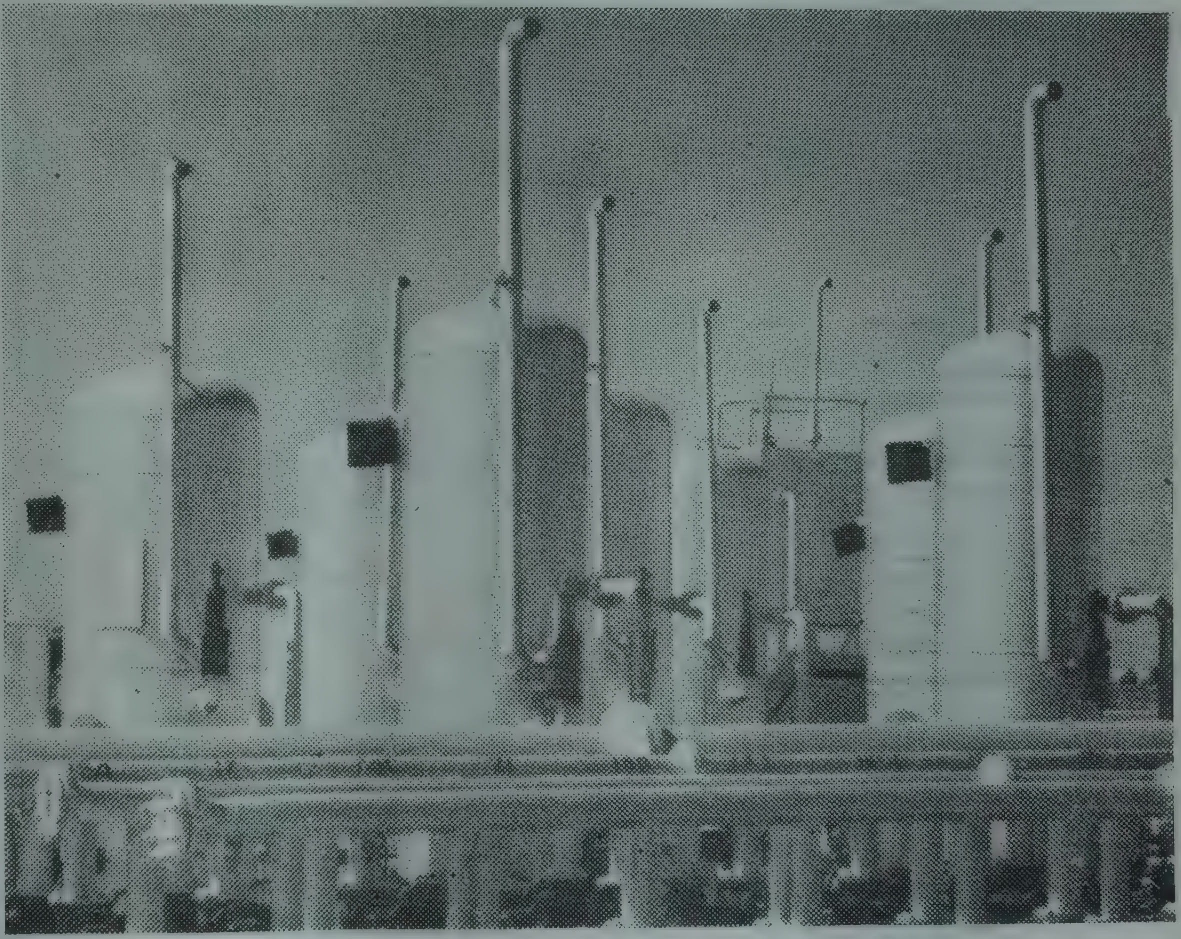
At present the ONGC has a supply base of sorts which has only bare minimum facilities. The ONGC has on lease from the Bombay Port Trust two berths which have a quay length of about 700' at 12 Victoria Docks. The ONGC acquired this facility in 1972 when it had only one rig — *Sagar Samrat* — and two supply boats. The number of rigs and supply boats have gone up and quantity of supplies has also increased several fold. On top of this, there are other problems like shortage of space for storing consumables and only two boats can berth at the same time. Apart from this, supply boats cannot come alongside during low tide for as many as ten hours a day.

The ONGC does not have space to keep supplies near the base and all the godowns are scattered all over Bombay. With Bombay's traffic problems and restrictions on heavy duty vehicle movement allowed only at night, getting supplies from godowns to the supply base itself has been a problem. Considering the increased needs and future requirement the ONGC decided in 1975 to build a new supply base. Nhava Island was selected because it is close to the Bombay High exploration zone and water depth during low tide enough for boats to come alongside.

Nhava Island is about two sq km in size. The ONGC has 50 hectares which is nearly one fourth of the island on lease from the Maharashtra Government. Adjacent to the supply base Mazagon Dock is getting up a new facility for fabrication of platforms for the ONGC.

In June 1976, the ONGC commissioned Peter Fraenkel & Partners as consultants to prepare a master plan for the development of Nhava base. Peter Fraenkel submitted its feasibility study and master plan in January 1977.

The ONGC would be operating about 40 supply boats and about 2 million tonnes of materials would be handled during the working seasons — September to May.



Group gathering stations.

Peter Fraenkel while designing the wharf has taken into consideration ONGC's plan for eight-rig operation and recommended five-berth capacity.

The supply base quay position and alignment have been selected to provide adequate water depth (about 24 feet) to ensure ease of berthing and to minimise maintenance dredging for supply boats drawing up to 5.5 metres. Passage is possible at low water for most supply boats on most tides and at high water for all boats on all tides. Apart from supply boats, there will be a number of vessels which may need to berth alongside for short periods, like seismic survey vessel, fire fighting boat, combination barge, general purpose boat, crew boat, water barge and drilling rigs (at high water only). Mobile diesel powered cranes of 100, 50 and 30 tonnes capacity, fork lift trucks and pipe carrying vehicles would be frequently plying on the wharf. Taking into consideration ONGC's warehousing needs, the consultant has provided part of the warehouse complex adjacent to the wharf and these warehouses will store spare parts, production equipment, bagged cement and chemicals. About 15,000 sq metres of covered space has been planned adjacent to the wharf. In addition, open storage area of eight hectares has been planned adjacent to the quay for stacking of well casing, drill rods and miscellaneous exploration and production equipment and another 10-18 hectares for storage of bare and concrete coated submarine pipes and one hectare for storage of chains, anchors, buoys etc. Diesel fuel storage and water storage for two weeks operation has been planned by providing tankers close to the base. Pipes would pass through ducts in the deck to valve pits and the quay face where flexible hose connections will be made for loading on to the supply boat. Fifty tonnes silos for pre-loading, storage of cement and drilling mud have been planned at each berth and loading of these materials on to the supply boats from the silos is by means of compressed air and will feed through pipes in ducts in the wharf to take-off points at the quay face.

Mazagon Docks new facility at Nhava will be able to fabricate and launch offshore jackets and platforms of 6,000 to 12,000 tonnes of steel/year. It also will have capacity to build six modules of 3,000 tonnes/year. Other facilities

Dodsal
congratulates
ONGC

on 25 years
of achievement

Thanks to the relentless efforts of ONGC, India finds its place on the oil map of the world.

Dodsal appreciates the opportunity given by ONGC to associate itself in constructing their many on-shore and off-shore facilities and particularly pipelines to move oil and gas.

With its accumulated resources of expertise...national and international field experience...over 5000 trained technicians with experience of working to international standards under varied conditions...and a wide variety of sophisticated modern construction equipment...Dodsal is well equipped to be associated with ONGC in its goal of making India self-sufficient in energy.

DODSAL looks forward to a continuing association with and service to ONGC.

Dodsal
helping move more oil

Dodsal Pvt. Ltd., Mafatlal House,
Backbay Reclamation, Bombay-400 020.

ADPLAN

at the Nhava base include 6,000 sq meter workshop, office building and offices and warehouses for equipment suppliers.

The detailed designs and preparation of tender documents for the marine works at Nhava were also carried out by Peter Fraenkel and Partners. The contract for construction was awarded to Essar Construction in March 1980.

The first caisson for the wharf was launched in November 1980, the second one in February 1981 and the third one is being launched. Each caisson is 34 x 17 meters and 55 meters high, weighing 3,000 tonnes. On completion the caisson will weigh 8,000 tonnes and when filled with granular material in position will be 18,000 tonnes.

The supply base will have an area of 52 hectares onland and 23 hectares reclaimed from sea. The first two berths will be available for operation by August 1982. The remaining three berths for the supply base, loadout quay, warehouses, dock buildings etc will be completed by March 1983.

Processing of Bombay High crude

Concluded from page 23

LPG bottling plant, tankwagon/tanklorry loading gantries and a pumphouse.

Pollution

Processing of Bombay High crude has provided the refinery with an excellent means of reducing pollution on account of low emission of sulphur dioxide. The refinery has taken particular care to use this low sulphur content residue from this crude as fuel in the refinery with the result that emission of sulphur dioxide from the refinery at present is about 22 tonnes/day as against 49 tonnes/day when the refinery was processing ME crude. However, with the addition of the new catcracker the emission would increase to 42 tonnes/day, but the refinery is implementing a major project for the recovery of sulphur such that the emission of sulphur dioxide would be brought down to 14 tonnes/day.

The modifications effected in the BPC refinery for the processing of Bombay High crude and the additional facilities provided, have been designed and built by the refinery personnel. They are naturally proud of this and look forward to implementing major projects now under way, which are designed to yield the maximum of desirable products from this crude in the national interest.

EASTERN INDIA TODAY

Lags in disbursement

By P. C. MAHANTI

CALCUTTA

THAT the eastern region has not been getting a fair deal from the public financial institutions is wellknown. What is perhaps not so wellknown is that disbursements do not match even the inadequate amounts being sanctioned. Indeed the gap between the two is noticeably large. Take the 1979-80 figures for instance. During this year the Industrial Development Bank of India sanctioned term loans totalling Rs 137 crores but disbursements came to only Rs 78.48 crores or less than 60 per cent of the total. The Industrial Credit and Investment Corporation of India sanctioned Rs 19.55 crores but disbursed only Rs 16.93 crores while the Industrial Financial Corporation disbursed Rs 10.82 crores out of a total sanction of Rs 12.11 crores. The pattern of disbursements and sanctions has been more or less the same over three previous years. The amounts of loans sanctioned has admittedly increased from year to year but the gap between the figures has persisted.

The gap lends substance to the complaint that the terms of the loans are unnecessarily rigid or they are too tight. First of all the current debt equity ratio although already raised to 2:1 from 1:1, is still considered restrictive by industry. Also insistence on a high rate of promoters' contribution in respect of loans for new companies creates difficulties for entrepreneurs. Interests of term loans are often unreasonably high, well in excess of 14 per cent. Conversion clause should be completely removed or alternatively the limit of 40 per cent in the total share capital suggested by the Union Finance Minister for the exercise of the conversion option by term lending financial institutions should include loans from all institutions and not a particular one which wishes to exercise the option. The soft loan scheme is not pragmatic enough to be popular with entrepreneurs.

These complaints could come from industrialists in any part of the country, north, south or west but from the eastern India point of view the proportion of loans sanctioned and disbursed has been steadily declining in relation to the national total. For example in 1976-77 the percentage of loans sanctioned for the eastern states (and these comprised not only Bihar, Orissa, Assam and West Bengal but Sikkim, Manipur, Meghalaya, Nagaland, Tripura and other union territories which constitute the northeast region) was 15.9 of the national total as far as the Industrial Development Bank was concerned; of the total ICICI loans the percentage was only 12.4 and of the IFCI loans the share was 10.1. Three years later the percentages declined to 11.2 for Industrial Development Bank loans, 9.2 for ICICI loans and 8.7 for IFCI loans.

Sick small units

West Bengal's Minister for Small Scale Industries, Mr Chittabrata Majumdar, had his point when he disputed the Central Industries Minister's observation that West Bengal had more sick small scale units than any other state in India on the ground that the latter had not seen the matter in its proper perspective and was therefore creating an entirely wrong impression about the state of small industries in the State. The Central Minister had stated in Parliament that West Bengal had 6,944 sick small units as against 2,763 in Maharashtra, 1,039 in Karnataka, 955 in Tamil Nadu and 856 in Gujarat. The West Bengal Minister would have liked Dr Chanana to give figures about the total number of small scale units in the above states and the circumstances under which they operated.

If West Bengal had the highest number of sick small units its number of small units also was the highest of any state in the country. He claimed West Bengal had 71,116 such units against 28,256 in Maharashtra, 15,627 in Karnataka and 24,189 in Gujarat. Thus only 9.77 per cent of the units in West Bengal were sick whereas the percentage in Maharashtra was higher —9.78. It is also worth noting that, between 1977 and 1979, 14,589 new small industries were set up in West Bengal as against only 3,225 in Maharashtra, 8,440 in Punjab, 6,616 in Gujarat and 4,577 in Karnataka.

The pity of it is that, despite this quick rate of growth in the small scale sector, the share in the allocation of pig iron and steel of which West Bengal is a major producer has been progressively diminishing. Most of the small units in West Bengal are engineering units which need pig iron and steel as their basic raw material. In the total allocation of pig iron in the country West Bengal just received 7.92 per cent in 1980-81 where Punjab, Gujarat and Uttar Pradesh received 25.72 per cent, 20.47 per cent and 14.99 per cent respectively. In absolute terms West Bengal received only 29,089 tonnes of pig iron against a requirement of 300,000 tonnes. In steel where West Bengal's requirement was 250,000 tonnes annually it received in 1980-81 only 36,400 tonnes. Maharashtra, Punjab and even Himachal Pradesh received more than their respective requirements.

In a situation of tight credit restraint the small industries in West Bengal have often to buy their requirements in the open market paying a high premium. In the circumstances if they could not operate economically and gradually get sick, it is the environment rather they which is to blame.

Power crisis

That the power crisis in West Bengal is 90 per cent man-made has been amply demonstrated by the shutdown on Santaldih power station, a major unit in the States' power system today. This superthermal power station had to remain completely shutdown for three days causing unspeakable difficulties for both industrial and domestic consumers, especially the former for whom the West Bengal Government immediately reduced supply. This shutdown was not because of tube leaks or other mechanical breakdowns but because the plant management did not take care to check how long the stock of light diesel will last. When it was detected it was already too late and prompt replacement was out of the question even though arrangements for transport by lorry from Calcutta were ordered. Just a few days ago workers engaged in coal unloading were creating trouble by slowing down their work and often not doing any unloading at all. At least that should have warned the management to check the diesel stock. The local management however, says it informed the higher bosses at the State Electricity Board headquarters in Calcutta a week before the diesel crisis but the latter apparently slept over the matter.

DOCUMENT

Text of new guidelines for bonus share issue

The following is the text of the new guidelines for issue of bonus shares, announced by the Controller of Capital Issues on August 18, 1981:

Under the Capital Issues (Control) Act, 1947, all companies require the prior approval of the Central Government through the Controller of Capital Issues for issue of bonus shares. Government have reviewed the existing guidelines in this regard and have decided to revise them in certain aspects.

The revised guidelines are given below:

1. There should be a provision in the articles of association of the company for capitalisation of reserves etc. If not, the company should produce a resolution passed at the general body making provisions in the articles of association for capitalisation.
2. Consequent to the issue of bonus share, if the subscribed and paid up capital exceeds the authorised capital, a resolution passed at the general body meeting in respect of increase in the authorised capital is necessary.
3. The company should furnish a resolution passed at a general body meeting for bonus issue before an application is made to the Controller of Capital Issues. In the general body resolution, the management's intention regarding the rate of dividend to be declared in the year immediately after the bonus issue should be indicated.
4. The bonus issue is permitted to be made out of free reserves built out of the genuine profits or share premium collected in cash only.
5. Reserves created by revaluation of fixed assets are not permitted to be capitalised.
6. Development rebate reserve/investment allowance reserve is considered as free reserve for the purpose of calculation of residual reserves test.
7. All contingent liabilities disclosed in the audited account which have a bearing on the net profit, shall be taken into account in the calculation of the minimum residual reserves.
8. The residual reserves after the proposed capitalisation should be at least 40 per cent of the increased paid up capital.
9. 30 per cent of the average profits before tax of the company for the previous three years should yield a rate of dividend on the expanded capital base of the company at 10 per cent.
10. Declaration of bonus issue in lieu dividend is not allowed.
11. The company may make a further application for issue of bonus shares only after 36 months from the date of sanction by the government of an earlier bonus issue, if any.
12. Bonus issues are not permitted unless the partly paid shares, if any existing, are made fully paid up.
13. No bonus issue will be permitted if there is sufficient reason to believe that the company has defaulted in respect of the payment of statutory dues of the employees such as contribution of provident fund, gratuity, bonus, etc.
14. Capital reserves appearing in the balance sheets of the companies as a result of revaluation of assets or without accrual of cash resources will neither be allowed to be capitalised nor taken into account in the computation of the residual reserves of 40 per cent for the purpose of bonus issue.
15. At any one time the total amount permitted to be capitalised for issue of bonus shares out of free reserves shall not exceed the total amount of paid up equity capital for the company.
16. Applications for issue of bonus shares should be made within one month of the bonus announcement by the board of directors of the company.
17. In case where there is any default in the payment of any term loans outstanding to any public financial institutions, a no objection letter from that institution in respect of the issue of bonus shares should be furnished by the companies concerned with the bonus issue application.

All applications for bonus issue should be signed by a person not below the rank of direct secretary, together with a certificate from the auditors of the company in the proforma as under shall also be furnished :—

"We have verified the information furnished by the company for issue of bonus shares and find the same as correct. We also certify that we have received all the information required by us for the verification.

We have certify that the proposal contained in the application for the issue of bonus shares meets all the requirements of the bonus issue guidelines, including the guidelines contained in paragraphs 8, 9, 11 and 13 in force issued by the Government in this regard according to the information furnished to us and to the best of our knowledge."

Interest rate dilemma

Concluded from page 374

bearing on the success of its economic strategy. Ministers have already called for settlements well below the current average of ten per cent. Since this would mean a cut in living standards, trade union leaders have responded angrily, but with Britain still at the bottom of the recession their members may not be prepared to price themselves out of jobs.

However, although adult unemployment rose by a further 30,000 in the month to mid-July, and school-leavers pushed up the "headline" figure of total unemployment to 2.85 million, the rate of increase has slowed dramatically during the last three months. The Government has also announced a £700 million package of new job support measures, which should take at least 460,000 people off the unemployment register by the spring of 1983.

Ministers can at least take comfort from the continuing gentle decline in the rate of inflation. In the month of mid-June, the year-on-year increase in the retail prices index edged down to 11.3 per cent and lower inflation remains the cornerstone of the Government's policy.

MONSOON, CROP AND COMMODITY SURVEY: JULY 1981

The continuing menace of floods

By COMMERCE RESEARCH BUREAU

THE progress of the south-west monsoon was satisfactory during July. However, heavy rains caused floods over large parts of the country. At the same time, a few areas were affected as a result of scanty rains. Overall crop position was good and there appeared to be little reason to doubt that the target of 83 million tonnes set for kharif foodgrains would be achieved.

During the period June 1 to July 29, 1981, of the total 35 meteorological sub-divisions rainfall was good (excess or normal) in 31 sub-divisions covering 91 per cent of the population and 89.3 per cent of the net sown area as compared to 32 sub-divisions covering 92 per cent of the population and 95 per cent of the net sown area during the corresponding period last year. Rainfall was deficient in four sub-divisions accounting for nine per cent of the population and 10.7 per cent of the net sown area as compared to three sub-divisions accounting for eight per cent of the population and five per cent of the net sown area in the same period of the preceding year.

Eleven States were affected by floods as a result of widespread and excessive rains. These were Assam, Bihar, Gujarat, Haryana, Jammu & Kashmir, Kerala, Madhya Pradesh, Punjab, Rajasthan, Uttar Pradesh and West Bengal. The States worst affected by floods were Assam, Bihar, Rajasthan and Uttar Pradesh. The floods took a toll of 390 lives. The population affected was over 11 million in 67 districts. About 14,400 villages were hit by the floods and the total loss in terms of crops, property, etc was estimated at Rs 157 crores. The cropped area affected was about 10 lakhs hectares while 4,000 cattle were lost. Fresh floods were reportedly threatening Assam, Bihar and Uttar Pradesh at the end of the month.

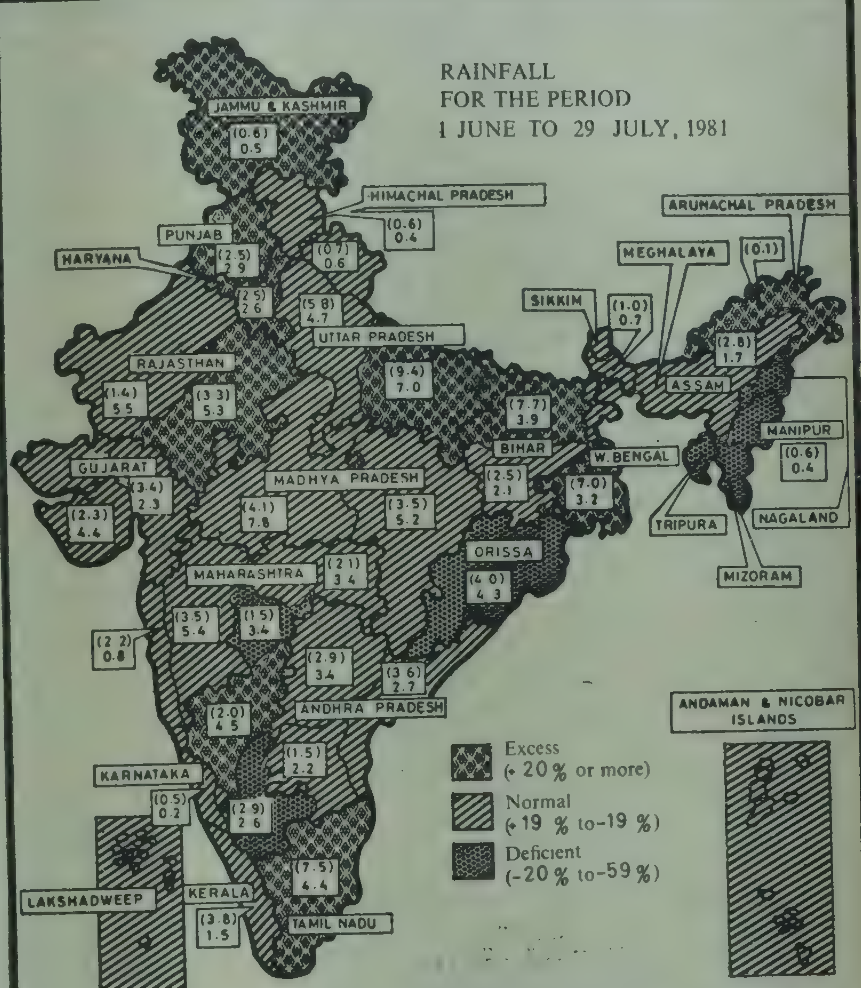
The States affected by drought in certain parts were Karnataka, Maharashtra, Orissa and Tamil Nadu. The Chhatisgarh region of Madhya Pradesh as well as some parts of Haryana also suffered from drought. As a result, crops were badly affected and there was large-scale unemployment of agricultural labourers. Scarcity of driking water was also felt in some parts of the affected regions. Measures for relieving unemployment and drinking water scarcity were undertaken.

The Agricultural Prices Commission (APC) which had recommended the procurement prices of kharif cereals for 1981-82, was directed by the Centre to recommend revised prices taking into account the rise in prices of fertilisers announced in July. The APC has recommended the revised price of Rs 115 per quintal for common variety of paddy against the previously recommended price of Rs 113 per quintal.

The rice procurement during the 1980-81 kharif marketing season was 5.6 million tonnes, about 50 per cent more than last year's 3.7 million tonnes. Wheat procurement in the rabi marketing season was, however, only about 6.4 million tonnes. The foodgrains stocks with the Government as on July 26, 1981 were 13.5 million tonnes comprising of 7.5 million tonnes of wheat and six million tonnes of rice—a million tonnes lower than the stocks of 14.6 million tonnes at the end of July 1980, the composition last year being 8.1 million tonnes of wheat and 6.5 million tonnes of rice. The Government of India decided to import wheat to meet the domestic shortage. As a part of the import programme it contracted for import of 1.5 million tonnes of wheat from the USA. The International Wheat Council, London estimated India's wheat import requirement as four million tonnes for 1981-82.

Progress of Monsoon

RAINFALL
FOR THE PERIOD
1 JUNE TO 29 JULY, 1981



NOTE: The figures in brackets in each square indicate percentage of the total population (1971) and figures outside the brackets indicate the percentage of the total net sown area (1971-72) in the regions.

Commerce Research Bureau

Map not drawn according to scale

Apart from the import of two lakh tonnes of sugar, the Government also decided to import edible oils and cotton to meet domestic requirements. It was proposed to import five lakh tonnes of edible oils through the State Trading Corporation apart from imports on private account. The imports were expected to keep the skyrocketing prices of edible oils in check. As regards cotton, the shortage of short and medium staple cotton faced by the textile industry forced the Government to import one lakh bales of these types from Pakistan. The imports would be canalised through the Cotton Corporation of India. Due to increased production of long and extra-long staple cotton and the comparatively lesser domestic demand, the Government permitted the export of these types including Varalaxmi and Suvin.

The following paragraphs present the Statewise and cropwise position for the month of July 1981.

ANDHRA PRADESH

Up to the end of July the state experienced normal rainfall in two meteorological sub-divisions namely coastal Andhra Pradesh and Telangana while in Rayalaseema it was slightly below normal. The State expected a foodgrains production of 104 lakh tonnes in 1981-82 as against 100 lakh tonnes in the previous season. Rice production was expected to be 69 lakh tonnes.

The Andhra Pradesh State Trading Corporation would export 90,000 tonnes of rice (coarse and fine varieties) to the Soviet Union during the current financial year.

Under a World Bank aided project, seven regional agricultural research stations would be established in the State, one each in the seven agro-climatic zones in the State. The World Bank has allocated a sum of Rs 6 crores under the National Agricultural Research Project of the Indian Council of Agricultural Research (ICAR) over a period of five years. The research stations would be established and operated by the Andhra Pradesh Agricultural University.

The State Government formulated schemes with an outlay of Rs 100 crores to uplift 1.2 lakh scheduled caste families above the poverty line during the year 1981-82. The schemes under the National Rural Employment Programme (NREP) would also form part of the overall programme and would involve an outlay of Rs 16 crores.

ASSAM

The State faced three waves of floods during the monsoon so far. Twentyone persons lost their lives and about 100 head of cattle perished due to the floods which affected seven lakh persons in eight districts and damaged crops over 22,000 hectares. The worst affected districts were Sibsagar, Lakhimpur and Kamrup. The Prime Minister sanctioned Rs 5 lakhs from the National Relief Fund for flood relief in the State.

BIHAR

Floods engulfed 3,000 villages in eleven districts of the State. A population of 32 lakhs was affected by the floods which claimed 15 lives. Crops in an area of 3.66 lakh hectares were damaged. The crop loss was estimated at Rs 9.04 crores. The total loss of crops and property was placed at Rs 64 crores. The Ganga, the Mahananda, the Buri-Gandak, the Kosi and three other rivers were in spate eroding their banks in Katihar, Purnea, Saharsa, East Champaran and Nalanda districts.

As a part of relief operations the State Government set up 410 relief centres, 411 health centres and 265 cattle relief centres. Over 2,871 quintals of foodgrains were distributed as gratuitous relief. The State asked the Centre for an assistance amounting to Rs 25 crores.

It was proposed to set up 100 mini soil testing laboratories in the State during the current financial year to ensure proper application of fertilisers. Fertiliser consumption during 1981-82 was expected to rise to 2.80 lakh tonnes as against 2.05 lakh tonnes in 1980-81.

GUJARAT

Flash floods during the month claimed 50 lives and affected 40,000 people in 116 villages in six districts. As many as 18 dams in the Saurashtra region were reported to be overflowing, thus threatening the neighbouring areas. The total damage was placed at Rs 51 lakhs.

A Rs 120-crore master plan was prepared by the State Government to control floods and also to prevent the erosion of farm lands by flood waters.

The Centre allocated 6,000 tonnes of palmolein for August 1981, 500 tonnes more than the allocation for July. The palmolein would be distributed through fair price shops in August.

The Gujarat State Co-operative Marketing Federation agreed to supply about 6,000 tonnes of groundnut oil to the State Government for distribution among the weaker sections of society through fair price shops during the Janmashtami festival.

HARYANA

The floods caused by heavy downpour in some parts of the State affected 26,000 people in 62 villages and claimed three lives. The loss in terms of crops, property, etc was placed at Rs 10 lakhs.

However, scanty rains in other parts such as Karnal, Kurukshetra and Sirsa were reported to have affected the prospects of kharif paddy crop. The bajra crop was reported to be shaping well and the production was expected to be five lakh tonnes as against 4.84 lakh tonnes in 1980.

The State Government assured adequate power supply to paddy sowing areas in the State.

The State Forest Department planned to develop clusters of eucalyptus groves under the Integrated Rural Development Programme. The groves would be planted free of cost on the lands of marginal farmers owning up to one hectare of land. The Department proposed to plant 400 healthy eucalyptus plants on each farm.

The State lifted the ban on the manufacture of milk products in the State with effect from July 3, 1981.

India's first factory to delint cottonseed with the help of acids would be set up in the co-operative sector at Hisar. The finance and expertise would be provided through the National Seed Development Corporation of the United States.

HIMACHAL PRADESH

Heavy rains and cloudburst were reported to have caused damage to the standing fruit crop worth Rs 16 lakhs in Chamba and Kangra districts.

The Himachal Pradesh Horticulture Produce Marketing and Processing Corporation initiated a programme for marketing of bumper apple and other crops this season. Thirty centres were opened for sale of fresh fruits and a network of packing and grading houses and transhipment centres was set up for collecting, grading and packing of fruits.

JAMMU & KASHMIR

Flash floods caused by the tributaries of the three rivers — Tawi, Chenab and Jhelum — claimed ten lives. About 1,000 houses in the Jammu region were partly or completely damaged. The rain also affected paddy transplantation all over the State.

The Centre agreed to ban the import of hops to promote its cultivation in the State. The area under hops had doubled from 150 hectares in 1980 to 300 hectares in 1981.

KARNATAKA

Owing to scanty rainfall during the month, drought threatened six of the 19 districts of the State. Standing kharif crops were reported to be withering due to lack of soil moisture.

The target for kharif foodgrains production for 1981-82 was placed at 68 lakh tonnes.

The State Government raised the price of milk supplied by the Government dairies by 40 paise per litre with effect from August 1, 1981. The new price of milk would be Rs 2.10 per litre as against the previous price of Rs 1.70 per litre.

KERALA

The State asked the Centre's permission to purchase rice from any part of the country as the Food Corporation of India in its opinion had failed to honour its commitment to meet the State's shortage of rice.

The Centre's decision to import coconut oil led to a steep fall in the price of coconuts and coconut oil in the State. The State-owned Coconut Development Corporation purchased about 2,000 tonnes of copra to ease the situation in the wake of the price fall. The State Government urged the Union Government to stop the import of coconut oil forthwith.

MADHYA PRADESH

The State Government abolished the levy on sale or purchase of wheat by

Figures of rainfall for Assam include also those for Meghalaya

traders within the State. The levy on wheat for sale outside the State would however remain in force.

Both floods and drought affected the State during the month. While the Narmada inundated areas around Nemawar in Dewas district, drought loomed large over the Chhattisgarh region—the rice bowl of the State. The condition of the standing paddy crop was reported to be critical. Agricultural operations were incomplete in Raipur, Durg, Rajnandgaon and Bastar districts.

The State Government proposed to introduce group insurance scheme for major crops in 20 selected tehsils in 12 different agro-climatic zones on an experimental basis. The farmers would be insured up to Rs 2,000 if they secured credit from banks for farm inputs. Premium would vary from five to ten per cent of the average value of crops.

Under the kharif campaign initiated by the State Agriculture Department 12,500 quintals of seeds were distributed together with fertilisers. An additional area of eight lakh hectares would be brought under kharif crops in 1981-82.

Increase in soyabean production was a significant part of the kharif programme of the State for 1981-82. Soyabean output, which was 3.5 lakh tonnes last year, was estimated to go up to seven lakh tonnes this year.

MAHARASHTRA

While most parts of the State received normal rainfall, the Marathwada region and Ahmednagar and Solapur districts suffered due to scanty rainfall. Scarcity of drinking water was being experienced in 643 villages of the Marathwada region and 100 villages of Shrirampur taluka in Ahmednagar district. The availability of water in 156 minor irrigation and 24 medium tanks in Marathwada region was below 25 per cent while the kharif crops in six lakh hectares were affected. Sowing and transplanting operations were in full swing in the rest of the State.

The kharif foodgrains output was targeted at 68.7 lakh tonnes for 1981-82, mainly comprising 23 lakh tonnes of rice and 34 lakh tonnes of jowar.

A committee headed by the Chief Minister would be set up to review the rainfall and crop position in all districts of the State and take appropriate measures.

The State Government decided to set up a corporation to develop horticultural estates in the State. The total capital requirement of the corporation would be Rs 15 crores to Rs 20 crores of which the State Government's contribution would be Rs 5 crores. The balance would be contributed by the co-operative and nationalised banks and Agricultural Refinance and Development Corporation.

With a view to extending various facilities and concessions, the State Government widened the scope of the definition of small and marginal farmers which would benefit 15 lakh farmers in non-irrigated areas. The ceiling for small farmers was extended up to six hectares and/or those farmers paying an annual cess of Rs 15.

Milk consumers under the Government milk scheme in Greater Bombay would pay Rs 5 per litre for whole milk from August 1, 1981 as against the previous price of Rs 4.30 per litre. The price of standard milk was raised by 40 paise to Rs 3.30 per litre. Corresponding price rises were also announced for other areas served by the Government milk schemes. The rise was necessitated by the State Government's decision to pay the milk producers additional 20 paise for cow milk and 40 paise for buffalo milk per litre from that date.

The Centre agreed in principle to allow the State Government to continue for one more year the monopoly cotton procurement scheme provided it did not ask for funds from the Reserve Bank of India and that it gave more benefits to the cotton cultivators. The Centre also wanted the Cotton Corporation of India to be given a role to play in the operation of the scheme. It may be recalled that the period of operation of the scheme had expired on June 30, 1981 and the State Government had requested the Centre for its sanction to continue the scheme for ten years.

MANIPUR

The State Government earmarked a sum of Rs 1 crore during the current financial year for giving incentives to growers of pineapples, oranges and lime. In May 1981, the Manipur Fruit Processing and Cold Storage Co-operative Society Ltd despatched 30,000 tins of canned pineapples worth Rs 1.90 lakhs to Kuwait.

The Reserve Bank of India, in consultation with the Centre and the State Government constituted a study team to suggest measures to improve the working of agricultural credit institutions in the State.

ORISSA

Drought gripped seven districts — Bolangir, Sambalpur, Kalahandi, Sundargarh, Koraput, Dhenkanal and Ganjam— in the State. Agricultural operations in these districts had come to a standstill.

The State sought an additional allotment of 30,000 tonnes of foodgrains from the Centre for implementing the National Rural Employment Programme. The State allotted 10,000 tonnes of rice from its own stocks for the programme.

According to the Chief Minister of the State the foodgrains production during 1980-81 reached an all-time high of 60.47 lakh tonnes.

The State's target for kharif cereals production for 1981-82 was fixed at 48.5 lakh tonnes and that for pulses at 1.60 lakh tonnes.

PUNJAB

The weak monsoon up to July 20 led agricultural experts to fear that the higher targets set for kharif production in 1981-82 may not be achieved except for cotton. Late sowing of paddy was expected to affect the yield. The target for paddy production was fixed at 34 lakh tonnes as against 32 lakh tonnes last year.

Widespread rains lashed the State during the second fortnight of the month causing flash floods in 200 villages, killing four persons, affecting a population of 0.5 lakh and a cropped area of 0.47 lakh hectares. The total loss was put at rupees one crore.

The Cotton Corporation of India (CCI) would purchase 3.5 lakh bales of cotton in Punjab in the coming cotton season as against 2.75 lakh bales purchased last year.

The Punjab Cooperative Supply and Marketing Federation would construct 200 godowns of 10,000 tonnes capacity each at 42 different places in the State.

Stress was being laid by the State Government on the production of pulses in the State. With a view to increasing the production of pulses in the State, 64,000 hectares would be used for the cultivation of pulses during the current kharif season as against 54,000 hectares last year. The production target for kharif was placed at 42,000 tonnes as against 35,000 tonnes last year.

The State Government appointed a three-member panel under the chairmanship of the Milk Commissioner to review the milk prices in the State every four months. The State Government announced an increase of 25 paise per litre in the purchase price of milk by the Punjab Dairy Development Corporation with effect from July 1, 1981.

The State Government decided to set up a commercial afforestation corporation for curative afforestation for the water-logged areas and also to promote commercial forests in government and private land to supply raw material to the proposed paper mills to be set up in the State. The proposed corporation, in co-ordination with the Punjab Forest Department, would develop a perennial forest cycle so as to avoid ecological imbalances as well as soil problems.

RAJASTHAN

Widespread heavy rains after three years of drought resulted in severe floods. Standing crops in four lakh hectares were destroyed out of the total affected area of eight lakh hectares. While 150 to 200 persons lost their lives, a population of seven lakhs in 8,914 villages of eleven districts of the State was affected by floods.

The State Government sought Rs 100 crores Central assistance for flood relief in the State and submitted a preliminary report to the Union Government on the damage caused to life and property by recent heavy rains and floods in the State. The three-member Central team which made an aerial survey of the flood-affected areas of the State recommended to the Union Government an immediate sanction of an "interim assistance" of Rs 10 crores for relief. The team also recommended allotment of 50,000 tonnes of cement and 4,00,000 galvanised sheets for providing temporary shelters to the flood victims.

The grain-producing areas of north-eastern Rajasthan comprising Bharatpur, Sawai Madhopur, Tonk and Jaipur districts had been turned into deep ravines by the recent floods.

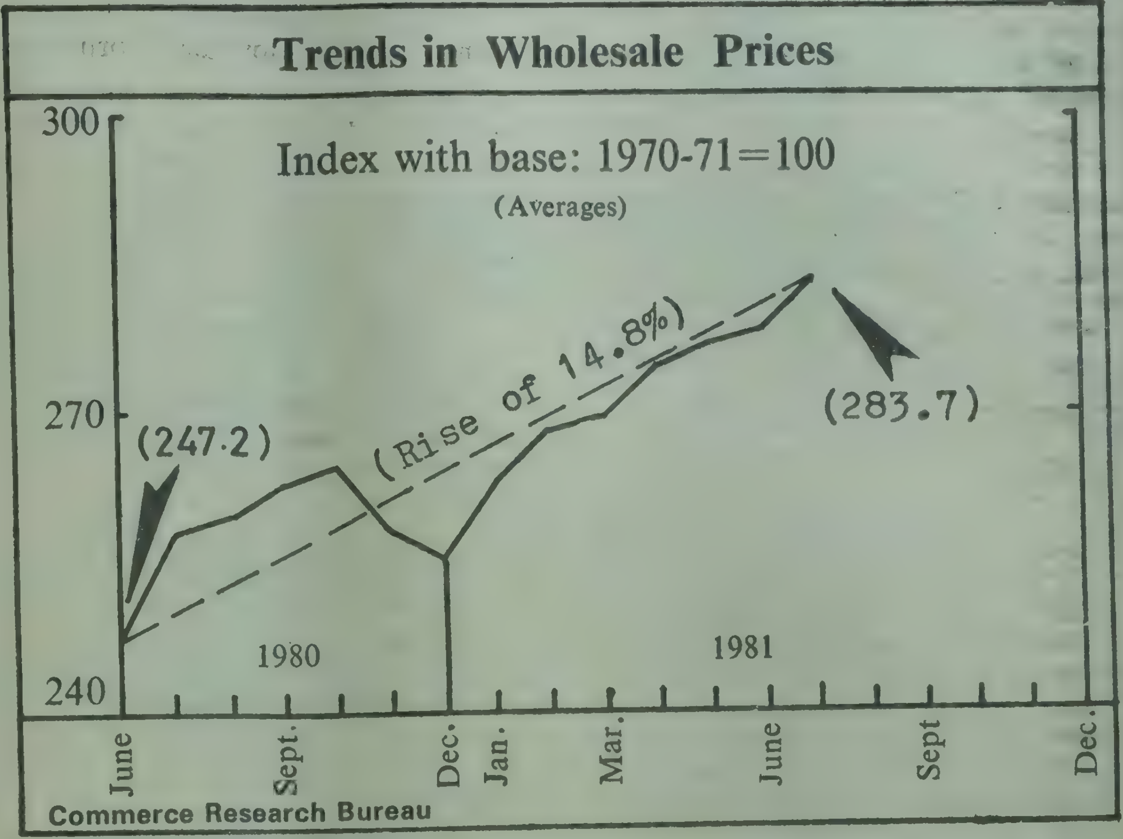
More emphasis was being laid on cash crops in the State during the current kharif season compared to foodgrains. According to a programme drawn up by the Agriculture Department, though the overall cropped area would be at the same level as in the year 1980, the area under foodcrops would be reduced by six lakh hectares to 83.40 lakh hectares.

TAMIL NADU

The lack of rains in the initial stages of the monsoon delayed the sowing of *Kuruvai* (kharif) paddy in the State by about a month. The sowing of groundnut, grown over an area of 8.8 lakh hectares, was also delayed. These factors made the outlook for kharif crops grim. Meanwhile, drought conditions persisted in some parts of the State. The State Government arranged to distribute seeds at subsidised rates to small and marginal farmers in the drought-hit areas.

The State Government spent Rs 22 crores out of Rs 33 crores allotted for drought relief work in the State up to July 4, 1981. Land development banks in the State were permitted to reschedule the overdues amounting to Rs 93 crores as on June 30, 1980, of farmers who had been affected by natural calamities during the period 1974-78.

The Tamil Nadu Civil Supplies Corporation reduced the issue price of open market sugar to Rs 675 per quintal from



PRICES IN JULY 1981

Rise in prices unabated

AT 283.7 the average wholesale price index for July 1981 was 1.9 per cent higher than in June 1981. During the first four months (April-July) of 1981-82 the wholesale price index was higher by 13.6 per cent over that in the corresponding period of 1980-81.

The steep rise in the wholesale price index during July 1981 was partly attributed to the increase in prices of petroleum and its products, fertilisers and cement and partly due to the rise in the prices of food articles such as rice, jowar, bajra, ragi, gram, arhar, condiments and spices, butter and ghee, and eggs.

Month	Wholesale price Index (Average) (1970-71=100)	Percentage change
1980		
June	247.2	+3.0

the existing price of Rs 725 per quintal with effect from July 1, 1981. The open market sugar is released by the Corporation to all bulk consumers and to the public for social and religious functions.

The tea plantation industry in the State was reported to be passing through a crisis as a result of an overall increase in costs accompanied by persistent fall in the prices. Unless remedial measures were undertaken immediately, nearly 60 per cent of the tea estates in the State would be in the 'red', throwing several thousand workers out of employment.

TRIPURA

The State Government decided to establish a corporation with an estimated capital investment of Rs 5 crores solely with the purpose of settling permanently the tribal *jhumias* (shifting cultivators) in rubber plantation. The *jhumia* settlement scheme would be labour-intensive and the proposed corporation was likely to spend Rs 10,000 for each *jhumia* family over a period of eight years. Each family would be allotted two hectares of land to grow and nurse rubber trees under the corporation's supervision.

The Indian Dairy Development Corporation approved a Rs 56-lakh project for integrated dairy development in the State. Under the project, a total of 80 milk co-operative units would be formed under a central dairy organisation to increase production and distribution of milk throughout the State by directly involving over 16,000 milk producers.

UTTAR PRADESH

Nearly half of the State was hit by floods as a result of heavy and continuous rain all over the State bringing misery to more than 70 lakh people, killing 187 persons, affecting about 8,875 villages in 31 districts and destroying a cropped area of four lakh hectares. A high-level committee was constituted under the chairmanship of the Chief Secretary to the State Government to supervise relief measures and keep constant vigil on the flood situation.

The State was expecting a record kharif harvest during 1981-82 as a result of bountiful monsoon and elaborate crop planning. The kharif foodgrains production target for 1981-82 was placed at 10 million tonnes as against an achievement of 9.1 million tonnes last year.

Under the social forestry scheme, afforestation in an area of 10,000 hectares would be completed in 42 districts in the State during the current rainy season.

WEST BENGAL

Heavy rains and floods in Midnapore district during the first fortnight of July resulted the death of four persons and damage to the *aman* crop. The overall crop position in the State was, however, normal and the State expected to harvest a normal kharif crop.

The State required 2.5 lakh tonnes of fertilisers including nitrogen and potash for rabi cultivation. The Centre had agreed to meet the demand fully. The distribution of fertilisers for the rabi season would begin from August 1, 1981 and would continue till January 31, 1982.

A task force on oilseeds was set up by the State Government to monitor the programme for larger cultivation of mustard and other varieties of edible oilseeds. The West Bengal Agro-Industries Corporation had taken up a rice bran oil project to meet the deficit in the supply of edible oil in the State. Initially a Rs 4.5-crore oil extraction unit would be set up.

The Jute Commissioner announced the statutory minimum prices of different grades and varieties of raw jute for purchase and sale in Calcutta during the season ending June 1982, for both ready and forward delivery under the Jute (Licensing and Control) Order, 1961. Accordingly the per quintal price of ex-Assam W-5 grade in Calcutta was raised to Rs 240 as against Rs 217.50 last year. The higher grades of raw jute for ready delivery at Calcutta were priced at W-1 — Rs 300, W-2 — Rs 285, W-3 — Rs 270 and W-4 — Rs 255 per quintal with a difference of Rs 15 per quintal in each grade. The difference for the lower grades at each level was, however, kept at Rs 10 per quintal. An interest at the rate of 19.5 per cent per annum would be added to the minimum prices whenever the payment for the prices of the goods was made beyond 11 days.

The World Bank agreed to give an assistance to the State Government for establishing 45 cold storage plants. The assistance would be routed through the Agricultural Refinance and Development Corporation.

Rice

Procurement of rice during the 1980-81 kharif marketing season (November 1980 — October 1981) totalled 56.4 lakh tonnes until July 30, 1981 as against 37.7 lakh tonnes during the corresponding period of last year. Punjab contributed 25.2 lakh tonnes, Haryana 6.7 lakh tonnes, Andhra Pradesh 6.5 lakh tonnes, Uttar Pradesh 5.8 lakh tonnes, Madhya Pradesh 3.7 lakh tonnes, Tamil Nadu 1.7 lakh tonnes, West Bengal 1.3 lakh tonnes and the other States 5.5 lakh tonnes.

The Agricultural Prices Commission (APC) recommended the revised procurement price for common variety of paddy of Rs 115 per quintal for the 1981-82 kharif marketing season in the wake of the increase in the prices of urea and other fertilisers. The APC had earlier recommended Rs 113 per quintal.

In the Tiguddem market the price of rice (fine) declined by 2.8 per cent over the month to Rs 297.30 — 304.05 per quintal.

Wheat

India contracted for the import of 1.5 million tonnes of wheat from the United States at a total cost of Rs 259 crores. The landed cost of wheat worked out to Rs 160-165 per quintal and including insurance and storage charges it worked out to Rs 172.4 per quintal. The procurement of wheat during the current rabi marketing season (April 1981- March 1982) amounted to 6.4 million tonnes as on July 26, 1981 as against the target of 9.5 million tonnes. The shortfall in procurement was attributed to lower actual production than estimated in Punjab and Haryana of the order of 1.7 million tonnes.

The price of wheat (farm) in the Bhatinda market increased by 6.4 per cent over the month to Rs 143-155 per quintal.

Jute

In line with the recommendation of the task force on jute textiles that an inbuilt incentive in the price structure be provided to encourage growers to produce high quality jute, the Jute Commissioner increased the price differential between superior grades of jute for the 1981-82 season by Rs 15 per quintal for upcountry markets of the jute growing States. The differential ranged from Rs 10 to Rs 13.50 for the previous season.

Jute mills located in and around Calcutta would have to pay Rs 240 per quintal for W-5 grade during the 1981-82 jute season as against Rs 217.50 per quintal last season.

It was further stipulated that the Calcutta delivery prices would be applicable to contracts which provided for payment immediately or within 11 days of the beginning of the contract. Payments made beyond this time schedule would atttract interest at the rate of 19.5 per cent per annum.

The Soviet Union agreed to amend their purchase contracts so as to make 100 per cent payment of invoice value against shipment of jute goods from the country. Previously 97 per cent of the invoice value was paid, the balance three per cent being retained for adjustment against claims.

The price of jute (W-5) in the Calcutta market showed a rise of 10.3 per cent over the month to Rs 240 per quintal.

Cotton

The Union Government decided to allow the export of 55,000 bales of long and extra long staple cotton through the

Cotton Corporation of India and State Cooperative Marketing Federations. The Maharashtra State Cooperative Marketing Federation was allocated 25,000 bales, Gujarat State Cotton Cooperative Marketing Federation 15,000 bales and the Cotton Corporation of India 15,000 bales.

The Centre agreed in principle to allow the Maharashtra Government to continue its cotton monopoly procurement scheme with certain modifications for a period of one year.

The Cotton Corporation of India (CCI) finalised a deal with Tamil Nadu Textile Corporation for the supply of 10,000 bales of short and medium staple cotton at a concessional rate.

It was decided to import one lakh bales of short and medium staple cotton from Pakistan. The shipments would commence in September.

In the Bombay market the price of cotton (Bengal-deshi fine) rose by 2.8 per cent over the month to Rs 1,069 per quintal.

Edible oils

The Centre raised the effective duty on vegetable oils and allied products imported on private trade account to 150 per cent *ad valorem* on July 25, 1981. Imports by the State Trading Corporation would, however, continue to attract a concessional duty of only five per cent *ad valorem*. The Union Government further included vegetable fats in the list of items whose import was canalised through the State Trading Corporation.

Earlier during the month the Centre had raised on July 18, the import duty on six edible oils having regard to their international and local prices. The import duty on palm oil, rapeseed oil, soyabean oil, sunflower oil and palmolein was raised from 12.5 per cent *ad valorem* to 42.5 per cent *ad valorem* while in the case of coconut oil the duty (basic and auxiliary) was raised from 60 per cent to 80 per cent *ad valorem*.

The State Trading Corporation contracted for the entire quantity of five lakh tonnes of edible oils which the Centre proposed to import during 1981-82.

The Union Civil Supplies Ministry increased the allocation of edible oils to the States by 10 per cent to 51,000 tonnes during August for distribution through fair price shops.

The Union Government allowed the export of peanut butter within a limited ceiling.

In the Bombay market the price of groundnut (Karad bold) rose by 8.1 per cent over the month to Rs 637 per quintal.

Sugar

Sugar production during June 1981, the ninth month of the current sugar season, was lower at 7,000 tonnes as against 8,000 tonnes during the same month last year. This brought the total sugar production during the first nine months of 1980-81 season (October 1980—September 1981) to 50.48 lakh tonnes as against 38.05 lakh tonnes during the corresponding period last year. The offtake of sugar from the factories during June 1981 was 4.4 lakh tonnes for internal consumption and nil for exports as against 4.41 lakh tonnes for internal consumption and nil for exports during the same month last year. The total despatches during the first nine months were 34.88 lakh tonnes for internal consumption and 0.60 lakh tonnes for exports as against 40.86 lakh tonnes and 2.30 lakh tonnes respectively for internal consumption and exports during the corresponding period last year. The total closing stock of sugar with the factories as on June 30, 1981 was about 20.95 lakh tonnes as against 15.74 lakh tonnes on the same date last year.

The Centre has asked the sugar industry in the private and co-operative sector to undertake a commitment to supply on a loan basis up to a maximum of 4.50 lakh tonnes of free sale sugar to make up for the shortfall in the distribution of levy sugar through fair price shops. Representatives of both the sectors — Indian Sugar Mills Association and the National Federation of Cooperative Sugar Factories — agreed to make available the required quantity.

The first shipload of imported sugar out of the total contracted imports of 2.14 lakh tonnes would arrive at Kandla port by August 10 while the next shipment was expected at Vishakhapatnam port five days later. Thereafter there would be a steady arrival. Thus the imported sugar was expected to be available in time for the coming festival season.

The Centre ordered the release of 4.41 lakh tonnes sugar for internal consumption during August — 2.71 lakh tonnes of levy sugar and 1.70 lakh tonnes of free sale sugar. Compared with the July release, the free sale quota was reduced by 10,000 tonnes.

The price of sugar in the Hapur market declined by 14.9 per cent over the month to Rs 580-620 per quintal.

Rubber

The Centre decided to suspend further import of rubber due to sharp decline in the price of rubber.

Domestic production of rubber during 1981-82 was targeted at 1.60 lakh tonnes as against 1.53 lakh tonnes last year while consumption was estimated at 1.85 lakh tonnes in 1981-82 as against 1.74 lakh tonnes in 1980-81.

The Rubber Research Institute of India, (research wing of the Rubber Board) decided to take up trial rubber plantations in the Konkan region of Maharashtra. An area of 50 hectares belonging to the dairy project at Dapchari in Thane district had been taken over for this purpose.

The Centre withdrew the 8 per cent countervailing duty imposed on the import of natural rubber following a stay order of the Madras High Court on a petition filed by the industry. The duty was imposed in December 1978.

Tea

The first meeting of the reconstituted Tea Board was held at Calcutta on July 1. Inaugurating the meeting, the Union Commerce Minister, Mr Pranab Kumar Mukherjee referred to the problems of sick tea gardens and the important role of the tea industry in narrowing the country's trade gap.

Four tea estates in the Malabar area had closed down rendering 4,000 workers jobless. Several other estates in Kerala were reported to be on the verge of closure as they were unable to recover even the cost of production.

A new warehouse complex for tea was inaugurated at Cochin for the Nilgiris Small Tea Growers Service Industrial Cooperative Society. The warehouse with a capacity to store 4.5 lakh kg of tea had been constructed at a cost of Rs 10 lakhs.

Sudan had reduced the quantum of tea imports from India as the Sudan Tea Company was able to secure an import licence for just 45 per cent of the contracted quantum of 21.95 million lbs.

The price of tea in the Bombay market ruled steady at Rs 2,300 per quintal over the month.

Coffee

The United Planters' Association of Southern India urged the Union Government to give the coffee industry a fillip through a substantial upward revision in the minimum release price as the abolition of the export duty had not helped in improving the market situation. According to the Association the Government policy of pegging domestic prices between Rs 450 and Rs 560 for 50 kg for the principal grades and the steep rise in costs would land the coffee industry in difficulty.

CORPORATE SECTOR

In the market

Mayur Syntex

Mayur Syntex Ltd (Registered Office: E-29, N.D.S.E. Part II, New Delhi 110 049) is now in the capital market with a public issue of 13.30 lakh equity shares of Rs 10 each totalling Rs 1.33 crores. The proceeds will partly finance a Rs 6.23-crore spinning mill project with an initial installed capacity of 15,840 spindles for the manufacture of cotton and synthetic blended yarn at Sikandrabad, District Bulandshahr in Uttar Pradesh. Trial runs are expected to commence in August-September 1981.

Other developments

An amount of Rs 56.40 lakhs (Rs 55.87 lakhs) is transferred to investment allowance reserve and Rs 45.78 lakhs (Rs 1.26 crores) to general reserve. Expenditure incurred on modernisation programme was Rs 3.30 crores.

Karnataka Bank Ltd: Improved performance

Karnataka Bank Ltd, with its registered and head office at Mangalore, achieved improved results for the year ended December, 1980. Total deposits of the bank at the close of 1980 increased to Rs 115.60 crores from Rs 104.24 crores at the close of 1979. The bank's paid-up capital and reserves at the end of 1980 stood at Rs 1.08 crores which constituted 0.93 per cent of its total deposits.

Total advances at the end of 1980 amounted to Rs 60.49 crores (Rs 55.59 crores in 1979). Priority sector advances of the bank formed 33 per cent of total advances as against the level of 40 per cent prescribed by the Reserve Bank of India to be attained by the year 1985. During 1980, the bank's gross income increased by 19.7 per cent to Rs 11.38 crores (Rs 9.51 crores in 1979). It earned a higher net profit of Rs 13.60 lakhs (Rs 12.99 lakhs). The dividend for 1980 was maintained at 12 per cent (same as in 1979).

The bank opened seven branches in 1980 of which four were in rural areas, one in semi-urban area and two in metropolitan centres. With the opening of a branch at Ahmedabad, the bank has extended its operation to the State of Gujarat. At the close of 1980, the bank had a total number of 244 branches, operations being spread over six States and three Union Territories.

The Karur Vysya Bank Ltd: Good results

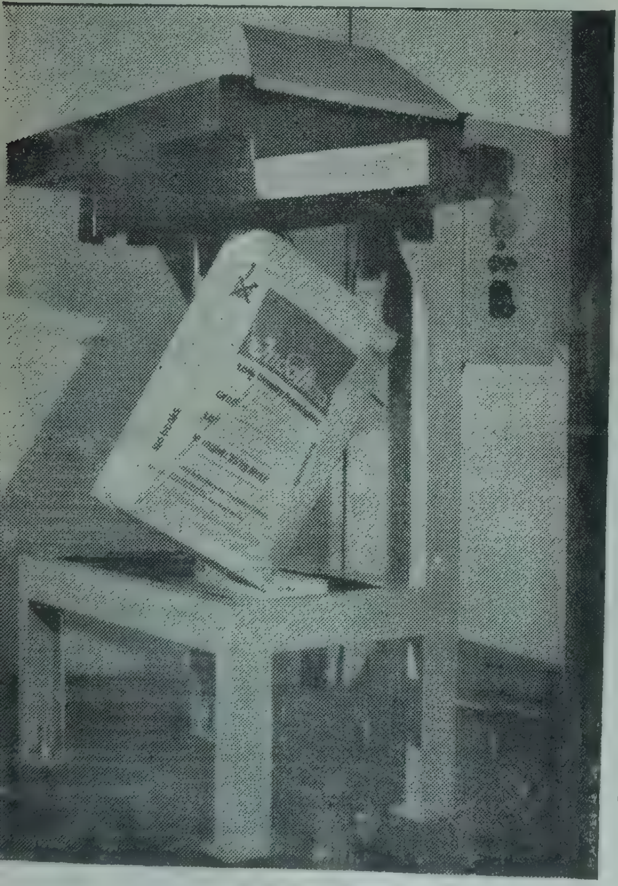
The performance of The Karur Vysya Bank Ltd (Registered office: Jawahar Bazar, Karur) for the year ended December 1980 was quite good. At the close of 1980, the aggregate deposits of the bank increased by Rs 13.33 crores or 23.3 per cent to Rs 70.55 crores (Rs 57.22 crores at the end of 1979). The total advances of the bank, including bills purchased and discounted, increased from Rs 35.65 crores in 1979 to Rs 41.90 crores in 1980 recording a growth rate of 17.53 per cent. The advances to priority sectors rose by about Rs 3 crores in 1980 forming about 31 per cent of the total advances made as against 30 per cent in 1979.

With the opening of 10 new banches, the bank's total number of branches at the close of 1980 has gone up to 126. Out of these 126 branches, 34 are located in rural areas, 49 in semi-urban, 29 in urban and 14 in metropolitan cities.

The bank's financial performance during 1980 was quite encouraging. The net profit for the year, after providing for taxation and other usual and necessary provisions, rose to Rs 14.10 lakhs from Rs 9.81 lakhs in the previous year. Including the balance brought in from the previous year and other adjustments, the total amount available for appropriation was Rs 14.19 lakhs. The directors appropriated Rs 6.40 lakhs to statutory reserve, Rs 3 lakhs to investment reserve, Rs 0.15 lakh to development reserve and Rs 0.14 lakh to charity fund. The equity dividend was stepped up from 14 per cent to 15 per cent and absorbed Rs 4.28 lakhs and the balance was carried forward. The bank's paid-up capital at the end of 1980 amounted to Rs 29.99 lakhs. Total reserves increased to Rs 70.62 lakhs from Rs 61.19 lakhs at the close of 1979.

Continuous hot air sealer from L&T

A continuous hot air sealer capable of sealing a variety of polythene bags, and with wide application in industries, like petrochemical, fertiliser, food, pharmaceutical needing to seal a wide range of bag thicknesses and sizes, has been developed by Larsen & Toubro Ltd. The continuous hot air sealer is a high production in-line machine for sealing premade, pre-filled polythene bags. The polythene bag duly filled is manually straightened at the unsealed edge and inserted into continuously moving grip belts. The bag moves into a hot air chamber and is plasticised. Further under the pressure of crimp rollers, it is fused and the pattern of the crimp roller is embossed on the bag. When it emerges, the bag is duly sealed and ready for retailing. The crimp roller can be equipped with interchangeable date codes or logo, which makes the bag proof against spurious packers. The machine is designed to take the smallest and largest bags. The smaller bags are self-supported, while the bigger bags travel on a belt which is synchronised with the speed of the sealer.



The continuous hot air sealer.

Fibreglass Pilkington to issue debentures

Fibreglass Pilkington Ltd has reported higher sales for the year ended March 1981 at Rs 11 crores compared to Rs 9.57 crores in the previous year. The net profit, after providing Rs 89.38 lakhs (Rs 78.22 lakhs) for taxation, was Rs 66.62 lakhs (Rs 54.78 lakhs). The equity dividend recommended for the year under review is 16 per cent (same). An amount of Rs 11.25 lakhs (Rs 5.80 lakhs) is transferred to investment allowance reserve. The company is shortly issuing debentures of Rs 2.63 crores.

Vickers Sperry maintains

Total income of Vickers Sperry of India Ltd for the year ended March 1981 increased to Rs 5.66 crores from Rs 5.14 crores in the pevious year. The net profit, after providing Rs 46.20 lakhs (Rs 30.84 lakhs) for interest payments and Rs 7 lakhs (Rs 32 lakhs) for taxation, amounted to Rs 45.69 lakhs (Rs 31.52 lakhs). The equity dividend recommended for the year under review is 15 per cent (same). During the year under review the company's new undertaking at Pimpri was completed in all respects. Orders on hand are Rs 5.50 crores.

Sayaji Mills earns profit

Sayaji Mills Ltd has earned a net profit of Rs 1.64 crores for the year ended March 1981 compared to a net loss of 13.25 lakhs incurred in the previous year, after providing Rs 76.91 lakhs (Rs 46.91 lakhs) for depreciation and Rs 55 lakhs (nil) for taxation. The equity dividend recommended for the year under review is 22 per cent (15 per cent). An amount of Rs 33.18 lakhs (nil) is transferred to investment allowance reserve and Rs 1 crore (nil) to general reserve.

PUBLIC SECTOR

United Commercial Bank: Record rise in deposits

The United Commercial Bank made its record increase in deposit accretions from Rs 1,493 crores in 1979 to Rs 1,905 crores in 1980. The bank's deposit growth rate was 28 per cent during 1980, which is substantially higher than the 16 per cent average growth of all the scheduled banks of the country.

The total advances of the bank rose from Rs 917 crores in 1979 to Rs 1,125 crores in 1980. The share of priority sector credit in total credit of the bank rose from 30 per cent to 33.34 per cent *i.e.* from Rs 235 crores to Rs 306 crores. Priority sector advances consisted of Rs 128 crores (previous year Rs 94 crores) for agriculture, Rs 135 crores (previous year Rs 105 crores) for small scale industries and the balance for retail trade, professionals, self-employed, education etc.

The bank made concerted effort to increase credit under Differential Rates of Interest Scheme and the amount advanced formed 0.87 per cent of the total advances in 1980.

The bank has added as many as 148 branches in 1980 and the total number of branches reached to 1,267. Besides, the bank has 9 overseas branches. Of the 148 branches opened in 1980, 124 were opened in the villages. The areawise break up of branches the end of 1980 was as follows, rural 616, semi-urban 259, urban 226 and metropolitan 166.

Under the Village Adoption Scheme, the bank adopted 4,539 villages which were spread out in almost all the states. 1,22,425 borrowal accounts under the scheme enjoyed a credit of Rs 30 crores representing a 27.9 per cent increase over that of the previous year. Although branching out in rural areas meant a slow-down in commensurate returns, the bank improved its net profits from Rs 2.22 crores in 1979 to Rs 2.28 crores in 1980.

New Bank of India : Deposits up

The operations of New Bank of India (nationalised on April 15, 1980) during the year ended December 1980 were quite satisfactory. Despite various constraints, the bank's deposits increased by Rs 61.22 crores from Rs 442.06 crores as at the end of 1979 to Rs 503.28 crores as at the close of 1980 and recorded a growth rate of 13.8 per cent. The average deposit per branch at the end of 1980 showed an increase of Rs 8.73 lakhs over the previous year's figure and stood at Rs 1.18 crores.

The bank's total credit advanced in 1980 rose to Rs 256.62 crores (Rs 252.87 crores in 1979). While the increase in advances was Rs 4.05 crores, the increase in priority sector advances was of the order of Rs 7.89 crores *i.e.*, from Rs 71.76 crores to Rs 79.65 crores. There was a growth of 10.99 per cent in priority sector advances over the previous year. During 1980 the bank added 8,671 priority sector accounts to its previous year's figure of 21,440. The priority sector advances as on December 26, 1980 constituted 31.07 per cent of total advances. Advances to agricultural sector increased from Rs 14.77 crores to Rs 19.52 crores and recorded a growth of 32.16 per cent.

The total number of villages adopted by the bank increased to 487, thereby increasing the beneficiaries also. The bank's participation in ARDC (Agricultural Refinance Development Corporation) refinance scheme also improved. The bank drew Rs 3.36 crores by way of refinance and repaid Rs 1.16 crores during 1980. The refinance obtained from ARDC as at the end of 1980 stood at Rs 6.89 crores. The bank laid more emphasis on increasing its outlay under the DRI (Differential Rate Interest) Scheme. More loans were advanced under the above scheme, raising the total outstanding to Rs 77.52 lakhs in 5,922 accounts.

In 1980, the turnover of foreign exchange business increased to Rs 163 crores (Rs 156 crores in 1979). The export finance outstanding as at the close of 1980 was Rs 16.96 crores. It financed construction contracts/turnkey projects undertaken by its clients in Iraq and Saudi Arabia. Guarantees in this respect outstanding at the close of 1980 was Rs 15 crores.

The bank opened 22 new branches in 1980, raising the total number of branches to 423. Out of the total number of branches, 165 were in rural areas, 104 in semi-urban centres, 87 in urban centres and 67 in metropolitan areas.

State Bank of Patiala : Deposits up by 30 per cent

The operations of State Bank of Patiala during the year ended December 1980 resulted in a growth of 30 per cent in its aggregate deposits to Rs 356.10 crores from Rs 273.92 crores, at the close of 1979. While Rs 197.89 crores of these deposits were mobilised from the rural areas, deposits from urban and metropolitan areas accounted for Rs 158.21 crores. The bank's total advances during 1980 increased to Rs 233.73 crores from Rs 207.47 crores at the end of 1979.

Advances to priority sectors, *viz* agriculture, small scale industry and small business finance, were also higher at Rs 111.04 crores (Rs 96.88 crores in 1979) and constituted 47.5 per cent of the total advances of the bank, as against the stipulated level of 40 per cent prescribed by the Government to be achieved by 1985. Agricultural advances rose by 24.35 per cent to Rs 65.25 crores (Rs 52.47 crores) and accounted for 27.91 per cent of the total advances. By the end of 1980, the bank had adopted 3,498 villages for assisting 47,846 farmers. The bank formulated 260 schemes under ARDC programme covering a wide range of agricultural and allied activities and disbursed loans aggregating Rs 42.43 crores under such schemes. Total loans granted to small and marginal farmers amounted to Rs 9.99 crores and formed 20.05 per cent of the direct advances in agricultural sector. During 1980, the advances to small scale industries totalled Rs 33.89 crores.

In 1980, the bank provided financial assistance to the tune of Rs 2.09 crores as DRI (differential rate of interest) advances assisting 18,058 persons. Sixty four per cent of these loans were to persons belonging to scheduled castes/scheduled tribes.

With the opening of 40 more branches, the bank's total number of branches at the close of 1980 stood at 365.

Air India among top 15

Air-India has been ranked among the top fifteen scheduled international airlines, in overall performance last year, according to the world airline statistics published by the International Air Transport Association. These figures place Air-India in the 13th position in 1980 in terms of international passenger, cargo and mail revenue tonne kilometers (RTKms) with a total RTKm performance for the year of 933 million. This represents a sharp increase of 159 million RTKms over Air-India's performance in 1979, or an increase of 120 per cent. The total number of revenue passengers carried by Air-India in the financial year 1980-81 was 1,417,817, or 27,265 passengers per week.

The only other Asian airline among the leaders was Japan Airlines which stood second with British Airways topping the list. The other international IATA carriers ahead of Air-India in 1980 were Air France, Lufthansa, KLM, Qantas, TWA, Alitalia Swissair, Air Canada, Iberia and SAS.

Hindustan Organic Chemicals: Higher sales

Hindustan Organic Chemicals Ltd has reported higher sales for the year ended March 1981 at Rs 34.41 crores compared to Rs 31.24 crores in the previous year. Exports during the year under review were Rs 1.39 crores. The operating profits were Rs 5.88 crores (Rs 5.37 crores). Dividend declared for the year is 8 per cent. An amount of Rs 3.10 crores is transferred to general reserve.

The 16,500 tonnes per annum concentrated nitric acid plant by HOKO process, hydrogen (600 tonnes per annum), nitrobenzene (11,000 tonnes per annum), and aniline (6,000 tonnes per annnum) have all been completed. The Rs 1.20 crores effluent detoxification plant forming part of the company's integrated pollution control programme has been completed. The incinerator unit will be installed shortly.

Among the other on-going schemes, nitrotoluene expansion from 3,090 tonnes to 6,180 tonnes per annum and the acetyl group of plants for manufacture of 3,330 tonnes per annum of acetic acid and acetic anhydride will be completed by December 1981 and nitrochlorobenzene expansion from 3,315 tonnes to 9,000 tonnes per annum will be completed by December 1982.

Bonus guidelines dampen scrips

Bombay, August 24

The revised bonus guidelines announced by the Government on August 18 scared the marketmen. Bulls, therefore, became active sellers during the past week. At the close of the week, modest-to-marked losses were widespread. Activity was fair and the undertone at the close was weak.

Starting on a promising note share prices advanced satisfactorily. The announcement of revised bonus guidelines raising the time limit from one bonus issue to another to 36 months from 24 months, residual reserves to 40 per cent from 33.33 per cent, NOC from financial institutions in case of failure in the payment of term loans, etc, led to heavy selling pressure. As no worthwhile support was coming even at the lower rates, shares generally closed at the week's worst levels.

BSE, however, lifted the daily margins imposed on 10 scrips on July 20. The announcement has been made only after the official closing of business on August 21. The removal is expected to have a salutary effect on equity sentiment next week. The scrips, which attracted the daily margins in case of excessive buying, were Century, Baroda Rayon, Gwalior Rayon, Reliance, Hindustan Aluminium, Tata Steel, Hindustan Motors, Premier Automobiles, TELCO and GE Shipping.

In the cleared list, Century faced heavy bull liquidation and the price slumped to Rs 805 from the week's best level of Rs 844. The closing was at Rs 808, recording a huge loss of Rs 29.50 from the previous week's closing rate of Rs 837.50. Standard dropped by Rs 26 to Rs 527. TELCO was marked down by 38 points to Rs 618.

The other losers were National Rayon, Walchandnagar Industries, Amar Dye-Chem, Gwalior Rayon, Hindustan Motors, Tata Oil, Tata Chemicals, Mukand, L & T, Voltas, G. E. Shipping, Scindia, Polychem, Bombay Dyeing, Khatau, Morarjee, Svadeshi Mills, Swan and Tata Mills. Surprisingly against the general declining trend, Tata Steel held the ground firmly at Rs 349.50.

Market Gossip

Bata take-over?

A PERSISTENT rumour in the local business circles these days is that Bata India, once a blue chip on the Calcutta Stock Exchange and one of the prominent and prosperous companies based in the eastern region, has been facing bad days. Worried by chronic labour trouble and rising costs all round, the foreign shareholders who still retain the controlling interest of 40 per cent are contemplating to sell away their holdings to some Indian business house. All kinds of names, big and small, are being mentioned including even Tatas. No ready confirmation is available but a change of management cannot be ruled out if the unsatisfactory conditions persist for long.

The first sign of a crisis in the company's long business career came when it had to drop some 150 highly paid managerial personnel. That slimming apparently has not helped the company much. In his address from the chair, Mr P. K. Nanda at the last annual general meeting gave some idea of the crisis that has overtaken the company for some time. Referring to the results of 1980, he said that, although sales growth in value terms was still 14 per cent, retail sales in quantity were static and there was a decline of six per cent in wholesale trade. The company faces environmental difficulties, of course, but the real key to growth and profitability lay in improved production at the factories particularly the main one at Batanagar.

Far from there being any improvement a series of agitations and work stoppages "caused by unwarranted and irresponsible union action" led to a sharp drop in production in many lines. One of the high priority export orders could not be met and costs particularly wages continued to grow. Consequently Batanagar maintained its uninterrupted record of a heavy drain on profitability. Operating losses is that factory over the last four years have crossed the Rs 10 crores mark. Meanwhile costs continue to escalate making the situation steadily more difficult. The immediate prospects were quite uncertain, according to Mr Nanda.

Bata India chairman's observations on the prospects for the company were made only last April. Since then nothing much has happened to alter the outlook. According to observers a bad position is moving towards worse and so takeover rumours keep circulating. Some one has also suggested that in keeping with the trend in this part of the country Bata India may even become a government company some day!

For those who may be interested in the financial results of the company here are the figures : sales in 1980 totalled Rs 111.73 crores representing in value terms a rise of 14.5 per cent but the profit at Rs 11.8 million showed a heavy fall. With taxation taking away Rs 8.4 million the after-tax profit was only Rs 3.4 million against the previous year's Rs 6.1 million. A 10 per cent dividend has been paid practically absorbing the entire net profit.

Buoyant groundnut oil

BOTH the trade and the government would seem to be attempting to create illusions in the mind of the public that they are trying to find a way out of the runaway groundnut oil prices. The Bombay trade has accepted a voluntary ceiling of Rs 165.36 per 10 kg, which was actually even higher than the season's peak of Rs 164.84. Certainly the trade was not helping the consumer but wanted to make sure of its extra profits. The Government of Maharashtra, on the other hand, promised to supply one kg of groundnut oil per ration card in Bombay and that too at Rs 16 per kg. Apart from the fact that this was evidence enough of the Government's incapacity to arrange proper and adequate supplies, depending on the number of members in a family, the price was not much different from the market price.

For the consumer edible oils have already become a luxury and the authorities are not even able to guarantee proper distribution of cheaper imported oils through fair price shops. It is an open secret that these imported oils find their way into the open market. The states are already reported to have received five lakh tonnes of these imported oils for distribution through fair price shops at a price of Rs 8,500 per tonne but the ordinary consumer has not benefited.

Sluggish aluminium?

HAS the world market in aluminium turned sluggish? International giants such as Alcoa and Alcan feel it that way and production of bauxite in Jamaica is being planned to meet this slackness in demand. Jamaica's bauxite production for the first six months of the current year was 6.1 million tonnes. This showed an increase of 6.3 per cent over production in the first half of last year. Alumina exports were also up by 11.4 per cent reaching 1.3 million tonnes. The Jamaica Bauxite Institute has reported that these increases were achieved despite the fall in the production of bauxite as a result of output cuts by Alcoa and Alcan. The Institute expected the production during the rest of the year to be reduced further with the result that 1981 bauxite mine output would be below last year's level.

Cheerful zinc

THERE has been a sharp increase during the current year in the European producers price for zinc from $925 to $1,000 a tonne. Cominco had increased earlier the prices by $50 to $875 in April and to $925 in May. Cominco's example is sure to be copied by other producers. A world-wide shortage of concentrates resulting from mine output cutbacks and strikes has been reported and there has been a spurt in London Metal Exchange values of zinc as also in the price paid by the US producers for their concentrates. But the recent increase of $75 in the producers price had no impact on the London Metal Exchange, which is relevant in considering the prices charged by the MMTC.

Cotton prices harden

Bombay, August 24

Cotton prices hardened during the past week by Rs 50 to Rs 150 per candy ignoring the prospects of early import of Pakistan cotton. Apart from the delay in announcing the terms and conditions, time was also lost in seeking clarifications about various vague details. Will all the exporters of textiles be eligible for getting the Pakistan cotton? Or only those who have deals with quota countries? A thousand and one questions had to get the answers before anyone could register their names with the CCI.

Although a little under half the quantity now contracted for had been reportedly booked, cotton circles are of the view that whatever little interest there is now in Karachi cotton would peter out once equivalent Punjab cotton from the new crop starts coming into the market. Meanwhile there are reports of the possible import of one more lakh bales of Pakistan cotton before the first lot has been cleared.

Meanwhile, significantly enough the Indian Commerce Minister told Parliament that while India was keen on expanding trade between the two countries on account of locational advantage, Pakistan was not agreeable to this.

The following has been the trend of prices of some of the leading varieties:

(Rs. per candy)

	August 21	August 14
Digvijay	5,000-5,100	5,000-5,100
Kalyan	4,700-4,850	4,700-4,800
Saurashtra CO2	4,900-5,100	4,800-5,050
Shankar 4	5,800-6,200	5,800-6,200
Maharashtra H 4	5,450-5,600	5,400-5,550
Maharashtra Varalaxmi	5,325-5,425	5,325-5,425
MP H4	5,300-5,450	5,250-5,400
MP Y1	4,950-5,050	4,800-5,000
MP 1007	5,200-5,250	5,100-5,250
MP A 51/9	5,100-5,200	5,100-5,200
MCU 5 Guntur	5,900-6,100	5,900-6,100

Yarn: Downtrend continues

Bombay, August 24

A downward trend was noticed in the local yarn market during the past week. The prices of 150D NRC, 120D NRC, 150D CR and 120D CR decreased by Rs 0.40, Rs 0.40, Rs 0.68 and Rs 0.84 to Rs 51.63, Rs 53.83, Rs 51.08 and Rs 53.68 respectively, while the price of 100D SIV increased by Rs 6.05 to Rs 61.12. The price of 150D acetate, however, remained unchanged at Rs 49.01.

Jute goods: Plan for buffer stock

Calcutta, August 17

There was a flutter in jute circles in Calcutta in the wake of the report that the Centre is seriously considering a rescue programme to bail out the jute industry from the prevailing crisis. In order to build a buffer of jute goods for stabilising the jute economy, the Director-General of Supplies and Disposals (DGS & D) might be asked to buy 100,000 bales of B-twills in addition to its usual monthly purchases. The DGS & D has been buying 35,000 bales a month on an average since the beginning of this year.

The purchase will help reduce the large inventory of mills totalling 122,300 tonnes, including 48,500 tonnes of sacking at the end of june. The reduction in the inventory will go a long way towards giving financial relief to the industry. In the process, prices of jute goods are expected to pick up. At prevailing values, mills are stated to lose considerably on their simultaneous business. The industry claims that its total loss works out to nearly Rs 12 crores each month after taking into account the recent increase in labour costs and in the price of the fibre.

If the industry is to regain its poise, steps must be taken not only to regain the lost overseas markets but also to activate domestic sales, according to informed sources. The industry has represented that the scheme of subsidy on export should be revived in order to fight competition by Bangladesh and synthetic substitutes. If the industry is helped in rehabilitating itself it will be able to raise the export of goods to the target of 550,000 tonnes a year by the end of 1984-85. The industry also feels that an export fund as recommended by the Task Force will be constituted to promote overseas sales. Contributions to the fund will be shared equally by the Government and the industry through the collection of a cess on output.

The industry is reported to have represented to the Centre to prohibit the use of old gunny bags in the cement industry. It has also taken active measures to diversify the range of products so as to cater to the requirements of overseas and domestic buyers. Reports circulate that the Centre will soon constitute a Jute Board as recommended by the Task Force for co-ordinating the functions of various bodies now operating The said board will absorb the office of the Jute Commissioner and the Jute Manufacturers Development Council.

Even as the industry is struggling hard to dispose of huge stocks held by it due to recession in overseas demand, ominous signs emerged on the horizon by way of a one-day strike staged by its workers to press for early implementation of the wage pay-scale recommendations made by the Bhattacharyya Committee with a threat from the trade unions controlling the workers of an indefinite strike

NOTICE

Universal Steel & Alloys Limited

It is hereby notified for the information of the public that Universal Steel & Alloys Ltd., proposes to give to the Central Government in the Department of Company Affairs, New Delhi a notice under sub-section (I) of Section 21, of the Monopolies and Restrictive Trade Practices Act, 1969, for substantial expansion of its activities. Brief particulars of the proposal are as under:

(i) Name of person/body corporate owing the undertaking:
Universal Steel & Alloys Ltd.

(ii) Capital structure of the applicant company:
Authorised capital of the company is Rs. 2.00 crores consisting of 15 lacs equity shares of Rs. 10/- each and 50,000 preference shares of Rs. 100/- each. Issued and subscribed capital is Rs. 57.50 lacs consisting of 5,75,000 equity shares of Rs 10/- each fully paid up.

(iii) Details of the proposed substantial expansion:

(a) Name of new goods to be produced, supplied, controlled or distributed or of new services to be rendered:
Not applicable.

(b) In the case of substantial expansion of existing Activities:

(i) Name of goods: Steel Ingots/Billets
(ii) Capacity before expansions: 28,000 M. Tonnes
(iii) Expansion proposed: The proposal is to produce Steel Billets with improved methods by installing continuous casting machines within the existing capacity.

(iv) Location of the project for substantial expansion: At the existing plant i.e. 12/6, Milestone, Mathura Road, P.O. Amar Nagar, Faridabad (Haryana).

(v) Brief outline of the cost of the project the scheme and sources of finance:

Cost of Project (Rs. in lacs)		Scheme and Sources of finance (Rs. in lacs)	
Buildings	1.50	Loans	50.00
Machinery	70.00	Internal generations ..	21.50
	71.50		71.50

Any person interested in the matter may make a representation to the Secretary, Department of Company Affairs, Government of India, Shastri Bhawan, New Delhi within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

S. K. TULI
Company Secretary

JUGGILAL KAMLAPAT JUTE MILLS CO. LIMITED
KAMLA TOWER, KANPUR.

NOTICE

It is hereby notified for information of the Public that Juggilal Kamlapat Jute Mills Co. Limited proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval for the establishment of a new undertaking for production of 36,000 M.T. per annum capacity Asbestos Cement, corrugated, semi-corrugated, flat sheets, asbestos pipes and accessories etc. Other particulars of the proposed new undertaking are as under:—

(1)	Name of the proposed Undertaking.	:	Juggilal Kamlapat Jute Mills Co. Limited (Asbestos Cement Products Division)
(2)	Name of the person(s) or authority/authorities proposing to establish the new undertaking. Whether it is a body corporate, furnish details of its management structure together with those of proposed undertaking.	:	Juggilal Kamlapat Jute Mills Co. Limited, Public Limited Company managed by Board of Directors.
(3)	Capital structure of the applicant person or authority and of the proposed undertaking.	:	The capital structure of the applicant company as on 31-7-1981 is as under.

AUTHORISED CAPITAL:

			(Rs. in lakhs)
25,000	4½%	Income Tax Free cumulative preference shares of Rs. 100/- each	25.00
25,000	6%	Income Tax Free cumulative preference shares of Rs. 100/- each	25.00
7,50,000		Equity Shares of Rs. 10/- each	75.00
			125.00

PAID UP CAPITAL:

5,000	4½%	Income Tax Free cumulative preference shares of Rs. 100/- each	5.00
5,000	6%	Income Tax Free cumulative preference shares of Rs. 100/- each	5.00
4,87,500		Equity shares of Rs. 10/- each	48.75
			58.75

The proposed undertaking will be a division of the applicant company and, therefore, will not have separate capital structure.

(4) Proposed location of the new undertaking : In any backward district of M.P.

(5) Brief outline of the cost of project, the scheme and sources of finance : PROJECT COST:

(i)	Land	Rs. 5 Lacs
(ii)	Building	Rs. 110 Lacs
(iii)	Machinery Indigenous ..	Rs. 210 Lacs
	Imported	Nil
(iv)	Working capital	Rs. 50 Lacs
(v)	Pre-operating expenses ..	Rs. 25 Lacs
		Rs. 400 Lacs

SOURCE OF FINANCE:

(i)	Rs. 133 lacs	from internal sources
(ii)	Rs. 267 lacs	borrowings from banks and financial institutions
	Rs. 400 lacs	

Any person interested in the matter may make a representation to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this Notice, intimating his views on the proposal and indicating the nature of his interest therein.

Edible oil prices react

Bombay, August 24

After the recent sustained rise, edible oil prices reacted in the oilseeds market during the past week. Groundnut oil declined by Rs 5.72 to Rs 158.60 per 10 kg on fears of government measures to contain the high price. Imported oils dropped on slack demand and weakness in groundnut oil. Palmoleine slipped back by Rs 2.08 to Rs 147.68, soyabean by Rs 3.60 to Rs 142.52 and RBD by Rs 5.20 to Rs 130 per 10 kg.

As a result of weakness in ground nut oil and discouraging advices from producing centres, groundnut also lost modest ground. Karad bold, Saurashtra bold and Saurashtra quality yielded Rs 6 each at Rs 640, Rs 645 and Rs 650 per 100 kg.

Activity was poor in castorseed and its oils. Buyers were cautious following lack of export inquiries. Madras small and Kanpur bold eased by a rupee each to Rs 328 and Rs 320 per 100 kg respectively. Castor commercial oil and BSS oil became cheaper by 75 paise each at Rs 70.75 and Rs 75.75 per 10 kg respectively.

Although linseed bold was steady at Rs 542 per 100 kg, its oil reacted by Rs 2.08 to Rs 133.12 per 10 kg in view of the weak trend in other oil prices.

As regards cakes, groundnut expeller, de-oil and cottonseed suffered by Rs 125, Rs 25 and Rs 100 per tonne respectively. Castor, however, remained steady at Rs 780.

Comparative prices in rupees per quintal of seeds and per 10 kg of oils:—

	22-8-81	14-8-81
G. nut Karad bold	640.00	646.00
G. nut oil	158.60	164.32
Cast, Md. Sm	328.00	329.00
Cast. oil BSS	75.75	76.50
Cast. oil com.	70.75	71.50
Linseed bold	542.00	542.00
Linseed oil	133.12	135.20

Foodgrains weak

Bombay, August 24

A subdued tendency was noticed in foodgrains during the last week. Both wheat and rice receded on poor demand. Sellers were active in rice because of ample arrivals from the South. Coarse grains were steady barring maize which spurted on paucity of supplies. Masoor dal eased on increased supplies, while the other pulses ruled steady.

Wheat receded because of slack demand. Stockists were eager to unload. Arrivals were more than 800 bags per day. Advices from producing centres were discouraging. The inflow was good at the producing centres, while the buyers were few. The Saurashtra and superior varieties of wheat slipped by Rs 3 to Rs 220-230 per quintal and Rs 280-320 per quintal respectively. The undertone was quiet.

Rice drifted on good inflow from south by rail. Sellers were active. Stockists were keen on unloading old stocks. Surti kolam declined by Rs 10 to Rs 340-400 per quintal on poor local demand. Basmati ruled steady at Rs 450-600 per quintal. Export demand was limited.

Sugar nosedives

Bombay, August 24

Sugar prices nosedived in the local market during the last week following the liberal release of 2.25 lakh tonnes of free sale sugar (inclusive of 25,000 tonnes of imported sugar) for domestic consumption by the Centre for the month of September as compared to 1.70 lakh tonnes this month. The price of C-30 grade sugar crashed by Rs 103 to Rs 535-550 per quintal. As on August 22, 1981 the price of sugar C-30 was lower by Rs 194 per quintal than on the corresponding date a year ago.

The State sugar factories slashed their prices by Rs 88 to Rs 515 per quintal at the end of the week.

Bullion up

Bombay, August 24

Gold and silver showed an uptrend, barring a mid-week setback in the Bombay bullion market during the past week

Standard mint gold opened at Rs 1,730 per 10 gms and, after reaching the week's high of Rs 1,775 per 10 gms on August 19, receded to close at Rs 1,745 per 10 gms. Ready silver (.999 fineness) opened at Rs 2,705 per kg and went up to reach the high of Rs 2,790 per kg on August 19. Thereafter, it showed an erratic trend and was finally placed at Rs 2,765 per kg.

Money comfortable

Bombay, August 24

Conditions in the Bombay short term money market were comfortable during the past week. Interest rates opened at 9.5 per cent and moved in the range of 8 per cent and 9 per cent till August 20 (Thursday). The rates dipped to as low as 2.5 per cent the next day only to firm up once again to close at 9 per cent.

Bank credit contracts

Bombay, August 24

Bank credit of scheduled commercial banks contracted by Rs 68.36 crores to Rs 26,775.05 crores during the week ended August 14, 1981. Aggregate deposits increased sharply by Rs 152.04 crores to Rs 40,708.38 crores. The balances of banks with the Reserve Bank of India (RBI) spurted by Rs 555.65 crores to Rs 5,741.97 crores and their borrowings from the RBI went up by Rs 3.72 crores to Rs 560.59 crores.

Notice

INDIA STEAMSHIP COMPANY LIMITED

NOTICE

NOTICE is hereby given that the 53rd Annual General Meeting of the Members of the India Steamship Company Limited, will be held at GRAND HOTEL, 15, Jawaharlal Nehru Road, Calcutta-700 013, on Monday the 21st September, 1981 at 3.30 P.M. to transact the following business:

1. To receive the Directors' Report and Audited Balance Sheet and Profit and Loss Account for the year ended 31st March, 1981.
2. To sanction payment of Dividend on Preference Shares as recommended by the Directors for the years ended 31st March, 1979, 31st March, 1980 and 31st March, 1981.
3. To sanction payment of Dividend on Ordinary Shares as recommended by the Directors for the year ended 31st March, 1981.
4. To elect a Director in place of Mr K. K. Birla who retires by rotation and is eligible for re-election.
5. To elect a Director in place of Mr Dewan Dina Nath who retires by rotation and is eligible for re-election.
6. To elect a Director in place of Mr Sunil Kumar Singh Roy who retires by rotation and is eligible for re-election.
7. To appoint Auditors of the Company and for the Branch Office, Bombay, for the current year and to fix their respective remuneration. In this connection, to consider and, if thought fit, to pass, with or without modification, the following Resolutions as Special Resolutions:

RESOLVED that Messrs. G. Basu & Co. and Messrs. Singhi & Co., Chartered Accountants be re-appointed as Auditors of the Company until the conclusion of the next Annual General Meeting on a remuneration to be fixed by the Board of Directors, to be paid in equal shares to them.

RESOLVED that Messrs. Ford, Rhodes, Parks & Co., Chartered Accountants, be re-appointed as Auditors of the Bombay Branch Office of the Company until the conclusion of the next Annual General Meeting on a remuneration of Rs 5,000/-.

The Register of Members and Share Transfer Register of the Company will be closed from Tuesday, the 1st September to Monday, the 21st September, 1980 both days inclusive as notified.

By Order of the Board
A. MUKERJI
Senior Secretary.

India Steamship House,
21 Old Court House Street,
Calcutta 700 001.
The 14th August, 1981.

The dividend, if sanctioned will be payable on and after the 30th September, 1981 to those Shareholders whose names stand on the Register of the Company on 21st September, 1981.

NOTE: Member entitled to attend and vote is entitled to appoint a proxy and the proxy so appointed need not be a Member of the Company.

LE-As/181/81

Wanted a rational wage policy

Concluded from page 408

a rigid ideological egalitarianism in all matters if it conflicts with other social objectives. For instance, there may be good reasons for insisting that the wages or salaries of a highly qualified physician or a scientist be greater than those of a nurse or a mechanic. If as a result of the differential wages, the income spread between the occupations became exceedingly high, one could then use the tax laws to reduce the difference.

It is hoped that while formulating a rational wage policy, the authorities and the parties concerned would take into careful consideration the effects of some proposed or existing policy not only on some special interests in the short run but also on the general interest in the long run.

Obviously, no society can distribute more wealth than is created. No society, capitalist or socialist, can in the long run pay labour as a whole more than it produces. The best way to raise wages, therefore, is to raise labour productivity. All countries, including the Soviet Union, Yugoslavia, Cuba and China, now concentrate on stimulating and raising productivity. This can be done by many methods: by an increase in capital accumulation or modernisation of machines with which the workers are aided; by new, relevant inventions and improvements; by more efficient management on the part of employers, public or private; by greater industriousness and efficiency on the part of workers; by better education, training and more labour welfare measures; by labour participation in management and in the share capital of state enterprises.

A comprehensive wage or labour policy must pay due attention to all the factors or proposals outlined above. To see the problem as a whole, and not in fragments; that is the goal of real, enduring reforms. Real wages come out of production, not out of any decree or demand. Real wages—that is, wages in terms of goods they will buy—could really improve the living standard of workers.

Beyond headlines

Wanted a rational wage policy

By S. K. RAY

THE Government of India recently decided to set up a statutory wage board for its industrial undertakings. However, the basic question is the formulation of a rational wage policy, national in scope. The Union Government, state governments and private business managements are still making their wage policy decisions from crisis to crisis. If there is a call for a *bundh* or a threatened or actual strike in any industry, the wage policy is made in reaction to it. This is what happened recently in the jute industry, the engineering industry and some other instances.

Labour leaders' arguments for wage increases rest on concealed vote-catching considerations, and not on a careful analysis of the consequences of frequent and indiscriminate wage increases. The necessity of giving reasonable wages to create conditions for greater efficiency cannot be denied. But wage increases have occurred mostly in units where irresponsible trade unions are strong. As a consequence the costs of some of the larger units have been artificially increasing the economic strain. This, in turn, has actually accentuated industrial trouble without raising the efficiency of the workers.

Are decisions about wages merely the outcome of contents of power? Basic to everything else is a clear recognition of the fact that wages are related to productivity. Wages are the share of wage workers in the growing product, and can rise as production increases.

Wages are really paid out of the goods and services currently produced, not out of a "fund" or out of profits. The amount produced, compared with the number of people who must share in it, fixes an upper limit to wages.

But random and continuous wage increases without any consideration whatsoever for labour productivity have raised industrial costs and prices by leaps and bounds. Nearly 60 per cent of the industries have to divert 20 per cent or more of their total spending to meet the wage bill of their labour force. Taking 1961 as base, the remuneration per worker on an average has increased by 60 per cent.

In comparison with other countries, our labour productivity is quite low. Nevertheless, we have been paying labour much in excess of the rise in per capita national income. The average increase in per capita national income over the recent period has been 1.5 per cent, while the average increase in wages has been 4.6 per cent. Consequently, more purchasing power was injected than the quantum of goods and services available in the market. This has enhanced the vicious circle of rising prices and increasing costs of industrial production. The other effects of wage increases also have not been good for our economy. The transfer of purchasing power from upper income groups to labour has resulted in an overall reduction in the community's marginal propensity to save. As income is flowing more and more to wage-earners, the aggregate propensity to consume is rising, and this has further accentuated the inflationary pressure.

On the other hand, the availability of savings for the purpose of investment is dwindling. In industries where prices are controlled any rise in wages is likely to curtail their developmental potential. Where prices are not controlled, a rise in the prices of commodities as a consequence of higher labour costs primarily affects consumers. The real income of workers also can be increased by reduced prices of the things bought.

A rational wage policy must, therefore, be worked out. So far wage increases unrelated to the productivity or the actual contribution of the worker have been allowed indiscriminately. This will not help the economy, but only hurt it. Workers are not solely responsible for gains in production. Production gains arise from the accumulation of skills and technical knowledge, the use of mechanical equipment to supplement human energy, the investment of capital, managerial ability, and effort on the part of all groups of persons concerned. Economic development can be hastened only if the capital investment per worker is raised. In other words, part at least of the gains o productivity must be invested in the undertaking concerned. This may mean some conflict of interest between labour and capital in the short run, but the ploughing back of the gains of productivity will enable labour to enjoy a higher standard of living when the country passes the "take-off" stage. On the other hand, if workers insist on securing the lion's share of increased productivity, their ultimate gains will be diminished, because the shrinkage o the ploughing back of resources will lead to a lower rate of economic growth.

A rational wage policy must be based on the premise that it is not in the workers' interest to raise wages in the earlier stages of development as long as they enjoy a basic minimum wage. Only where the wage paid is below the minimum wage level would there be a case for increasing wages. An increase in productivity may be utilised to raise the wage level as long as it does not exceed the "fair wage" level, and also not impinge on the capital reqirements of industry, not injure the interests of other factors in industry and other groups in the community.

However, it is necessary to asser that each person—both in the organised and the unorganised sectors—is entitled to a basic set of services and income which provides him with adequate food, medical care and other basic necessities of life. These are matters of security and dignity which mus necessarily be the prior concern of a civilised society. In these times of inflationary pressures when money canno be relied upon to keep its value, it is vital that workers receive a substantia part of their income in the form of "rea wage" instead of "money wage." That is, they should be supplied with food shelter etc at prices that are within the range of the model income.

Also the Third World including India is essentially agricultural. There is a great need for a comprehensive legislation for agricultural labour. Among other things, it should specifically provide for hours of work, rates of wages, especially an increase in rea terms and welfare measures for agricultural workers, safeguards against exploitation by middlemen and money-lenders and similar measures.

Steps should also be taken to reduce invidious distinctions in works and wages. But one need not impose

PEOPLE

Bagai

Mr M. K. Bagai, 49, has been appointed a whole-time marketing director of Hindustan Petroleum Corporation, a Government of India undertaking. He has been with the corporation for 26 years and is an electrical and mechanical engineer by profession. Mr Bagai is a fellow member of the Institution of Engineers (India) and was selected in 1980 for a course conducted by the Royal Institute of Public Administration, London.

Neelakandan

K. S. Neelakandan, manager, public relations, Pfizer Ltd, has been elected president of the Public Relations Society of India Ltd which has 800 members through its eight chapters spread all over the country. Mr Neelakandan is also the executive chairman of the Ninth Public Relations World Congress to be held in Bombay in January next under the auspices of the International Public Relations Association. The theme of the congress : The Interdependent World—Role of PR.

Krishnamurthi

Mr T. Krishnamurthi, who has taken over as general manager (planning) of the Ahmedabad circle of the State Bank of India, was till recently general manager and managing director of Kuwait India International Exchange Co, the first joint venture of the SBI in West Asia. Mr Krishnamurthi joined Imperial Bank of India in 1946 and held several responsible positions with it and also when it subsequently became State Bank of India. He is a keen sportsman too.

Dandekar

Mr Tulsidas J. Tanna has been re-elected chairman of the Oils and Seeds Importers Association of India for the year 1981-82.

Mr Y. L. Rajwade, IAS, has taken over as managing director of the Maharashtra State Financial Corporation.

Mr A. V. Dandekar has been elected president of the Baroda Productivity Council for the year 1981-82. Mr Dandekar is general manager (manufacturing operations), Jyoti Ltd.

Aggarwal

Mr Roshanlal Aggarwal comes in for the second time as the president of the Bombay Metal Exchange Ltd, the premier local body of non-ferrous metals industry and trade which is now in its silver jubilee year. Mr Aggarwal is also president of All India Ball Bearing Merchants Association and was a past president of Maharashtra Small Scale Stainless Industries Association. He has been associated with several other metal bodies and educational institutions.

THE WEEK

The Revenue Minister of Maharashtra, Mrs Shalinitai Patil, was dismissed from the cabinet by the Chief Minister, Mr A. R. Antulay, on Monday. Her dismissal came in the wake of her open criticism against the Chief Minister for forcing cooperative sugar factories to contribute to various trusts founded by him. ★

The Union Government has constituted an inter-ministerial working group under the chairmanship of the Heavy Industry Ministry's secretary, Mr D. V. Kapur, to go into various aspects of utilisation and conservation of energy. ★

For the first time Indian Standards Institution has formulated guidelines on the disposal of solid wastes by civic bodies. ★

Over Rs 2,000 crores of public funds are believed to have been locked up in sick industrial units, according to Mr D. N. Davar, general manager of the Industrial Finance Corporation. ★

The Joint Plant Committee is reported to have liberalised the distribution guidelines for all steel items except plates and structurals. The move has come in the wake of improved production at the steel plants. ★

The Union Government will pay Rs 21.56 crores free of taxes as compensation to the Burmah Oil Co for the acquisition of shares of Oil India Ltd, Assam Oil Co Ltd and Burmah Oil Co (India Trading) Ltd A bill for the take-over of the remaining 50 per cent of the shares of the three companies was introduced in the Lok Sabha on August 29. ★

The Union Government has fixed the tariff value of free sale sugar at Rs 550 per quintal with effect from September 1, (Also see page 447). ★

The Gujarat Industrial Investment Corporation has signed an agreement with Geap group of industries in the United Arab Emirates to set up a five-star hotel at Baroda. ★

Wholesale price index

At 287.7, the latest available wholesale price index for the week ended August 15, 1981 showed a rise of 0.2 per cent over the preceding week and 10.4 per cent over the year.

Money comfortable

Conditions were comfortable in the Bombay short-term money market as of Monday (August 31, 1981). In the inter-bank call section both notified and commercial funds were renewed at 9.5 per cent while fresh money was transacted at 9 per cent. The market closed

COMMERCE

Controls and corruption

NOTHING in recent memory has shocked the country so much as the disclosure, confirmed in the most authoritative manner, of the link of corruption between politicians in power and businessmen and shady characters. The *Press Trust of India* reported in its despatch dated August 28 from New Delhi that the Maharashtra Chief Minister, Mr Abdul Rahman Antulay, had admitted, while briefing Congress (I) MPs from Maharashtra on August 26, that he had collected funds while allocating cement to private contractors in Bombay. These funds had been collected through cheques and not in cash and had been kept in some *private* trusts, like Indira Pratibha Pratishthan, of which Mr Antulay himself is chairman. The funds had been collected also from industrialists and businessmen in Bombay, he added. A portion of the funds had been passed on to the president of Maharashtra Pradesh Congress Committee (I) for party work. Insofar as the Maharashtra Government itself has paid rupees two crores to the Indira Pratibha Pratishthan, any diversion of funds from this trust to MPCC (I) would mean that the government funds were being made use for party purposes.

The point to note is that the Indira Pratibha Pratishthan, incorporated on November 18, 1980 as a private trust headed by Mr Antulay, was inaugurated by no other person than the Prime Minister, Mrs Indira Gandhi, herself at the Raj Bhavan in Maharashtra. In less than a year's time the Pratishthan has collected nearly rupees five crores. As the scandal broke out into the open, Mr Antulay came out with a statement categorically denying the reports of fund collections by him. "There has been no cement deal or any other deal and no favour shown for any donations received," he said on Monday. However, his statement stood contradicted by his then cabinet colleague, Mrs Shalini V. Patil who corroborated the fact of forcible donations by mentioning a specific case of a sugar cooperative, with which she herself is associated.

This affair brings to the fore the harmful consequences of the retention of controls over a very long period of time, against which the Dagli Committee on Controls and Subsidies, appointed by the Government of India, had given a sharp warning in its report published two years ago. "Among the many sources of black money generation, the regime of controls has been an important one," the committee noted. The committee had pointed out that controls hardly helped the consumer and they led to the loss of legitimate revenue to manufacturing companies and the exchequer in various ways. While not providing an estimate of the loss of revenue arising from the existence of the outmoded controls, the Dagli Committee on controls nevertheless stated that "there is no doubt that the magnitude would be substantial".

Mr Antulay's case seems to provide a copybook illustration in substantiation of the observations of this committee. If anything, no one could have anticipated the brazen-facedness with which these corrupt practices could be pursued with reference to controls. Mrs Shalini V. Patil, who has since been sacked by Mr Antulay from his cabinet, stated, while still she was a member of the cabinet, that she had herself "handed over a sum of Rs 21.50 lakhs to Mr Antulay on behalf of the Shetkari Sahakari Sakhar Karkhana Limited of Sangli" without prior sanction from the sugarcane growers of the said cooperative. But the impropriety was not confined to payment without the consent of members of cooperatives. The directors of a cooperative society, which was so sick as to be unable to pay salaries to its staff, and whose members resolved not to pay the donation, nevertheless were coerced into making a donation, but the cheque reportedly was returned by the bank as the cooperative had no funds in its account.

Apart from using the name of the Prime Minister, which was paraded as part of the name of the so-called trust—Indira Pratibha Pratishthan—in whose name the money was collected the whole weight of the State Government machinery was brought to bear upon the collection of funds by Mr Antulay, the Maharashtra Chief Minister, as chairman of the Trust. The *Indian Express* of Bombay prominently published on the front page on September 1 the text of a telegram in which the *Maharashtra Rajya Sahakari Sakhar Sangha* had asked a cooperative to send its donation to the Indira Pratibha Pratishthan, clearly stating that the "Government of Maharashtra requires your cheque positively by 21st instant". According to the newspaper identical telegrams had been sent to all members of the Sangha. The deletion of the name of the Prime Minister, Mrs Indira Gandhi from Mr Antulay's trust which he announced as a defensive measure on Sunday, represents a meaningless action if he continues to remain Chief Minister of Maharashtra and also the chairman of the Trust. While a Chief Minister has the absolute right to choose his cabinet, the dismissal of Mrs Shalini Patil from the Maharashtra cabinet on August 31, in the wake of the furore over the disclosure of the facts of the dubious means adopted to collect funds for a trust, which was so constituted as to give Mr Antulay absolute powers to the extent of overriding even other trustees, can by no means be regarded as an action in keeping with the norms of parliamentary convention. The suspicion is irresistible that Mrs Patil's ouster was the consequence of Mr Antulay's anger over her role in exposing the manner of his fund collection. That Mr Antulay could dare to sack a cabinet colleague under such circumstances even after he had lost all moral authority is a matter of the utmost gravity, so far as the interest of decent government is concerned. It is a tragedy that the Central Government chose in Parliament to defend Mr Antulay's actions and collection of funds.

There ought to be an immediate public judicial enquiry into the matter so that all the facts are established beyond any doubt and the role of the different individuals comes out clearly before the public. At the same time the Government must scrap all such controls which breed corruption and in no case leave the distribution of cement in the hands of politicians and bureaucrats.

New horizons in Indo-French ties

SINCE the installation of the Mitterrand Government, new vistas appear to be opening in Indo-French relations. The French President's socialist tilt strikes, as it were, an ideological chord in this country. Moreover, his declared support to the cause of redressal of the rich-poor global imbalance cannot but strike an emotional chord in a country which has the unenviable position of being a leader of the poverty-stricken world. And yet, as an interview given recently by his Economics Minister, Mr Jacques Delors, to *Newsweek* shows, Mr Mitterrand is no blinkered socialist out to destroy the springs of free enterprise. Equally doubtful is the effectiveness with which he can single-handedly move, especially in view of the trends in the USA and Britain, other members of rich nations' club to adopt a more conscionable stand on the North-South dialogue. Nonetheless the new French Government's image evokes a response in New Delhi which can make for closer relations between India and France. Therefore, the recent visit of the French Foreign Minister, Mr Claude Cheysson, was in the nature of an important follow-up action to build closer ties. Equipped with wit and verbal adroitness, Mr Cheysson charmed his Indian audience and also established good rapport with Mrs Gandhi and Mr Narasimha Rao. Apart from reiterating that France would stand behind the underprivileged world, Mr Cheysson also established with his Indian hosts a near-identity of views on a broad range of subjects including Kampuchea and Afghanistan. The Indian side will pick up the thread of the Cheysson visit when Mrs Gandhi goes to France in mid-November.

In view of the unfortunate arms race in the sub-continent, triggered by the Reagan Administration's obduracy in feeding the militaristic ambitions of Pakistan's military rulers, an offshoot of greater Indo-French affinity on the political plane may be closer collaboration in the field of defence equipment. Already reports from London speak of a deal being under way in Paris for supply to India of 150 Mirage-2000, one of the most sophisticated combat aircraft and decidedly the most expensive at $25 million (Rs 20 crores) a piece. But New Delhi has as yet not said anything officially on the subject. Mr Shivraj Patil, Minister of State for Defence, told the Lok Sabha on August 20 that no final decision had been taken. However, it seems probable that the air arm of India's defence forces will become the first in the world to have Mirage-2000 in its vanguard. France, going by Mr Cheysson's replies at his New Delhi press conference, is ready to sell the plane to India and even eventually produce it in this country. An Indian military delegation is to visit France this September. When the Chief of Air Staff, Air Chief Marshal I. H. Latif, test-flew a prototype of the plane in Paris in June, a spokesman of the manufacturers, Marcel Dassault Aviation Company, expressed optimism that "the deal is sure to materialise". India's concern to step up her air defence to meet the threat from F-16, and reports of annulment of the deal with British Aerospace to make the more sophisticated version of Jaguar at HAL in Bangalore, strengthen the possibility of induction of Mirage-2000 in the Indian Air Force. HAL has had a long-standing agreement in regard to manufacture of Alouette helicopters. Indo-French collaboration also produces missiles and propellants.

Indo-French economic relations need to be bolstered. Despite her size and prosperity, France comes sixth among aid-givers, even after the Netherlands. The government-to-government French credits to India exceed 4 billion French francs (Rs 605 crores). The French aid in 1980-81 was FF 600 million (Rs 92 crores). It comprised project credits for FF 360 million and non-project credits for FF 240 million. The aid figure for this year is Rs 110 crores. President Mitterrand appears keen to take forward the initiative taken by his predecessor, Mr Giscard d' Estaing, when he visited India in January 1980, soon after Mrs Gandhi was voted to power. Notable among the Indo-French projects is the Orissa aluminium complex for which Pechiney-Ugine-Kuhlmann has signed a contract with the National Aluminium Company. In this five-year project of Rs 1,400 crores the French financial participation will be to the extent of Rs 360 crores. In addition, France has helped India to raise a Eurodollar loan of $680 million (Rs 564 crores) from a consortium of mainly French banks. A few weeks ago the Petroleum Ministry renewed, at a royalty of $50 million (Rs 40 crores), the contract with Compagnie Francaise de Petroles (CFP) for consultancy with ONGC in regard to Bombay High, whose crude production is to be raised from eight million tonnes to 19 million tonnes by 1985. Renault is in the running for the Maruti car project. France will also be a participant in the Paradip steel project irrespective of whether it goes to Davy International or Mannesman-Demag, for French companies are members of both the British-led and the German-led consortia, prominent among them being CGEE Alsthom, Fives Cail Babcock and Lurgi France. The Thal Vaishet fertiliser project will have French equipment worth Rs 450 million. Although the Visakhapatnam steel project has Russian collaboration, a Rs 1,200 million rolling mill is to be supplied by a French company called Creusot Loire. Lurgi France will supply equipment worth Rs 87 million to the Kudremukh iron ore project which has Rumanian consultancy.

While French participation in the Indian public sector projects is beginning to lengthen into an impressive list, private sector industrial collaboration has been unsatisfactory. In 1980, only 25 collaborations involving the French were sanctioned, whereas the corresponding figures in the case of the Americans, British and Germans were 125, 110 and 100 respectively. And of these few Indo-French collaborations sanctioned those envisaging financial participation were only five. Although Indian policies are no doubt somewhat restrictive, this has not discouraged the Indo-American Chamber of Commerce from describing India as a fertile soil for business. The number of Indo-German collaborations has also risen to 450. Why are the French lagging behind? Indo-French trade also needs to be expanded and diversified. In 1979 Indian exports and imports were FF 1,472 million (Rs 282 crores) and FF 1,171 million (Rs 224 crores), showing a balance in this country's favour of FF 301 million (Rs 58 crores). In the following year both Indian exports and imports increased to FF 1,490 million (Rs 277 crores) and FF 1,476 million (Rs 275 crores), with the result that the balance in India's favour was nearly wiped out. And in the April-August period this year the position has been reversed, Indian exports being Rs 56 crores and imports Rs 75 crores. The main Indian exports to France are garments and textiles, feeding stuff for animals, precious stones and hides and leather. Prominent import items are aircraft and associated equipment, iron and steel products, engineering products and inorganic chemicals. At the beginning of this year the Indo-French committee on technical and economic cooperation and the Indo-French joint business council independently made recommendations in regard to expansion of trade and joint ventures between the two countries. These ought to be studied by both the governments. Also, considering that 58 per cent of the French industrial production comes from the small and medium sector, there is scope for cooperation between it and its Indian counterpart. A cooperation plan was proposed by France last year.

Some respite in oil prices

WITH a glut in the oil market running at about two million barrels per day the meeting of the Organisation of Petroleum Exporting Countries (OPEC) at Geneva could not have bargained for a higher price from the consumer countries. This glut has come about despite OPEC production dropping to around 22 million barrels per day (bpd) from 30 million bpd early last year, with Saudi Arabia meeting a little less than 50 per cent of the supplies. The glut had already affected some African producers with Nigeria's production dropping sharply from 1.8 million bpd in the early part of this year to as little as 600,000 bpd and Libya's output slumping to 450,000 barrels per day from a level of 1.4 million barrels per day that it planned and 700,000 bpd at least that it would like to ensure for itself to meet the foreign exchange commitments. Following the Geneva meeting and Saudi Arabia's refusal to increase its price beyond $ 32 a barrel, Nigeria has already announced that it was cutting its price by $ 4 from $ 40 a barrel for its premium oil, and it is widely expected that Libya and Algeria will follow in Nigeria's steps. Japan in particular has been trying to bring pressure on its oil suppliers to lower the prices, and if Japan is successful pressure must develop on OPEC from all industrialised countries for reducing the price levels. Industrialised western countries have already reduced their consumption of oil, and in any case, non-communist world's dependence on OPEC oil has dropped from 60 per cent to less than 50 per cent. At the Geneva meeting Sheikh Ahmed Zaki Yamani, the Saudi Oil Minister, was reported to have drawn the attention of his colleagues to the recovery of the dollar and claimed that the correct price for the Arabian Light, the traditional "marker" oil, should be $ 28. But it is unlikely that Saudi Arabia, though unwilling to help in price rise, will contribute to bringing down the levels. If the glut gets accentuated, this may of course come about but OPEC has so far seen to it if that there is no reversal of the price trend.

Oil importing countries have been thus assured of some respite in prices but commentators have been quick to point out that politics proved mightier than economics for OPEC. For instance, the ruling Christian Democratic Party of Venezuela, a founder member of OPEC, was not prepared to give any impression of having succumbed to pressure at Geneva because of the political troubles that the party is facing at home on the eve of elections. The new secretary-general of OPEC, Nan Nguema of Gabon made the significant comment that "on an economic basis we found what looks like a good price but politically we could not agree". This is why it is difficult to predict how long the respite would be and whether Saudi Arabia's stand that prices should remain stabilised throughout the 1982 at $ 32 per barrel will continue to receive support or whether the OPEC's next ordinary conference scheduled for Abu Dhabi in December will change the picture. Writing in *Commerce* only last week the Minister for Petroleum, Mr P. C. Sethi, has expressed the feeling that, though at the OPEC meet in June a price freeze was announced, "the easy supply conditions may be a transient feature only, once the major exporters of crude oil start imposing production cuts to tighten the market conditions". It is presumably because of this assessment that India is not prepared to disturb the contracts with producing countries for supplies of oil, not even contracts with Nigeria and Libya which are charging a premium price. The Government's calculations are that, even with the accelerated programme of production of 30 million tonnes of crude oil by 1984-85, imports of crude oil and products as a percentage of total demand of petroleum products would still remain high at about 47 per cent even though it would have declined from the current level of about 70 per cent. India, on her own account, cannot influence OPEC as regards the price but it must hope that oil consumption in the industrialised countries will be curbed further and non-OPEC oil output increased so as to keep the oil price trend in check.

Setback for jute

By SARAT C. V. NARASIMHAM

THE Bangladesh jute industry, which had made rapid progress and reduced India to a secondary position in the world of jute market with its quality fibres and aggressive marketing policy, has suffered a setback in recent months. With the effective support of its government, the Bangladesh jute industry had made a remarkable progress within a very short period, increasing its market share in world trade in jute from 35 per cent in 1972-73 to nearly 48 per cent in 1978-79. Its planners hoped, according to the data available, to meet a little over 50 per cent of the world demand for the jute goods during the Second Five Year Plan period (1980-85); that is, to say the planners hoped to increase the production and export of raw jute from 60 lakhs to 65 lakh bales. It was estimated that 6.2 lakh tonnes of jute goods would be made available for exports in 1981-84 from the total production of 7.5 lakh tonnes against 4.6 lakh tonnes exported from 5.26 lakh tonnes produced in 1978-79. This compares with the total volume of 1.6 million tonnes of jute fibres and jute goods sold by producing countries in 1979-80 valued at $ 1.1 billion.

The picture, however, has changed since 1979-80 and the planners' calculations promise to go awry. The golden fibre of Bangladesh has, so to say, deteriorated to a great extent in 1980-81. The production targets of both raw jute and jute goods could not be reached and exports showed a downward curve. The Government has also failed to recover taka 215 crores (Rs 100 taka equivalent to Rs 49) sanctioned to jute merchants by the nationalised banks as loans for purchasing raw jute. Added to that cultivated area under raw jute came down to 18 lakh acres during the year compared to the preceding year's 19.16 lakh acres. As a natural corollary production of raw jute was not up to the mark. In the meanwhile the jute experts estimated production of raw jute at 6.11 lakh tonnes, which was, however, 5.80 lakh tonnes — far below their expectation. The government also fixed an export target at 5.30 lakh tonnes during the year, whereas the actual export demand was limited to about 5 lakh tonnes only.

Because of aggressive salesmanship shown by Bangladesh jute traders, the country exported 4.58 lakh tonnes of jute in 1978-79 and earned taka 419.90 crores. This was about 51.57 per cent of the total world export, while India showed an all time low figure during the same period. Many reasons were attributed for this decline such as shortage of inputs like power, coal, diesel, prolonged strikes in jute mills, continued trouble in Calcutta port etc. Owing to these factors, a spokesman of Indian Jute Mills Association (IJMA) explained, the total loss suffered by jute export trade was Rs 136.5 crores out of annual export valued at Rs 272 crores. Add to this, he continued, the introduction of export duty of Rs 1,000 per tonne on hessian goods which affected the outstanding contracts. This is of course the picture as depicted by Indian side during the corresponding period.

The plight of Indian jute in 1978-79 is being repeated in Bangladesh in 1980-81. It has exported 3.61 lakh tonnes of jute up to March 1981 which is 46.88 per cent of the total export of world market. According to Bangladesh sources, the private sector exporters handle nearly 90 per cent of exports of raw jute. The target of raw jute export has not been met during the last few seasons because of failures of the private sector traders to carry on their business due to serious fund constraints. It may be mentioned here that the Government of Bangladesh sanctioned about taka 300 crores last year to the jute traders in both public and private sectors of which about taka 220 crores remained to be recovered from them. It was stated that they could not repay the credit due to their failure to export superior quality of raw jute since the market arrivals were generally of inferior quality. Besides the quality of raw jute and cuttings, the carry-over from the preceding year stood at 33 lakh bales. Private jute traders reportedly had more than 15 lakh bales unsold stocks, while the balance has been piled up in the warehouses of Jute Trading Corporation and Bangladesh Marketing Corporation.

Out of 33 lakh bales of carry-over jute, more than 26 lakh bales are of very inferior quality which are neither in demand abroad nor in the local jute mills. Add to that, last year the Government constituted a buffer stock of 4.07 lakh bales of raw jute and cuttings under Bangladesh Jute Marketing Corporation, and another 2.27 lakh bales under the management of Jute Trading Corporation.

This year the farmers also did not take much interest in cultivating jute as the government failed to fix any minimum price for their products last year and some of the farmers chose alternative crops which could assure them easy and sure price. Besides, it was also stated that the government failed to distribute adequately high yielding seeds among the cultivators. The seeds supplied by the government were of very low quality. According to informed sources, in many places, one seer of jute seed was sold at taka 30 to 36 instead of taka 18 as fixed by the government. As a result, many of the farmers particularly in the districts of Mymensingh, Dacca and Comilla did not cultivate jute. The sources further said that in these districts the production of jute had fallen by 2 per cent compared to preceding year.

Bangladesh jute has been passing through a crisis as a result of governmen'ts non-fixation of minimum price. Subsequently last year raw jute prices in the country registered a sharp fall. The price of one maund of jute was sold at taka 129.92 in the month of July 1979, while it came down to only 79.20 per maund during the corresponding month of 1980. It, however, recovered to taka 118.71 in the month of March this year. Ironically, the same was selling at more than taka 186 per maund in the month of 1978!

What ails the Indian economy and polity?

By M. S. PATWARDHAN

A one sentence answer to this question might be that slow economic growth, a plethora of government controls, rapidly growing population and rising expectations which exceed available resources are the main causes of the prevailing malaise. Although it has a substratum of truth, this is a simplistic explanation at best. A better understanding of the problem and suggestions for possible remedies require a deeper examination.

What are the facts? Over the period from 1950 to 1980, India's GNP has grown at an annual compound rate of 3.6 per cent, which compares with 1.3 per cent over 1900 to 1950 (Source : *National Income of India: Trends and Structure* by M. Mukherjee). Industrial production has increased at the not unimpressive rate of 6.1 per cent per annum over the three decades from 1950. What is more, the range and sophistication of industrial output have grown enormously and compare well with the more advanced developing countries. India ranks as the tenth (according to some estimates, seventh) largest industrial power in the world.

A few years ago it was customary in international forums to suggest that India could never become self-sufficient in food and feed its teeming millions. With the green revolution, the picture has changed dramatically and India is now the fourth largest grain producer in the world. It has built a large inventory which means that one or possibly two consecutive droughts should not mean a serious famine of the proportions to which history had accustomed us.

The volume and range of exports have gone up taking the total to Rs 6,425 crores in 1979-80, as against Rs 601 crores in 1950-51. After over two decades of foreign exchange stringency, the reserves stand at over Rs 5,000 crores, a level which was almost inconceivable a decade ago. The savings rate has gone up from 6.8 per cent of the national income in 1950-51 to 23.5 per cent of GNP in 1979-80.

Life expectancy has increased from 33 in 1941-50 to 53 years in 1976-80. Literacy has gone up correspondingly from 17 per cent in 1951 to 30 per cent by 1971. India now has the third largest pool of scientists and engineers, next only to the USA and USSR. Very impressive advances have been made in the technical fields of nuclear energy and space research. These achievements are clearly impressive. What then accounts for a feeling of failure and disillusionment? Is it a perverse travesty of the facts engineered by devious politicians and by India's detractors? The main explanation lies in :

(i) the rapid growth of population;

(ii) a comparison of our performance with the underlying potential and with the achievements of other developing countries; and

(iii) rising expectations which have kept a step or two ahead of our performance.

Growing population

The population has grown from 358 million in 1950-51 to over 684 million by 1981. The annual compound growth rate in population of over 2 per cent has largely eroded the per capita growth in GNP to 1.4 per cent per annum over 1950-80. Despite impressive economic growth in absolute terms, nearly half of India's population remains below the poverty line as defined by a modest per capita monthly expenditure of Rs 65 in rural and Rs 75 in urban areas at 1977-78 prices. Although grain production has gone up impressively, it is a measure of the country's failure that the poor are unable to buy the grain necessary to take them above the poverty line defined in terms of calorific intake; very limited progress has, however, been made with Food for Work as a means of ameliorating rural poverty.

The availability of natural, human and other resources in India, the genius of the people and the size of the pool of engineers and scientists which is the envy of many developing countries together imply that with better organisation and leadership, it should have been possible for us to achieve higher economic growth rates in line with those of South Korea, Taiwan, Malaysia, Brazil, etc. The problem of rising expectations has been referred to later in this paper.

Why did this economic advance not come about? Apart from the failure to control the growth in population, it is significant that in most of the countries cited above for comparison, greater recourse to the market mechanism, as opposed to a more dirigiate approach on the Indian pattern, has been adopted. Emphasis on heavy industry in the Mahalanobis era, comparatively less importance to agriculture and wage-goods manufacture till recently, reliance on controls, licences and permits, doctrinaire insistence on the public sector as the main instrument of industrial and economic development, high levels of taxation together with unrealistic controls which have led to a thriving parallel economy are some of the reasons why our performance compares unfavourably with some other countries. It is true that our limited achievements have been brought about within a democratic political framework, while most of the countries which have outperformed us in the developing world have done so in less democratic environments. This is a fact we can be proud of but it does not lessen the frustrations and disillusionment attributable to poor economic performance. Indeed in a democratic set-up, the expression of this disenchantment will obviously be more manifest, particularly so in the light of expectations built up on the heady diet of populist slogans.

Are we then condemned forever to a policy-mix which brings neither economic growth nor social justice with the inevitable consequence of societal collapse? What are the main impediments to achieving faster economic growth in the near future without which we cannot hope to make progress towards social justice? The following thoughts might help to focus attention on the bottlenecks and to suggest possible solutions.

Three major constraints

The country now faces three major categories of constraints—physical, financial and societal. They are interdependent and have some overlap among them. The first two, the physical and the financial constraints, are relatively simple to understand, analyse and deal with. However, societal constraints, to the extent they depend on human psychology and attitudes are much less comprehensible and more difficult to cope with.

Physical constraints: What are the physical constraints ? An obvious example is the shortage of infrastructure. In

---

Mr Patwardhan, managing director of NOCIL, is a former president of the Bombay Chamber of Commerce and Industry.

the short term, that is in the next year or two, the only way the industrial sector can advance is through elimination of infrastructural bottlenecks. In some ways this represents a plus point in that if industry had been working at full capacity, further industrial growth would have been impossible in the short run since it takes considerable time to establish fresh capacity. However, we have plenty of idle capacity and not all of it is being put to use as a result of shortages of coal, electricity and transportation.

What should be industry's response in these circumstances? We should, of course, conserve energy. But more than that, we need to appreciate and consider the challenges we face in increasing coal production from about 100 million tonnes now to over 400 million tonnes a year by the end of the century, and in increasing power generating capacity from 30,000 mw to more than 110,000 mw during the same period. These tasks are stupendous and there is no way in which the public sector, with the best of management and the best will in the world, can fulfil them. Indeed there is no alternative to the private sector playing a complimentary role in achieving these targets. How can the Government be persuaded to accept this reality? This is a subject to which the leaders of private industry should address themselves.

Paralysis by analysis: The next class of constraints we should recognise relates to the paralysis in decision making; although the constraint is not in itself physical, its repercussions delay physical action. Somebody has described this as paralysis by analysis and deferment by committee. We also have bureaucratic and procedural bottlenecks, which are a serious impediment to industrial and economic growth. Decision-making is slow and when decisions have been taken the follow-through is lacking. Two consequences follow. The first is very serious cost escalation. There was a news report a few months ago that the delay in deciding on the two Gujarat and Maharashtra fertiliser plants has cost India some Rs 400 crores already. With every year that passes, prevailing inflation leads to a severe penalty in the form of project cost escalation of 15 to 20 per cent per annum with its inevitable impact on the capital-output ratio.

Lost opportunities: An even more serious consequence is the lost opportunity. A good example is the delay in the exploitation of the Bombay High gas and the national loss it has given rise to. Whether or not to have a petrochemical complex, whether to have one in Gujarat and one in Maharashtra, of what size it should be, where it should be located, should it be in the public sector, private sector or joint sector—these decisions are eluding us for too long. In the meantime, we are willy-nilly accepting that some of the gas, which will inevitably be produced along with crude oil will be consumed in an uneconomic way. This example highlights the adverse impact of decision-making delays.

Financial constraints

Among the second category of constraints, namely financial, the foreign exchange crisis tops the list. The true dimensions of the oil squeeze and the intolerable burdens it will cast on our resources in the coming years have not yet been fully grasped. The Iran-Iraq hostilities as a result of which three-fourths of our crude supply has been cut off in the short term gives us a foretaste of potential threats, to our economy from 'accidents' of this type. It is apparent that we are going to find it increasingly difficult to import our oil needs in the years ahead. This highlights the importance of conserving energy and finding our own oil. The recent decision of the Government to attract foreign oil companies to supplement our own efforts is welcome in this respect; it is also necessary to recognise that it will be necessary for us to offer terms which are competitive internationally taking account of geological prospects. But this initiative will not be enough and we need to do a great deal more to expand the range and volume of our exports.

Capital-output ratio: The second financial constraint that causes concern is the rising capital output ratio. What can we do about it? Should we change our economic, industrial and planning priorities by concentrating even more on agriculture, agro-based industries and wage goods manufacture? These are usually less capital-intensive, have shorter gestation periods, generate considerable employment opportunities and can help step up exports. If we were to increase our production of wheat, rice and sugar by a million tonnes each and of cotton by a million bales, we could generate more than Rs 100 crores to Rs 200 crores per annum of exports in respect of each item. We should seriously consider restructuring our priorities—in any case, such a step is shortly going to be forced on us by the shortages of capital and foreign exchange.

Difficulties in resources mobilisation: A third financial constraint relates to the problem of resource mobilisation. The nationalised banks, life insurance, general insurance and the Unit Trust are owned and controlled by the Government. People's savings in the form of CDS or provident and superannuation funds are statutorily required to be invested in government securities. In addition, we have high levels of taxation and high rates of inflation, which together mean that that the urban middle class sector has lesser savings available for investment, particularly in equity. Official statistics show high domestic savings. Where they go is not obvious. Perhaps they find their way into the parallel economy or into gold, property and high interest-bearing company deposits. Obviously, hard-earned personal savings would not go into the corporate sector, where returns are poor as a result of constraints on capacity growth in the larger companies, licensing, pricing and taxation policies as well as infrastructural bottlenecks.

So long as the available resources are largely with government agencies and the private corporate sector's access to domestic savings is limited by a whole range of restrictive policies, there is a real problem for the corporate sector to raise equity funds particularly when prevailing rates of interest on company deposits and elsewhere are higher. We have to consider these questions not from a sectional point of view but from that of the country. How can we attract private savings to the corporate equity sector? Pending urgently needed structural changes in respect of administered prices, taxation and licensing policies, 'free' depreciation for fiscal purposes, tax relief on stock profits broadly on the UK pattern and greater recourse to public deposits might improve the private sectors' cash resources for investment and growth.

Government shareholding in private companies: Another possible solution is to re-examine the structure of our corporate sector. If we leave out the FERA companies, the majority of the larger companies in India have a public sector share-holding of somewhere between 10 and 30 per cent. There are even companies like TISCO where the government or public sector shareholding is more than 40 per cent. With prevailing fiscal and economic policies and the pre-emption of a great deal of finance in the public sector described earlier, these percentages are going to rise in the future. This really means that the distinction between the private and the joint sector, if not the public sector, is blurring with time. Many of the corporate bodies which have been looked upon as private sector companies are in reality joint sector companies. They have government nominees on their boards of directors. An institution like TISCO, for example, is essentially a government company although the government has wisely left it to be managed by the private sector. A comparison of TISCO's performance with the high capital-output ratio or low return on investment of the public sector undertakings and steel plants in particular shows the advantages of the former pattern.

It is not suggested that the best managers in the public sector are less efficient than the best managers in the private sector. The fact is, however. that with bureaucratic control, ministerial interference and parliamentary intervention, there is no way that the best managers, whether from the private or the public sector, would be able to produce the sort of results that the country has the right to expect from the national investment in public sector industry. The real challenge is to combine the resources in the public sector and the autonomy and management culture of the private sector without the strait-jacket of governmental regulation. If we can bring this about by separating ownership from management, we can find some way of increasing our industrial output as well as reducing the capital-output ratio.

Societal constraints

The question of societal constraints is perhaps even more important than the other two constraints mentioned earlier. We are passing through a period of instability, agitation and unrest. Owing to years of poor economic growth, massive educated urban unemployment and inflation, societal pressures have reached formidable proportions. Widespread education, the extensive reach of the media and the demonstrative effects of TV and the cinema have led to rising expectations to the point of an aspiration explosion. This is a highly explosive mixture and the result may be perceived in the shape of troubles in Assam, farmers' stir, students' agitations. and strikes and lockouts in industrial establishments. Bandhs are taking place every other day, the law and order situation is deteriorating and every pressure group is involved in agitating to improve its relative position. These agitations have triggered off serious consequences because our economy has become so complex that there is a great deal of interdependence. A small group, say, power station workers can hold the whole community to ransom by withholding their labour, going slow or even committing sabotage. Agitational methods have become self-perpetuating because almost every agitation is succeeding. All one has to do is to agitate and one's demand is conceded.

Industry response

What should be industry's responsibility? Should industry spend its time on creating more employment for the urban educated? Should it engage in slum relief operations? Should it spend more time and money on pollution abatement than the minimum standards specified by law? What is its responsibility for increasing employment in the rural areas? Should it take up projects for rural development? How should these activities be reconciled with corporate goals and return on investment objectives, particularly in the context of industry's low profitability and the plethora of constraints it operates under? Does it have the power, ability and will to do so? These are some of the issues we have to find answers to if we are to survive.

Conceptually all these problems have two dimensions. There is a technical dimension and a human one. As a society and as a country we usually have solutions on the technical plane. The problems are understood intellectually, the solutions are known but we lack the necessary will and leadership to implement them. We have somehow to find a way of strengthening our skills and motivational efforts in dealing with the human dimension. Without such a step, the nation's productive processes will continue to suffer and so will the country's economic growth, progress towards greater social justice and indeed the prospects of survival as an orderly, healthy and civilised society.

Gold and silver price maze

From OUR SPECIAL CORRESPONDENT

BOMBAY

ON August 19, the prices of gold and silver recorded sharp increases in the Bombay market. The price of gold rose by Rs 38 to 1,775 per 10 gm and that of silver by Rs 40 to Rs 2,790 per kg. The sudden rise in the prices of these precious metals was caused by paucity of supplies.

While silver was reportedly being diverted to Gujarat, the seizure of gold in recent weeks aided the bullish trend, with the unofficial price of gold biscuits of 10 tolas going up from Rs 18,700 to Rs 20,400. On August 22, the closing prices of gold and silver in the Bombay market were Rs 1,745 per 10 gm and Rs 2,765 per kg respectively.

In the London market too, the price of gold rose sharply on August 19. After opening at $ 429.50 per ounce, it rose to $438 on the news of the US shooting down two Libyan planes. At $431.50, the closing price of gold in the London market represented a gain of $14 over one week. There was a gain of almost $40 in two weeks but on August 25 the London price retreated to $ 419.50 with the dollar showing a recovery.

For quite some time now, prices of gold and silver, both in India and abroad, have been exhibiting sizable fluctuations. In the last days of 1979 and the first few days of 1980, the Bombay market had witnessed skyrocketing silver prices. Silver had opened in the Bombay market at Rs 4,000 per kg on January 1, 1980, which represented a jump of Rs 558 over the closing price of Rs 3,442 on December 31, 1979. On January 1, 1980, silver had closed at Rs 4,108. In the first week of January 1980, the price continued to rise till January 9, when the closing price was Rs 4,933. However, soon after that the price started declining and the closing price of January 1980 was Rs 3,225. The lowest silver price of 1980 was reached on May 19, 1980 when the price was Rs 2,075. The year 1980 had closed at Rs 2,825.

Silver had resumed in 1981 at Rs 2,845 per kg and initially the prices rose and reached the level of Rs 2,855 on January 6, 1981. However, the prices then drifted to a low level of Rs 2,320 on July 8, 1981 but rose again to Rs 2,790 on August 19, 1981. It may be noted that notwithstanding these ups and downs, prices of silver in the Bombay market in the middle of August 1981 were lower than their levels in the beginning of 1981.

In the London market, silver price had reached a peak of 829.45 pence per ounce on November 28, 1979. By March 28, 1980, the price had come down to 644.70 pence. On March 26, 1981, the silver price in the London market at 499.5 pence marked the lowest level in a year. On August 19, 1981, the price of silver on the London market was 531 pence per ounce.

Gold had resumed this year in the Bombay market at Rs 1,695 per 10 gm but dropped to a low of Rs 1,590 on March 12, 1981. Prices firmed up on

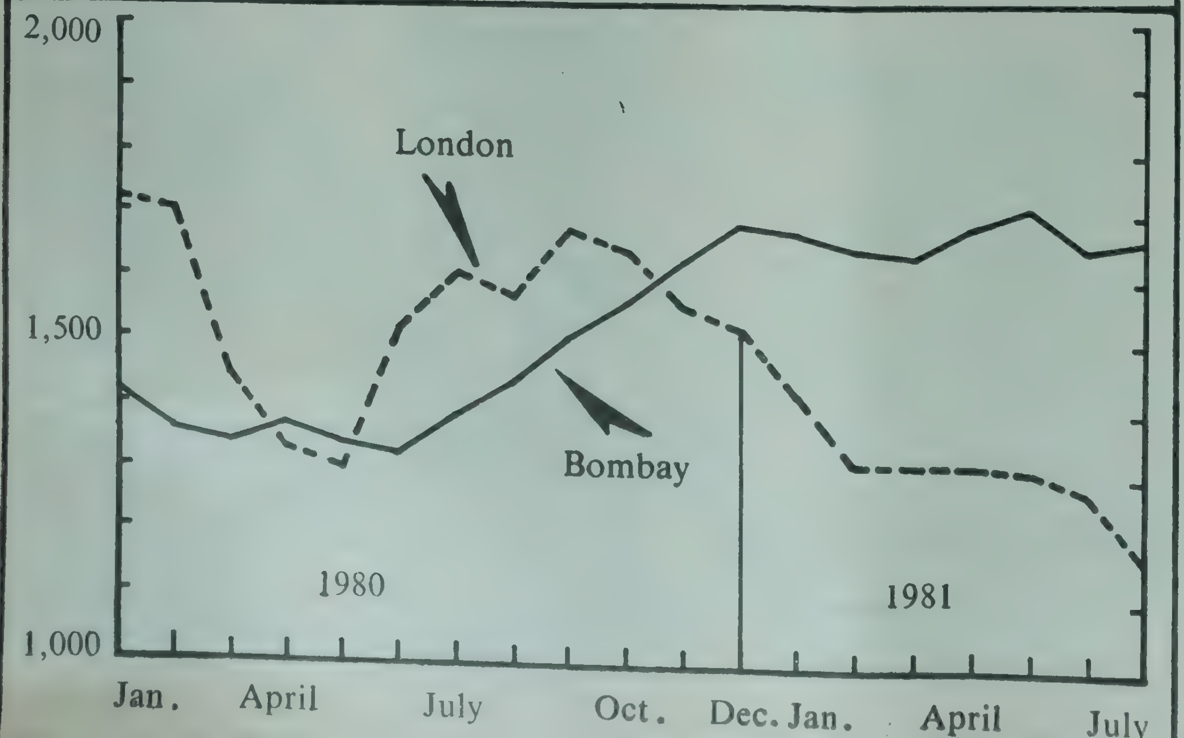
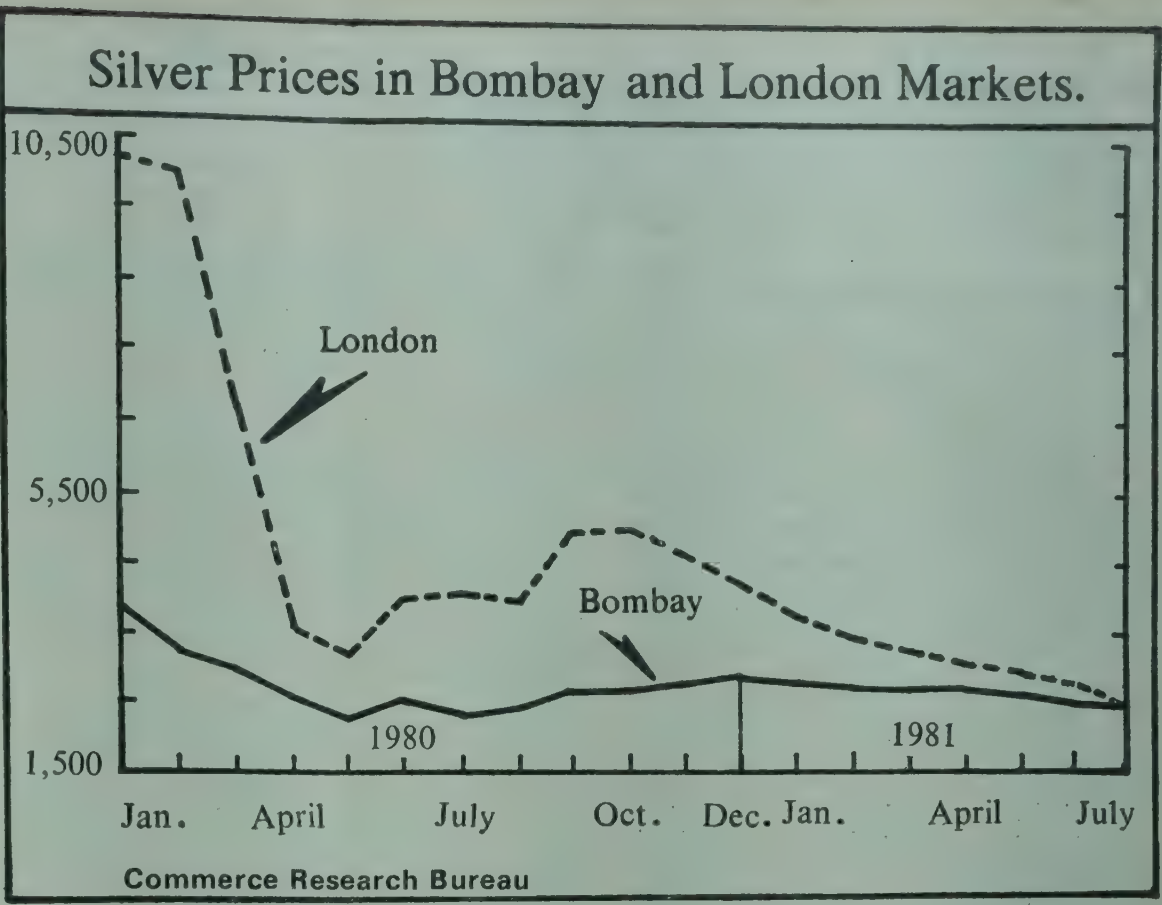
Gold Prices in Bombay and London Markets.



were lower than their level at the beginning of 1981, gold prices touched a new peak on August 19, 1981 at Rs 1,775.

In the international markets, gold prices had touched the peak of $850 an ounce in January 1980. However, by the first week of August 1981, the prices had crashed through the psychologically important level of $400. On August 4, 1981, the closing price of gold was $392—a fall of $14 over the previous week. Besides, it was only the second time that the price of gold had fallen below the $400 level, the first instance having been witnessed on July 8, 1981. The closing price of gold on August 4, 1981 was less than half of that in January 1980.

The growing strength of the American dollar was the main reason for the fall in gold prices. During the first week of August 1981, the US dollar had moved up to its highest level for three years against sterling, for five years against the deutschemark and for 23 years against the French franc.



Silver Prices in Bombay and London Markets.

Commerce Research Bureau

The growing strength of the US dollar had also its effect on silver prices. But there was no further fall even though the US Congress approved in July 1981 the sale of 105 million ounces of silver between 1982 and 1984—46.5 million ounces in 1982, 44.7 million ounces in 1983 and 13.8 million ounces in 1984. This approval was subject to the stipulation that the sales cannot be made if they disrupt the market, and that the quantity which is not sold in the stipulated year must be returned to the Government stockpile. In view of the already falling prices of silver, the market expectations were that the stipulations cannot be fulfilled, and hence there were doubts about the implementation of the plan.

Traditionally, the silver price in the London market has been higher than that in the Bombay market. In the year beginning with July 1, 1980, the highest difference was reached on September 22, 1980 when the London price of silver was higher by Rs 3,132 per kg than the Bombay market. Nevertheless, since September 1980, the price difference has been narrowing down. In fact, on July 27, 1981, the trend was reversed and the Bombay price of silver at Rs 2,520 a kg was Rs 88 higher than the London price of Rs 2,432. In July 1981, the average difference was only 0.5 per cent.

Though export of silver from India has been banned with effect from February 20, 1979, unauthorised exports of this metal have reportedly taken place on a large scale in 1980. According to the estimates made by Messrs Handy and Harmon of USA, 25.7 million ounces of silver had been exported from India in 1980 which was 11.2 million ounces higher than that in 1979. It is also pertinent to note here that the quantity of silver seized by the customs authorities all over India while being attempted to be smuggled out of the country was the highest in 1980— 30,390 kg as compared with 5,396 kg in 1979 and 598 kg in 1978. In the first two months of 1981, 2,582 kg of silver were seized. It is obvious that such large exports of silver could not have taken place but for a sizable difference in the prices between the London and Bombay markets. The average difference between the prices in the London and the Bombay markets during 1980 was as high as 85.7 per cent. However, in 1981, the price difference has come down and was only 18.0 per cent in the first seven months of the year.

As far as gold is concerned, its price had been higher in the Bombay market than in the London market, till the end of 1979. However, beginning with 1980, the situation was reversed and the London price of gold became higher than that in the Bombay market. With a few exceptions, this position continued till October 1980. Beginning with November 1980, the situation again reversed itself,

COVER STORY

Emergence of financial managers

By Y. C. SHARMA

GONE are the days, when companies used to float their capital issues with the help of a team of brokers under the leadership of one managing broker and the collecting bankers. Now every public issue must have name of at least one reputed bank or financial consultancy firm for the job of the manager of issue. Further, there is an impressive array of other specialised agencies to look after various aspects of capital issues of the companies. This change in the style of capital issue has no doubt been necessitated by a number of new factors which have emerged in the economy of the country. With fast industrialisation, and development of entirely new types of sophisticated industries requiring huge capital, the capital issue work was bound to become more and more specialised, creating a distinct place for the financial consultancy institutions which could manage the issues with proficiency, and success. Merchant banking (MB) provides the package of services to take care of all matters pertaining to the capital issue, legal, financial commercial, and secretarial.

Growth in India

Merchant banking was born in 19th century in UK, and slowly and gradually it developed into a powerful instrument of providing institutional finance to the needy companies and firms. It is in its infancy in India even late in the 20th century. It is quite natural because the industrial expansion picked-up speed only after Independence. Grindlays Bank was the first bank to start merchant banking in an organised and systematic manner in India in 1969. The then chairman of the Grindlays Bank, who had purchased one of the important merchant banks of UK, "Brandts", perceived the great potentiality of merchant banking in India in the context of fast changing economic scene after independence.

Many foreign companies operating in India were keen upon Indian participation in their capital, and Grindlays Bank with its merchant banking division could help them to achieve this objective easily with the rich experience in merchant banking of its associate, Grindlays Brandts of London. The bank as a member of "Accepting Houses Committee" could also exercise its influence in obtaining foreign loans for the Indian companies. It could also manage to arrange British Government export credit for the Indian companies, and provide expertise to secure Euro-currency loans.

Some other foreign banks like Citibank and Chartered Bank followed the suit in starting merchant banking activities in India. The Mercantile Bank, which started its merchant banking division in 1978, also had the advantage of arranging foreign currency loans for the Indian companies without much difficulty, because of its close relationship with the powerful Hongkong Bank group.

The Banking Commission made a strong recommendation for starting merchant banking institutions in Bombay, Calcutta, Madras and New Delhi. However, instead of starting separate merchant banks, the State of Bank of India, the biggest and oldest among the commercial banks of this country, took the lead in starting merchant banking division in 1972. It was closely followed by the Industrial Credit & Investment Corporation of India, the premier financial institution in the field of corporate finance, which started its organised merchant banking activities in 1973. Other Indian banks such as Bank of India, Central Bank of India, emulated the example of State Bank of India in the next six years, and about half a dozen more nationalised banks e.g. Indian Overseas Bank, United Commercial Bank, Punjab National Bank, etc are also reported to be taking steps to start merchant banking divisions of their own.

Role of stock-brokers

The stock and share-brokers in India, particularly at Bombay, have also been playing an important role in public issues of the companies, and some of the old and well-established broker-firms used to work as the "managing brokers" of these public issues. They were also doing under-writing business. Some of the leading broker-firms of Bombay were quick to see the great scope for the merchant banking business of India. They decided to develop their new professional image of specialised and competent financial consultants, different from the usual image of stock brokers as some sort of intermediaries. One by one, four leading broker firms of Bombay set up separate financial consultancy firms in order to exclusively cater to the financial requirements of the client companies. The setting up of separate financial consultancy firms also enabled them to carry on their new business in a congenial environment without any hindrance or restrictions.

In this context it may be pointed out that as members of the stock exchange, the broker-firms are, as a part of business ethics, barred from doing any publicity for themselves, and this naturally restricted their activities, which were sought to be widened in the context of growing specialisation in the field of financial consultancy. HL Financial Consultants and Management Services Pvt. Ltd. (FICOM) floated by the well-known broking-firm, Harkisondass Lukhmidass, was the first to enter the field of merchant banking in 1973. Almost simultaneously J.M. Financial and Investment Consultancy Services Pvt. Ltd. was floated by another wel-known broker firm Jamnadas Morarji. Later on, DSP Financial Consultants Ltd. and Champaklal Investment and Financial Consultancy Ltd. (CIFCO) also came into the field under the sponsorship of D. S. Prabhoodas, and Bhupendra Champaklal Devidas respectively. The latter two financial consultancy (FC) companies are regular public limited companies, while the other two are private limited companies. Apart from these better known FC. companies, a number of share-broker firms are also running their respective financial consultancy units.

The merchant banking divisions of the commercial banks financial institutions, apart from their goodwill and prestige, enjoy distinct advantage of having access to bank's funds, which could be lent to their clients, and also the ability to ensure underwriting of capital issues by the banks. However, the financial consultancy companies, which are the offshoots of the reputed share-broking firms, also enjoy the special advantage of having a very close rapport with the market through their associate share-broker firms and getting the issues

SEP 1981

underwritten by them, as well as enjoying the confidence of the client companies and investing public alike. However, these advantages cannot be the exclusive basis to secure business from the clients, and the quality of service rendered, capabilities and attitude of their respective executives, as well as the results achieved also play equally important role in developing the individual image of the merchant banking divisions of the banks and financial consultancy companies.

Concentration in western region

It may be observed that at present there is concentration of merchant banking activities in the western region of India, with main offices of the merchant banking divisions of banks and the financial consulting companies in Bombay only. The obvious reason for this development is that the head-offices of most of the commercial banks and other financial institutions such as ICICI, LIC, UTI and IFCI and IDBI etc, playing crucial role in providing term-loans, underwriting services, and even subscribing to the capital issues, are in Bombay only, and it facilitates the merchant banking banks/companies to attend to various matters more expeditiously and promptly through personal contacts with the officials, who are in a position to take final decisions. Moreover, Bombay is the most affluent metropolitan city of India, where the largest investible funds are available. The location of the head-offices of the MB divisions of banks and FC companies in Bombay enables them to carry on their campaigns more intensively in this city.

However, slowly and gradually some financial consultancy firms are coming up in places like Delhi, Calcutta, Madras, Ahmedabad Hyderabad and Bangalore also. The growing importance of these cities from merchant banking angle is being realised by the banks and FC companies as well. The State Bank of India has established six bureaus in Bombay, Delhi, Calcutta, Madras, Ahmedabad and Hyderabad as the extended arms of its merchant banking division to tap the local business and do some sort of spade work for the head office. Similarly, the Grindlays Bank has also its branches in Delhi, Calcutta, and Madras (proposed). FC companies are also not lagging behind, and FICOM, JM Financial Consultants and DSP Financial Consultants are also having their branch offices in a number of big cities of India, though these offices at present are concentrating mainly on collecting fixed deposits for the client companies.

Services rendered

There are a number of services, which MB divisions of banks, and FC companies aim at rendering *e.g.* capital issue management, tying of financial accommodation, and syndication of loans, in local currency as well as foreign currencies, Indianisation of FERA companies through dilution of foreign shareholders, corporate counselling including restructuring of capital, project planning, liaison with government and semi-government bodies as well as the financial institutions, management of fixed deposits, and portfolio-management, etc. However, as the sophisticated MB activities are yet to take roots in India, capital issue management, credit syndication and underwriting work, predominate at present so far as merchant banking divisions of the banks are concerned, while FC companies are paying maximum attention to the collection of fixed deposits for the client companies along with the management of capital issues, loans syndication, and underwriting business.

Two FC companies have also successfully organised portfolio management services for the individual investors. *FICOM* and some other FC companies are publishing monthly magazines for tendering advice to their clients regarding investment. The MB divisions of banks and companies have to keep themselves abreast with the latest market trends in the fields of finance, economics and politics in various countries particularly India, the latest government policies affecting economy, and the mood of the investing public, in order to render timely and efficient services.

Under merchant banking some sort of personalised services are required to be rendered to the client companies, and a confidence has got to be created in their mind about the competence of the MB divisions/FC companies to deal with the intricate financial matters, as well as their capability to protect the client's interests. This totally reverses the role of the commercial banks, which are used to adopt the lender's attitude of superiority. In the course of carrying on merchant banking activities, the officers do no more represent their respective banks but their clients, and they have to invariably plead the case of the clients with the financial institutions, for funds and other services. The main objective of MB is to render financial consultancy and management services in a better, quicker, manner cutting time to the minimum, and thereby saving money and botheration for the client.

The range of services rendered by the MB divisions of banks and FC companies differ from client to client. While some of the client-companies entrust the entire responsibility, right from the stage of project formulation to the management of capital issue, some others approach them only for the issue management utilising the services of outside financial consultants for preparing the project profiles. Some of the big industrial houses have their own arrangements for project planning and financial tie-ups, and they also approach MB divisions/companies for the purpose of issue management only.

Organisational set-up

In order to render various consultancy and management services to the entire satisfaction of the clients, the MB divisions of banks and FC companies have to employ an impressive team of experts in various fields of knowledge, particularly financial management, corporate finance and accounts, and company law. These officers are highly qualified and experienced persons, with proper attitudes, capable of tactfully dealing with well-informed and experienced company executives, and convincing them of the merits of the point of view of the former. The teams include the company secretaries, MBAs; CAs, cost accountants etc specialist in company law and secretarial practice, banking, cost accounting, corporate finance, and marketing etc. Sometimes even the engineering experts are appointed by the MB divisions/FC companies to advise on technical matters. The MB divisions of various banks as well as the FC companies were reported to be having as many as 4 to 18 expert executives looking after a number of specialised jobs pertaining to merchant banking. In the banks, the officers selected for MB division were not only experienced in various aspects of commercial banking but also well oriented and trained in MB. Already certain short-term courses of 6 to 10 days' duration are being organised by the Reserve Bank of India, some of the nationalised banks, as well as some management institutes for the benefit

COVER STORY

any fear of exaggeration that they have fulfilled their objective during the short period of their existence in more than one way. They have been rendering effective professional advice, and managing capital issues successfully year after. The MB/FC concerns have been in a position to cut short the time required for the project planning, loan syndication, and capital issue etc resulting in substantial economy, and convenience to the client companies. Their advice regarding scientific structuring of capital of the client companies, and maintaining optimum debt equity ratio, have helped the client companies to increase their profitability through optimum use of different types of capital. The imaginative publicity, planned and executed under the guidance of MB divisions/FC companies, has resulted in creating a very favourable climate for investment, unknown is the past. One of the reasons for over-subscription of most of the public issues is certainly the well-conceived strategies and pragmatic approach followed in implementing the plans pertaining to various capital issues. It may be of interest to mention that the public issue of Hindustan Development Corporation debentures managed by the Grindlays Bank created a history in the field of capital issue by getting the issue over-subscribed 72 times, despite the fact that initially the company was little known in the Bombay circles.

The MB/FC concerns have played a positive role in creating a new awareness amongst the middle-class investors, and persuading them to invest their surplus money in profitable avenues, such as non-convertible or convertible debentures, equity shares, and fixed deposits. As a result of this the ownership of equity capital of many companies has been made much more broad-based.

It will be worthwhile to highlight a few salient features pertaining to the recent public issue of equity shares of the Gujarat Narmada Valley Fertilisers Co Ltd, which was managed by as many as five financial institutions and FC companies under the leadership of Industrial Credit and Investment Corporation of India Ltd. This was the largest ever (nearly Rs 43.60 crores) equity issue in India. It was a matter of great challenge to the managers of the issue to make a success of this public issue, despite some of the adverse circumstances, particularly the unfavourable image of many fertiliser companies in India resulting from their recurring losses year after year. Further, it was entirely a new company without any history or background, and investors had to take decision only on the basis of their estimate of economic viability of the company's project. But all the managers of GNVF's public issue did a commendable job as a harmonious team, and it is creditable that despite the capital issue being very big, it was over-subscribed 4.1 times.

For the first time an organised and concerted effort was made by the Bank of Baroda to mobilise the rural savings in a big way for the equity capital of this company, and it is indeed remarkable that from Gujarat alone, where Bank of Baroda has a network of rural branches, as much as Rs 12 crores could be collected by way of application money, while from rural areas of other states further Rs one crore were collected. Again, mainly due to efforts of Bank of Baroda and SBI; collection from the non-resident Indians working abroad by way of application money for GNVF Co's shares was also very sizable, amounting to Rs 9.6 crores. Particularly, Indians working in West Asia were approached through the foreign branches of the banks and were persuaded to apply for the equity capital of GNVF Co. It may be recalled that once earlier also, in case of the public issue of convertible bonds of TELCO, there was appreciable non-resident Indians' participation.

It is obvious that the awareness about the useful role, MB plays in the context of vast industrial expansion of India by offering complete package of financial services, is increasing fast in the corporate sector, and more and more nationalised banks as well as FC firms are coming forward to participate in the expanding merchant banking business. At present, all the well established FC companies seem to be doing roaring business, and there is no dearth of work for them. Though there seems to be sufficient scope for fuller utilisation of the merchant banking facilities created by the nationalised banks, the future of the merchant banking business seems to be quite assured in view of the fact that present government policy aims at encouraging the corporate sector to depend more and more on the funds raised from public, rather than from the financial institutions.

Further, the process of Indianisation of the FERA companies is still on, and these companies are quite likely to utilise the services of the MB/FC concerns to expedite the process in order to conform to the requirements of law in this regard. However, with the passage of time, there would probably be more and more sophistication in the instruments of raising capital from the public. Already, a sea change seems to have taken place in this regard, as proved by the popularity of convertible debentures. Perhaps, the future demands of the capital market will encourage the MB divisions/FC concerns to devise more and more innovations for attracting and satisfying the investors. It will be good not only for the investing public, but also for the country, that MB/FC concerns provide healthy investment counselling, and persuade them to channelise the surplus funds for the benefit of country's economy. In this context, more consultancy services regarding portfolio management by MB/FC concerns, as recommended by the Banking Commission also, will go a long way to encourage the investors to participate in corporate finance more and more. The work of investment counselling could be very usefully organised for the benefit of lakhs of non-resident Indians too, to channelise their precious foreign exchange savings worth thousands of crores of rupees. There is also great scope for tapping the surplus financial resources of rural areas and divert them to the industrial activities of this country. This could easily be done by actively involving thousands of branches of banks in rural areas for distribution of application forms and prospectuses of companies, entering the capital market.

There seems to be a very good scope for the Indian companies to start joint ventures abroad, particularly in the developing countries. The MB/FC concerns can play a very useful role not only in preparing the project profiles for the joint ventures, but also in arranging rupee and foreign currency tie-ups for the client companies. There would be ever increasing demand for merchant banking services of the Indian banks and FC companies within the country too, in view of the expansion/renovation programme of the existing units, and also starting of new types of sophisticated industries in India. There is immense scope for corporate counselling also for mergers and amalgamation etc. However, it would be worthwhile to develop some sort of business code for MB concerns, and to strive for co-ordination amongst them from the present nascent stage of merchant bank-

No need for electoral reforms?

By ARVIND BHANDARI

RECENT parliamentary proceedings induce some thoughts. One of these is the puerileness of the convention that the opposition has to be opposed and that, therefore, any motion emanating from the other side of the House must be thrown out lock, stock and barrel irrespective of its intrinsic merit. Such a governmental posture indicates lack of self-assurance or just plain mindlessness. Can any observer of the Indian scene even for a moment disagree with the motion of Mr Madhu Dandavate about the urgent need for electoral reforms? But it was infra dig, for the Government to accept it, with the Law Minister, Mr Shiv Shankar, quibbling over the interpretation of "urgent" in an amazing display of casuistry. Anyhow, Mr Shankar did volunteer the exciting information that certain reforms were under consideration of the Government. Unless the powers that be actually move in the matter people have ceased to be impressed by such ritualistic utterances. Secondly, the Government has hardly strengthened its credentials by arming itself with more powers through the passage of the Essential Commodities (Special Provisions) Bill and the Prevention of Blackmarketing and Maintenance of Supplies of Essential Commodities (Amendment) Bill. If the Government has not had the political will to preventively detain blackmarketeers and hoarders, would it have the political will to bring them to speedy trial? Legislative over-activity cannot serve as a fig-leaf for politically motivated inaction. Moreover, the amendment that henceforth not judges but persons qualified to be judges can sit on the review boards raises doubts about whether the Government would resist the temptation to misuse the preventive detention measure. Mr Birendra Singh's performance in the Lok Sabha was symptomatic of the cynicism with which politicians try to extract political mileage even from the people's economic distress. Sugar, he said, would henceforth be available for Rs 6.50 a kg. But to dramatise his accomplishment he mentioned Rs 12 as the price ruling in various markets. The truth is that the price of sugar has seldom exceeded Rs 9, at least in north India.

Hamletian

The strategy to boost production, pompously called supply management, has remained almost a non-starter because what is needed is not piecemeal tinkering but a thorough revamping of the existing system of controls and taxation. Mr Venkataraman, therefore, nowadays talks of demand management and, like a latter-day Hamlet, is unable to decide whether to impound or not impound the dearness allowance of government employees. Impounding would serve little purpose. Any contractionary effect on aggregate demand would be neutralised by the Government's own growing non-development expenditure. And then the money will have to be repaid. A strong opinion in the national capital is that the first step on the demand management side should be economies in the Government's own unproductive expenditure. For instance, instead of impounding the dearness allowance of its employees the Government should prevent their number from rising. The army of government employees has increased from 10.3 million in 1972 to 15.3 million in 1980. The Central and state governments should freeze recruitment, fill new posts through transfers and allow the numbers employed to dwindle through superannuation.

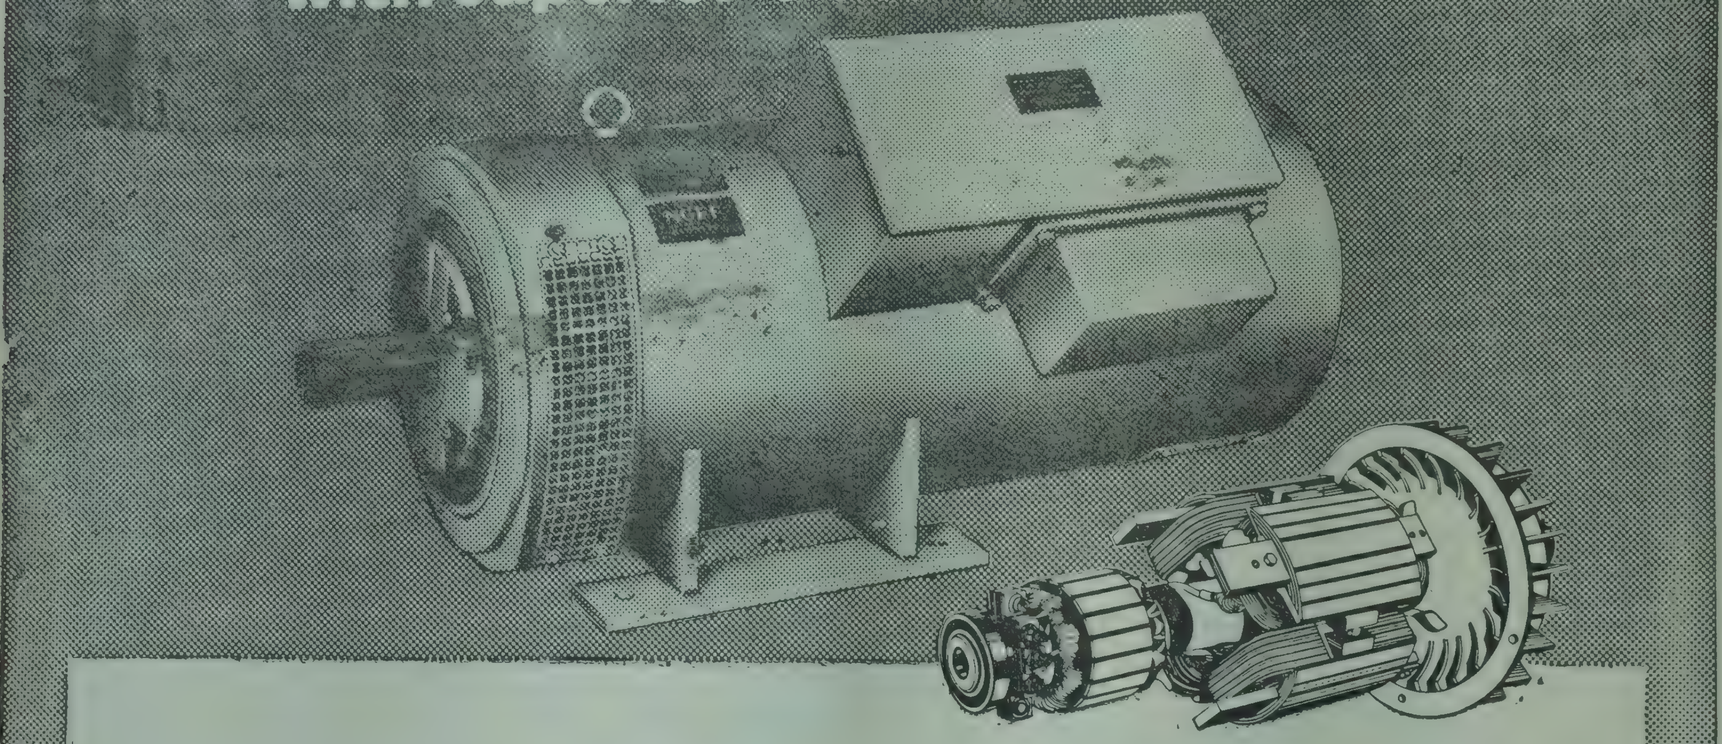
Over-secretive

The degree of official secrecy has a vital and yet insufficiently realised bearing on the quality of democracy. The Indian Law Institute has done a commendable study on the subject. Where the two conflicting rights, of secrecy and openness are concerned, it is always a question of finding the right balance. The value of the Indian Law Institute study lies in the fact that while it recognises the need for a balance between secrecy and openness, it points out the imperativeness of tilting the balance in favour of openness rather than secrecy, as is the case now. The vague rubric "public interest" cannot be a ground for secrecy. Definite guidelines must be drawn. Under Article 77 of the Constitution the President makes rules for the transaction of business by the Government of India, and for allocation of work among Ministers. The allocation rules, although made public till 1973, are now treated as confidential without any constitutional sanction. The Government's intention has been to cover up its own irregularities and defects rather than protect any public interest. Unlike the UK or the USA, in this country rules are framed in the secret chambers of the bureaucracy. Further, as is common knowledge, uncomfortable reports of various inquiry committees are never disclosed. In 1976 the Government directed its departments not to submit confidential files dealing with questions of policy to the Comptroller and Auditor-General. Ironically, even the recommendations of a study group on the Official Secrets Act are a secret. Section 5 of the Official Secrets Act, covering both espionage and the disclosure of official secrets, confers absolute power to prosecute those who impart information and those who receive it. Any information comes within the ambit of the Act so long it is a "secret", but the word "secret" has not been defined. To judge the impact of the Act from the number of reported cases of prosecution would be misleading. These cannot possibly reveal the frequency of the threats really used to prevent publication of unsavoury information or give an idea of the pervading fear among journalists of the Official Secrets Act.

DATELINE NEW DELHI

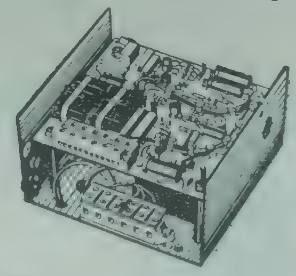
People's right to know has two aspects. First, the Government must not deter free flow of information. Secondly, it must make available to the people information not in the prohibited category. The ILI study has made sensible recommendations and recognised that the question of dissemination of information is a complex one. Defence, for example, has to figure in the list of secrecy, but certain aspects of it, such as defence factories and foreign purchases, when they involve mismanagement or corruption, cannot be treated as secret. After surveying the laws and practices in other parts of the world, the ILI has suggested that, broadly speaking, the following subjects be categorised as secret : defence or security of the nation, foreign relations, Cabinet proceedings and documents for they involve collective responsibility, information which is likely to be helpful to the commission of offences or impede detection of crime, private information supplied to the Government and information whose premature disclosure may enable the unscrupulous to make unfair financial gains. It is, however, recognised that even in these areas information may have to be disclosed in the public interest. Publication in the public interest should be statutorily recognised as permissible.

NGEF brings the latest proven, reliable technology of AEG-TELEFUNKEN in the widest range of Brushless Alternators — 8 kVA to 1150 kVA with superior Class 'F' insulation



Special highlights:

- **Less maintenance due to the absence of brushes, sliprings and commutators**
- **No failure of insulation or risk of fire hazards due to the absence of carbon dust**
- **Class 'F' insulation for all electrical parts — non-hygroscopic, preventing absorption of moisture**
- **Compact, sturdy electronic regulator common for all outputs that can withstand shocks up to 4 g on the Richter scale**



- **±0.5% voltage regulation at all loads**
- **Reference voltage adjustment up to ±5%**
- **Fast voltage build-up enabling better motor starting**
- **Fast transient response (No-load to Full-load — 200 to 600 milliseconds)**
- **Smaller size of base plate resulting from high output to weight ratio**
- **Ideally suited for parallel operation with the grid or other generators**

In the mid-sixties NGEF introduced, for the first time in India, the latest IEC frame sizes and class 'E' insulation instead of class 'A' insulation for AC electric motors. Over the years, this technology has proved itself, with other manufacturers following suit. Now NGEF does it again, introducing the widest range of Brushless Alternators with class 'F' insulation.

NGEF Alternators conform to IS: 4722, VDE 0530 and BS 2613. NGEF also offers special types suitable for marine duty as per the specifications of Lloyds, Indian Register of Shipping, American Bureau of Shipping and others, applications requiring constant voltage to frequency ratio and machines with sinusoidal wave forms, etc.

The normal radio interference up to grade 'G' as per VDE:0875 is provided, but NGEF can also offer as per grade 'N' or 'K' for special applications.

EASTERN INDIA TODAY

Ailing jute industry

By P. C. MAHANTI

THAT all is not well with the jute industry has been known for some time. But it appears to have escaped general notice that the current crisis phase has been of longer duration than any in recent past. It is not certain how and when the recovery will come. The industry employs a workforce of 2,500,000 men and affords indirect employment to millions of families through raw jute cultivation in eastern India, and livelihood of all these people dependent on jute will be jeopardised if the industry as a whole becomes sick.

If the attributes of sickness should be a whopping loss of Rs 10 crores a month as the Indian Jute Mills Association chairman has been saying for six months now, then the industry is sick already — or at least a kind of creeping sickness is enveloping it gradually. The workers of course are not convinced that the financial condition of the industry is as bad as the millowners have been saying it is. A spokesman of the Indian Jute Mills Association has just said that because of continuing losses of as serious an order as Rs 10 crores a month, the industry practically has eaten up its share capital, reserves and bank overdraft limit—in other words, it is now in a state of total bankruptcy.

The question is how long can an industry—an industry as large as jute—go on like this? At some point, there will be a breakdown and mill after mill will have to close. New Delhi is certainly aware of the crisis situation in the industry, but has chosen to remain silent on any move to restore the old subsidies on jute goods exports. The recession hit West, especially the United States of America, is unable to lift its normal requirement of jute goods and for some curious reason, the Soviet Union is not entering the market for hessian of which it is a large customer in a big way. At least Russian purchases could restore some confidence to the sagging gunny market. In the domestic market too, the Directorate General of Supplies and Disposals has not been buying in significant quantities and the cement industry, a large user of sacking bags, is recycling a lot of used or old bags into use.

While the industry is still struggling in a depressed market, the workers have begun taking to militant ways. On August 10 they went on a one day token strike. That was advance warning of regular industrial action later if, in the meantime, the industry did not concede their demand on revised grades and scales of pay or wages that a West Bengal Government Committee has recommended and subsequently accepted by the Labour Minister, Mr K. P. Ghosh. The strike threat is backed by all the 13 trade unions in the jute industry.

Meanwhile, the industry has sought the permission of the West Bengal Government not to be forced to pay the minimum bonus of 8-1/3 per cent on the ground of its serious financial condition. The exemption is unlikely to be granted, but the no bonus payment move is not likely to mollify the bitter feelings of the jute workers. But then if the industry is totally out of funds, as is says it is, how can it pay the statutory bonus unless the Government or the commercial banks come to its rescue?

Judging by the current level of market prices for jute goods and the increases in the support prices for raw jute, no mill can be earning a profit. It is quite credible that the industry is losing, on an average, Rs 1,200 on a tonne of jute goods produced. The cost of raw jute alone has gone considerably while the wages of the worker have been raised up by Rs 32 per month, not taking into account the substantial rise in the cost of petroleum products like batching oil, diesel oil and other inputs.

Individually, the loss on carpetbacking is placed at Rs 2.000 per tonne, on hessian at about Rs 1,300 per tonne and on sacking about Rs 800 a tonne. An average mill producing 2,000 tonnes per month is now said to be losing Rs 21 lakhs a month.

Here one comes back to the old question. How long can the industry carry on like this or what can be done to save it from disaster? As in every such case, two types of measures are needed — short term and long term. The short term steps obviously are to provide a measure of subsidy to exports to make it possible for the industry to offer its products at competitive prices. At the same time, the DGSD should place an immediate order for 100,000 tonnes of B-twills or sacking, linked to definite raw jute purchases against the order. Major consumers like the cement industry may be asked to use new bags only; and include jute goods in all immediate bilateral deals. This is what the industry has been asking for but New Delhi has been maintaining a studied silence. Dilydallying with a pressing matter like this is fraught with serious consequences. New Delhi should be aware of that.

The long-term ones lie in the direction of a total restructuring of the industry with appropriate measure of modernisation, diversification and, of course, rationalisation of the labour force. There have been plenty of recommendations on what long-term measures are needed, but a fresh study can still be ordered since the rapidly expanding domestic market shows that the jute industry in this country has a future.

Food production

Bihar, primarily an agricultural state in the country, is taking energetic measures to step up food production. The per capita availability of land in the State comes to 0.12 hectares only with the present population of 69.8 million, of whom 75 per cent live on land. Since the population is going on increasing while there is no scope to add to its present cultivated land area of 8.5 million hectares, intensive cultivation is most important. Equally important is the supply of inputs and use of the irrigation facilities created. The State produced 10.64 million tonnes of foodgrains last year and the current year's target is 11.6 million tonnes.

An expert has calculated Bihar's irrigation potential at 4.882 million hectares—2.452 million heactares from major and medium irrigation projects and 2.430 million hectares from minor irrigation schemes. But the current level of utilisation is only 3.52 million hectares, which leaves a gap of 1.362 million hectares between the potential and its use. Clearly, there is a lot to be done in the fields of land development and water management in the State. Incidentally, an official committee's finding that agricultural productivity in irrigated areas is not up to expectations is disturbing, and needs probing.

ONGC's plans

It is interesting to learn that the Oil and Natural Gas Commission entertains high hopes about the oil discovery prospects in eastern India. Mr P. T. Venugopal, the chairman, thinks the potential for oil discovery in the region, is quite large. He wants his organisation to do a lot of work in Nagaland particularly, and a large number of rigs have already been ordered for use is this State and other areas in the eastern region where the Commission is doing exploration work. In Assam itself, the ONGC hopes to raise output from three to four million tonnes annually.

BOOKS & IDEAS

Alarming growth in absenteeism

Management of Absenteeism

By S. K. BHATIA

Asian Publication Services, 243, *Defence Flyover Market, New Delhi* 110 024, *New Delhi* 1981 *Pages* : 1-237. *Price Rs* 60 *US $* 12.00.

Mr Bhatia is Personnel Manager of Bharat Heavy Electricals Limited, Bhopal, which has a large workforce. The present study is the result of the author's efforts in identifying and controlling the problems of absenteeism in a large industrial undertaking employing more than 10,000 employees and series of articles on the subject contributed by him in the management journals.

The subject matter of the book is, no doubt, a field, which has not been subjected to much analysis and is in fact a subject of interest to personnel managers who are interested in tackling the problems of absenteeism both in the legal and moral means.

The author has arranged the subject matter of this book in five sections, the first section introducing the subject of absenteeism and examining the causative factors, the second and third sections devoted to the case studies on the subject; section four offering solutions to the problem and the last section dealing with the role of various agencies in tackling absenteeism. There is an additional section of about 50 pages with appendices and bibliography.

Twentytwo million employees were working in the organised sector in India towards the end of 1978. On an average we are losing 20 million man days every year on account of strikes and lockouts alone. Apart from this, the author's analysis based on the data published by the Labour Bureau, Simla, and the Annual Survey of Industries (ASI), shows that the yearly rate of absenteeism has gone up from 7 per cent in 1957-58 to around 20 per cent in the recent years and the author finds the situation quite alarming. The rate of absenteeism is the highest in April, May and June — the obvious causes being "pull of the land", closure of educational institutions, marriages, harvest season etc.

The absenteeism is notably high in certain industries like plantations, in mica mines etc. Compared to Western Europe, our absenteeism in general is very high. We have yet to establish industrial consciousness among workers. In analysing the causes contributing to absenteeism, the author is of the view, that the study of the organisational factors at plant level can be more fruitful in taking remedial steps by the management and the external factors (socio-cultural) are generally outside the control wholly or largely of the individual industrial organisation. Nevertheless these external factors like inadequate housing facilities, insufficient transportation facilities, lack of recreational facilities, conditions in the labour market which lead to 'job-shopping', and holidays pattern *etc* contribute to absenteeism which should be a matter of concern to anyone who is interested in 'cost reduction' on account of absenteeism.

The second section of the book is useful to the plant level managers in helping them to analyse the causative factors of absenteeism. The findings of the author are worth reproducing here:—

"(a) *Rules & Procedure* :

There is a healthy down-ward trend in absence rate in the plant but the pattern is unplanned, unauthorised and of short duration leave due to misuse of privilege extended by the management regarding non-production of medical certificate for less than two days sick leave. This causes large number of spells of 1 or 2 days duration.

- Absenteeism is more after pay days and weekly off days.
- Advance crediting of leave during peak production period of 25th December year affects absenteeism.
- Accumulation limit of sick leave is less and encourages employees to avail.
- Few private medical practitioners are contributing to absenteeism.
- Inadequate check in sanctioning of leave.

(b) *Core group of habitual absentees* :

- Existence of a core group of habitual absentees.
- Beside this, a large number of employees are exceeding the eligibility limit of leave.

(c) *Factors/causes identified in survey analysis :*

- Indebtedness.
- Ill-health.
- Lack of awareness among habitual absentees of having taken more leave.
- Frequent visits to home town.
- Personal factors (in contrast to organisational factors) have more significant relationship with absenteeism.
- Survey analysis clears some common myths and beliefs existing in the plant that absenteeism is due to —
  (a) Non-provision of quarters by the company.
  (b) Non-provision of bus facilities by the company.
  (c) Company have large number of dependents to support.
  (d) Welders are "more habitual absentees,"

Remedial measures, are easy when an analysis is made on scientific lines.

Personal factors — individual *per se* — play a major role in absenteeism. Some of the findings of the author under personal factors are quite revealing :— 1. The chronics (habitual absentees) are more in the higher age bracket and higher experience group who find a justification in seeking relaxation for having done so much for the organisation and also a sense of oversecurity developed over year. 2. The chronics are miners in the higher grades and service in the grade. 3. Chronic absentees have taken large amount of loans ranging from Rs 5,000 and above and average groups below this amount. 4. Chronic absentees are more on the literate group. 5. They are more in the married class. 6. The chronics live far away from the factory. 7 Frequency of visits to home town. 8. Chronics are in those groups of people who borrow money for the day to day expenses. 9. Those sending money home are not chronics—they are more responsible.

The author's findings as regards policies relating welfare measures and absenteeism that it may be more meaningful to help employees secure their own mode of transport by extending loans than to expand the fleet of company transport and it will be more prudent to help employees build their own houses by providing loans than constructing additional houses which goes to lock up capital and add up to other associated problems should provoke the managements to take such policy decisions.

The contribution made by the organisation in improving the lot will bring better results when individuals also play their role. It is the integration of the contribution of both the individuals and organisation, which help in tackling the problem of absenteeism both at micro and macro levels. The habitual absentees are to be dealt with when once they are identified in an imaginative way. While managers often grumble about their absenteeism problem, they do not necessarily do anything about it.

The section on cures for absenteeism lays emphasis on (1) the supervisor who has to "humanise" the job and create interest and co-operation in the organisation. 2. Care in selection and placement. 3. Preventive health programme. 4. Reduction in working week and flexi-time. 5. Attendance bonus schemes. 6. To recognise the fact that leave is important for health. 7. To see that the cure of absenteeism does not create in its wake more labour turnover *etc* which again is a costly factor. 8. Habitual absence should be tackled as a case of indiscipline.

In the fifth section, the author identifies the following agencies to be involved in tackling absenteeism :

1. Supervisor, 2. Individual, 3. Union, 4. Shop Council, 5. Training Department, 6. Technology and Industrial Engineering, 7. Top Management, 8. Departmental Head, 9. Medical Department, 10. Accounts Department and 11. Personnel Department.

The role of counselling in controlling chronic absenteeism has according to the author, improved 75 per cent of the absenteeism. Counselling should be preceded by understanding the person concerned. The counseller has to listen to the problems and he should not give his evaluative judgement at once which can be a barrier in meaningful communication.

The author has highlighted the role of counselling in reducing absenteeism in a significant manner. On the whole, Mr Bhatia, has made a sincere attempt in analysing the problems of absenteeism and methodologies to be adopted in identifying the problems and the possible preventive measures, and covers a hitherto comparatively unexplored area.

This book would be particularly useful to all those who are concerned with 'personnel management' in units big or small. The author's research study based on one of the large public sector units in India, should be a guide to other public sector units in evaluating their own experiences and to find ways and means in effecting economies in cost — an element which is very important in determining the profitability of public sector enterprises in India.

N. Hariharan

Substitute for paraffin

AN article in *Ceres*, published by the Food and Agricultural Organisation, suggests that sugarcane offers renewable source for producting industrial wax.

The article says: "With the gradual depletion of the world's fossil fuel reserves, many often overlooked by-products of the petroleum industry are likely to be threatened as much as motor fuels. Among these are paraffin wax and micro-crystalline wax, both widely used for various industrial purposes.

"In the search for a suitable substitute available from renewable resources, scientists are turning their attention to sugarcane wax as a substance showing considerable promise. Sugarcane is grown abundantly in most tropical countries. Thin layers of wax are present on the rind, particularly at the internodes. The amount of wax available on any plant depends on a number of factors, such as the variety being grown and agro-climatic conditions, but it it estimated that on average it forms about 0.12 per cent of the weight of the cane.

"However, when sugarcane is crushed in conventional sugar milling plants, more than 50 per cent of the wax contained on the rind finds its way into bagasse which is subsequently burned in the boilers as fuel. The remaining portion of the wax finds its way into the sugarcane juice. Since the wax is insoluble, it precipitates, accumulating in the filter cake where it may comprise from four up to 20 per cent of the total weight of the cake.

"In India, one sugar milling plant is now producing about 150 kg of crude wax per day, which is being used, in some cases after refining, in the manufacture of carbon and stencil papers and in various types of polishes. The working of the plant was described recently before the International Society of Sugarcane Technologists by P. J. Manohar Rao, Additional Chief Director in India's Ministry of Agriculture and Irrigation. Cane wax is extracted by following a solvent extraction process using mineral turpentine as the solvent for extracting crude wax and isopropyl alcohol as the solvent for refining crude wax. However, declares Rao, further research and development are necessary to improve the quality of the cane wax."

Gold and silver price maze

Concluded from page 419

this time the Bombay price surging ahead of the London price. This position has continued till July 1981.

Besides, the relative price difference in case of gold between the two markets has also gone up of late. During 1980, the London price had been higher on an average by 7.4 per cent. But in the first seven months of 1981, the Bombay price has become higher by an average of 21.8 per cent. In fact, in 1981, the relative difference has increased fairly steadily and was nearly 30 per cent in July 1981, and was the highest in the last 19 months beginning with January 1980.

In view of the higher prices of gold in the Bombay market than in the markets abroad, a good amount of gold is reportedly being smuggled into India. According to some reports, more than 5,000 tolas of gold is being smuggled into India every day from Dubai. According to these reports, gold is being bought in London and Zurich and then smuggled into India *via* Pakistan.

One can of course wonder whether the smuggling of gold and silver remains profitable in the changed situation of their relative prices. By and large gold is smuggled into India and, in return, silver is smuggled out. With the price difference of silver coming down heavily, one would have imagined margins in the smuggling of gold and silver might not be worth the risk involved in such activities. But the calculation of those engaged in this illicit inflow and outflow are somewhat different.

Emergence of financial managers

Concluded from page 424

ing, so that this business is developed on healthy lines, contributing to the ultimate good of the nation.

The idea of forming a Merchant Bankers' Association on the lines of Indian Banks Association may be worth pursuing to provide a forum for fruitful discussions. Better attention to the training programme to meet the personnel requirements of the MB divisions of the banks and FC companies will also go a long way to develop merchant banking on sound lines. The State Bank of India, being the premier commercial bank of the country, could play a key role in organising a well-planned training programme in merchant banking on scientific lines.

WORLD FOOD DAY

Development Oriented Coins 1981

ON SALE FROM 25TH AUGUST TO 24TH SEPTEMBER 1981

100 Rupees
50% Silver
44 mm. 35 gm.

Obverse

10 Rupees
Cupro Nickel
39 mm. 25 gm.

UNCIRCULATED COINS :
Two-coin set, consisting of one 100 Rupee and one 10 Rupee coin at Rs. 135 per set. Single 100 Rupee coin at Rs. 120 and single 10 Rupee coin at Rs. 15. Packing and Forwarding charges extra, at Rs. 10 upto four coins or two sets and Rs 15 from five to ten coins or three to five sets.

SALE TERMS :
Full advance payment including packing and forwarding charges to be made at the Mint Counter OR by Postal Order/Money Order/Demand Draft on Bombay Branch of any Bank in favour of the 'General Manager, India Government Mint, Bombay' so as to reach him on or before 24th September 1981. Remittance received after this date will not be accepted.

BOOKING LIMIT :
Not more than 5 sets per individual coin collector will be issued. Organisation of repute may place bulk orders.

DELIVERY :
From 16th October 1981 onwards (3 P.M. to 4 P.M.) on all Mint working days, subject to availability of sets.

BOOKING TIME :
10.30 A.M. to 12.30 P.M. on all Mint working days during the above mentioned period.

EXPORTS :
Mint is also permitted to export these coins. Orders for export should be placed directly on the Mint against advance payment in foreign exchange.

1. All transactions subject to Bombay Jurisdiction.
2. Order once accepted cannot be cancelled under any circumstances.
3. The Mint reserves the right not to accept an order either in whole or in part.
4. The Mint also reserves the right to stop the booking at any time without notice, depending upon the production capacity and abnormal rise in the price of silver.
5. The purchase of above coins/sets will not bestow permission for export thereof, which is regulated by special orders issued from time to time.

INDIA GOVERNMENT MINT, BOMBAY

Household savings

Sir,—Dr Vasudevan's article on Estimating the Household Sector Savings in Currency and Deposits (*Commerce*, August 1, 1981) is quite interesting and topical. It raises certain methodological issues in the estimation of savings in the form of currency and deposits. His apprehension that the data on currency and deposits savings are essentially statistical derivations and the behavioural elements in the propensities to save in currency and deposits are not present, is quite debatable. It is empirically well demonstrated in many studies (notably Dr Mujumdar, Venkatachalam and Raghavachari's study in RBI occasional papers, June 1980) that the national income is one of the most significant factors influencing the currency with the public, demand deposits and time deposits, of commercial banks. It is too simplistic to say, that there is high correlation between household savings in currency and deposits with incremental currency with the public and deposits. The study cited above found that income elasticity of currency to be 0.82, demand deposits 1.32 and time deposits 1.45. So our opinion is that the present estimation of the household savings in currency and deposits is not void of behavioural elements.

Regarding the test of hypothesis *i.e.* the demand for transaction balances is positively correlated with the nominal income or output and prices, it may be pointed out that some estimates between variables that is outstanding currency and deposits of the household sector of *t*-1 period and the nominal income at *t* period, should be attempted.

It may be further added that Dr Vasudevan's suggested estimation of the household sector savings in currency and deposits, in order to derive speculative demand for cash balances should attempt to relate the income velocity of currency of the households with an average price of some sensitive commodities including gold, silver and industrial securities, instead of with short-term rate of interest for more meaningful results.

Dr Vasudevan has pointed out that in respect of currency and deposits, increases between March 31 of a year and March 31 of the subsequent year, will contain 'shock effects'. He has suggested that averages of outstandings of currency and deposits at the end of each month for the years concerned should be worked out to know the 'flow' of these variables. The utility of Dr Vasudevan's article would have been enhanced had he worked such averages for a few years and compared with the outstandings between preceding March 31 and succeeding March 31 of those years. This would have given some idea to of the extent of divergence.

Dr Tapose Coomer
Bombay

Industrial sickness

Sir—The report by the Reserve Bank on *Currency and Finance* 1980, reveals that well over 50 per cent (out of 21,000) sick units are in the most advanced industrial states of West Bengal and Maharashtra, the major reason being labour millitancy and unions' destructive attitude. Further, the number of legislations enacted by these labour welfare states, such as Minimum Wages Act and other benefits are such as to practically kill the goose that lays golden eggs. Further the Government "the champion of SSI units" demands in advance, even when sales are made on credit, payment of excise, sales tax, ESI, PF and other dues including raw material and fuel costs, while there is no remedy to recover their blocked funds in various outstandings with government and private sectors.

Tatya Tendulkar
Kolhapur

Environmental pollution

Sir,—The haphazard growth of industrialisation particularly in the metropolitan and large cities like Ahmedabad, Bombay, Calcutta, Kanpur etc, has witnessed the spread of lung cancer, tuberculosis, bronchitis, blindness, asthma etc. Such a health hazard is a serious threat due to the alarming rise of environmental pollution. The alarming magnitude of environmental pollution has greatly been responsible for the deteriorating quality of life in metropolitan cities. The air pollutants are carbon dioxide, carbon monoxide, sulphur dioxide, nitrogen oxide, hydrochloric acid, etc, which are a health hazards.

There is an imperative need for checking the alarming magnitude of industrial smoke in metropolitan and large cities. It should be pointed out emphatically that the industrial growth in cities has to be restricted and the industrial licensing policy should emphasise decentralisation of industries. The low chimneys of power stations and industrial units be raised so that the smoke does not spread in the residential neighbourhood complex.

The garbage problem particularly in Ahmedabad, Bombay, Calcutta, Delhi and Kanpur is assuming alarming proportions of collection and disposal. There is scope for research and development in recycling waste.

To a large extent industrial waste results in polluted rivers and seas. Water pollution is a serious menace to marine life and human population. Surprisingly, the penalty now imposed by municipal corporations for dumping untreated industrial waste is negligible. There is need to impose a heavy penalty and even life imprisonment for such offence as it also results in spreading of waterborne diseases particularly in metropolitan and large cities.

Surprisingly, forests have been ruthlessly destroyed giving rise to frequent occurrence of floods. In the name of urban development even rural areas are being steadily encroached upon, the consequences of which would be serious ecological imbalance, further marring human existence.

Gopal Bhargava
New Delhi

Photopolymer system

Sir—We refer to Table 2 in the article "Liquid photopolymer system" (*Commerce*, March 12, 1981) and wish to point out that besides the solid photopolymer plates, BASF also have nyloprint liquid systems for newspaper printing. Matter of fact, BASF offers the largest choice of photopolymer plates for newspaper printing, consisting of: (1) Nyloprint WD plates: water washable solid relief plates; (2) nyloprint WM plates: water washable pattern plates; (3) nyloprint LD plates: water washable liquid relief plates; (4) nyloprint LM plates: water washable liquid pattern plates; (5) nyloprint RD plates: alcohol washable sold relief plates; and (6) nyloprint RM plates: alcohol washable solid pattern plates.

The range of photopolymer plates extends further to conventional nyloprint plates meant for commercial printing, nyloflex meant for flexo printing and nylotron LN photoresist films for printed circuits (PTH).

Special Reports

Relief for tea industry?

From P. C. MAHANTI

CALCUTTA

IN the first week of August, there was a "national tea meet" in which the tea industry, the Commerce Ministry of the Government of India and state governments concerned took part. The meeting was called at the instance of the Commerce Ministry to consider the developing crisis in the tea industry and what reliefs are called for to mitigate the hardship that the gardens both in the north and south are going through. The meeting lasted two days and at the end of it, there was a general consensus on the following points :

(1) Excise duty on tea should be substantially reduced; indirect taxes paid on exports should be refunded through a simple drawback procedure; excise duty on packet tea should be substantially reduced or totally removed; sales tax on auctioned tea should be substantially cut.

(2) Agricultural income tax and other local government taxes should be adequately cut, if not suspended altogether. Since tea is being taxed as an agricultural operation by the State Governments concerned, the industry should also be treated like agriculture for bank credit purposes; in other words, the tea industry should be granted credit at concessional rates of interest.

(3) Considering the financial plight of the industry, the existing procedure in regard to the advance payment of income tax should be suitably amended to provide reasonable relief.

(4) The West Bengal rural employment cess should be waived on all export sales of tea; producers using their tea for packeting purposes should also be exempted and tea being used for production in value-added form should not be compulsorily required to go through auctions. The West Bengal Government should decide early on a representation of the industry that it must be given freedom to choose its own channel of marketing and total exemption from the cess. These reliefs have been recommended for a period of three years.

The deliberations at the meeting were preceded by a very forthright speech by Mr P. K. Kaul, the then secretary to Commerce Ministry, who expressed full sympathy with the tea producers and at the same time gave a graphic picture of how costs have been overrunning prices. The Commerce Minister also agreed with his secretary and then cheered up the industry, and encouraged the belief that government action on the agreed recommendations will soon follow. Auctioneers in London also were led to believe that some fiscal relief would be forthcoming in the near future and they instructed their agents in Calcutta not to ship tea until the relevant official decision was known. This has necessarily led to a sharp decline in tea shipments from Calcutta port as well as from the country as a whole. The Tea Board, it is understood, has not received a single application for tea export licence during the past two weeks.

Messrs V. P. Maithel and S. K. Mehera, chairman and vice-chairman, respectively, of the Indian Tea Association who briefed the press on the crisis situation in the tea industry leading to the stalling of exports, stressed the point that this development was not conducive to the fulfilment of the export target in 1981-82 which has been fixed at 230 million kilograms. As it is, there is an oversupply of tea in world market, and the various imposts coupled with the inexorable cost pressures are making the Indian tea more and more uncompetitive.

The chances of international agreement among the various tea producing nations on fixing a global quota for tea export are no brighter than it ever was. The opposition of new African producers, especially Kenya, to the prescribed quota system has been frustrating negotiations at various levels organised by UNCTAD and GATT.

While the outlook for exports thus remains uncertain, the domestic market has been developing an unexpected turn. The growth rate in the consumption rate has not only slowed down, but was actually negative during the past year. The high price of sugar and its relative scarcity were largely responsible for the decline in home consumption of tea. There was yet another factor which was sociological — the younger generation seems to prefer cold or soft drink to a hot beverage like coffee or tea. The tea producers are naturally worried about the trend, and propose to hold an internal market survey to find out what can be done to revive the tea drinking habit among the younger people in the country.

The greater worry is the falling trend in tea auction prices. Between January-June last year and the same months in 1981 there was a sharp fall. Between 1976 and today there is of course some increase in price, but if one takes into account the very high rate of inflation in the Indian economy, the tea auction price today is significantly lower in real terms.

CORPORATE SECTOR

A marked improvement in financial performance

BOMBAY

THE latest study on the financial performance of the portfolio of public limited companies assisted by the Industrial Credit and Investment Corporation of India Ltd (ICICI) indicates an all-round improvement in the performance of the corporate sector as a whole during 1979-80. Sales during the year under review increased by 15.4 per cent, the respective increases in gross profits (profits before interest and depreciation provision and taxation) and operating profits or profits before tax (gross profits minus interest and depreciation) being 17.4 per cent and 19.4 per cent. As a sequel to improved sales, profits after tax increased considerably enabling the private corporate sector to augment its ploughed back profits, reflected in a 35.5 per cent rise in retained profits, besides enabling a number of companies to pay higher dividends. The industry groups mainly responsible for this improved overall performance were electrical equipment, tyres and tubes, paper and paper products and textiles. There was a mild turnaround in the profitability of shipping. On the other hand, an important industry whose performance deteriorated during the year was cement. The study also revealed that there was a decline in capacity utilisation in the case of many industries.

On the basis of corporate results available at the time of the preparation of the study, the ICICI has predicted that the corporate sector's operations would continue to be generally satisfactory during 1980-81.

The ICICI study covered 417 companies for the five-year period 1975-76 to 1979-80. The companies in the sample with a total paid-up capital of Rs 1,483 crores in 1979-80 accounted for 53.9 per cent of the paid-up capital of non-government public limited companies at work as at the end of March 1980.

The net sales of the 417 companies registered an increase of 15.4 per cent from Rs 10,137.3 crores in 1978-79 to Rs 11,695.9 crores in 1979-80, as against the annual growth rates of 11.5 per cent in 1978-79, 8.6 per cent in 1977-78 and 12 per cent 1976-77. Most of the industry groups (except textile machinery, cigarettes and woollen textiles wherein the net sales declined) showed increases in sales during 1979-80 over those in 1978-79. Some of the largest rises were recorded by sugar (29 per cent), followed by ferrous metal products (26.5 per cent) and electrical equipment (18.7 per cent). However, cement (1.5 per cent) and shipping (1.1 per cent) registered only a marginal increase in sales.

The total income of the sample companies increased by 15.3 per cent in 1979-80 as against 12.4 per cent in the previous year. The total expenses recorded an increase of 15 per cent to Rs 10,577.4 crores in 1979-80 from Rs 9,199.1 crores in 1978-79 against the increases of 12.1 per cent, 9.1 per cent and 10.6 per cent respectively in the three preceding years. More than half (55.8 per cent) of the rise in total costs in 1979-80 was accounted for by the expenditure on raw materials consumed which increased by 14.2 per cent (10.9 per cent) over their previous years' level, while salaries and wages increased by 12.6 per cent (12.2 per cent). It is interesting to note that expenditure on power and fuel by the sample companies rose by 14.9 per cent in 1979-80 (over that in 1978-79) over and above the rise of 18.2 per cent in 1978-79 (over that in 1977-78).

Profitability and profit allocations

Gross profits, profits after tax and retained profits recorded significant rises during 1979-80 over the previous year's levels. Gross profits of the 417 sample companies increased by Rs 238 crores or 17.4 per cent to Rs 1,609.3 crores in 1979-80 as compared to the increases of 14.4 per cent, 6.7 per cent and 5.4 per cent respectively in the three preceding years. There was a rise of 19.4 per cent (23.3 per cent) in profits before tax or operating profits in 1979-80. Profits after tax or disposable profits increased considerably by Rs 90 crores (23.8 per cent) from Rs 378 crores in 1978-79 to Rs 468 crores in 1979-80. Consequently, the rate of growth in profits after tax as per cent of net worth was higher at 14.1 per cent in 1979-80 as against 12.6 per cent in the previous year.

The appreciable rise in disposable profits enhanced the dividend paying capacity of the corporate sector. Dividends paid increased steadily from Rs 123.5 crores in 1975-76 to Rs 189.4 crores in 1979-80. The payout ratio as

Exercise book .. .. (200 pages)	—	2.50	2.50	2.50	—	—	—	—

total profits after tax was 40.5 per cent in 1979-80 against 50 per cent during 1975-76 to 1977-78 and 45.7 per cent in 1978-79. Retained profits or profits ploughed back in the companies rose significantly by Rs 73 crores from Rs 205 crores in 1978-79 to Rs 278 crores in 1979-80.

Profit margins

Profit margins represented by gross profits as percentage of sales which had declined from 14.4 per cent in 1974-75 to 13.1 per cent in 1977-78 rose to 13.5 per cent in 1978-79 and again to 13.7 per cent in 1979-80. Although the falling trend in the return on capital employed and operating profit ratios noticed during 1974-75 to 1976-77 showed an upward movement in 1977-78 and also in 1978-79, these ratios during 1979-80 were well below their levels in 1974-75. Operating profits as percentage of sales in 1979-80 marginally increased to 7.2 per cent from 6.9 per cent in the previous year. Although the operating profit to sales ratio went up in 1979-80, the increase in profitability was insufficient to cover the increase in financial requirements of capital formation. During 1979-80, industry groups such as pulp, paper and paper products, automobiles and cycles, and glass and pottery exhibited gross profits to sales ratios which were higher than that for the total sample.

Return on capital employed represented by profit before tax plus interest as per cent of capital employed (*i.e.* net worth and all borrowings) was a little higher at 19.7 per cent in 1979-80 as against 18.9 per cent and 17.9 per cent respectively in the preceding two years. The companies with return on capital employed of 20 per cent or more increased from 179 in 1978-79 to 206 in 1979-80. On the other hand, the number of companies with negative rates of return on capital employed, which had increased from 39 in 1975-76 to 46 in 1977-78 declined to 31 in 1979-80. During 1979-80, industry groups such as electrical equipment and glass and pottery showed substantially higher than the average return on capital employed for the sample as a whole (19.7 per cent).

Gross capital formation and financing

Total assets (gross fixed assets, inventories and other current assets) of the sample companies increased by Rs 1,759 crores (Rs 1,135 crores) in 1979-80. The rate of increase in gross capital formation accelerated continuously from 6.2 per cent in 1976-77 to 11.9 per cent in 1978-79 and further to 15.3 per cent in 1979-80. The rate of growth in gross fixed assets also registered a substantial rise at 11.4 per cent in 1979-80 against 10.8 per cent in 1978-79. In absolute terms, the increase in gross fixed assets

---

As I see it

Dandakaranya Development Project

A report from Bhubaneshwar published by the *Business Standard* of Calcutta on August 6 states that the Union Government has finally decided to implement its decision to wind up the Dandakaranya Development Authority (DDA), which had been set up in 1958 to rehabilitate the refugees coming from the then East Pakistan (now Bangladesh) in the wake of the partition of India. Apparently the Government is of the view that the objectives for which the DDA had been set up have been duly implemented. That was the gist of a statement made by the Minister of State for Supply and Rehabilitation in the Lok Sabha on May 5, 1981.

Against the Minister's assertion about the completion of the project, one has to consider the fact that barely six months earlier, in December 1980, the Estimates Committee (1980-81) of the Seventh Lok Sabha, in its second report, did not see the possibility of an early completion of the project. It emphatically stated, "The Committee do not agree with the view of the Government that at this stage a further review of the DDA is not necessary. As already pointed, there has been failure on the part of the DDA to arrange a satisfactory resettlement of displaced persons in Dandakaranya even after a lapse of a long period. The Committee feel that even at this stage it is necessary to have an independent review of the working of the DDA in order to strengthen it to be able to fulfil speedily the object for which it was set up". At the end of December 1979 the Ministry of Supply and Rehabilitation expressed the hope that it would be possible for the project authorities to complete the task of rehabilitation of the remaining families "within the next 2 to 3 years". The statement that the project has been completed thus comes as a surprise.

Up to 1979, at an expenditure of Rs 100 crores the Dandakaranya project settled 19,647 families (about one lakh persons), established 386 villages, reclaimed 1,66,660 acres of land for homstead, agriculture and various other purposes, established 296 primary, 31 middle and eight higher secondary schools, 17 medical institutions (five hospitals, five primary health centres, four mobile units and three dispensaries), constructed 308 village tanks, 347 head-water tanks, 483 masonry wells and 1,750 tubewells, 561.40 km of main roads, 821.75 km of link roads, 405.38 km of internal roads and 295.40 km of tribal roads, and executed irrigation projects wtih a command area of a little over two lakh acres.

In December 1980 the Estimates Committee reported lack of progress in the distribution of *pattas* to the settlers in the Umerkote Zone and it expressed the view that "the matter is not being dealt with a sense of urgency that it deserves". Electrification of the villages in the resettlement area, although considered an essential element for the development of the area, was not done, despite an earlier recommendation of the Committee, asking the DDA to draw up a time-bound programme for electrification. Out of 227 villages in Orissa and 154 villages in Madhya Pradesh only eight villages had been electrified by December 1980. Further the Potteru irrigation project, which was originally scheduled to be completed by 1978-79, is not expected to be completed before 1982.

The settlers are exposed to the scourge of forcible cutting of their crops and encroachment upon their land by the tribals. A voluntary organisation, Tagore Society, under the initiative of Mr Pannalal Dasgupta has started working in the area to promote understanding and cooperation between the tribals and the settlers, according to the statement of the Ministry. It is to be hoped that the two state governments of Orissa and Madhya Pradesh would also support activities toward this end of amity between the settlers and the tribals.

Money

Project monitoring by financial institutions

TERM lending financial institutions take great risks as development institutions. They try to share the rosy prospects of the enterprise along with the promoter entrepreneurs They have their basic norms that cover four major areas. Promoters' equity and debt-equity ratio, and margin on the value of the assets and the capacity to service the debt. The hopeful entrepreneurs struggle to convince the financial institutions that they actually satisfy and will continue to satisfy these norms. The institutions apply very strict standards in assessing the prospects for the enterprise in order to ensure that the strict norms will help them weed out risky and half-baked projects from the potentially viable ones.

In making these assessments, the assessing teams consisting of financial, technical and economic experts make several assumptions regarding the meaning, significance, consequences and implications of the sanction which they may give. In other words, the appraisal wings of the sanctioning authorities draw up in their own minds, and perhaps on paper too, an implementation schedule or a critical path for the completion of the project they sanction.

These assumptions and implications are very useful tools and significant means in regulating the growth of the project and ensuring its completion. Anyone who follows up the project, surveys its progress and wants to assess its implementation can do so very effectively with the help of these tools and means. They serve as reference guides and markers in the uncharted course of project implementation.

But in practice no one makes any use of these tools. They remain with the appraisal wings of financial institutions while the follow-up, inspection, disbursement and monitoring are passed on to the other wings of the lending agency. Often they are very competent people, but they lack the background that the appraising wing has when it sanctioned the project.

In the circumstances, the task of monitoring project implementation of enterprises financed by the leading development banks becomes either mechanical or meaningless. Their objective degenerates into a mere verification of assets created and satisfaction of having a physical security to support the loan.

Project monitoring quality can improve and lead to better results if the people responsible are provided with better means and more effective tools, better and more effective guidelines and a new perspective. This means several new things. First, every time an appraisal is completed, the appraising officers should record the assumptions on which they have cleared the project and the implications of sanction they have in mind. Second, at the time of sanction, usually it is the financial institution officials who prepare the implementation schedule and very often the borrower has no say or relevance. It would give much better results if the borrower is requested to sit with the appraising team at the time of sanction and the implementation schedule is extracted out of the borrower's own mind. This interview would be very helpful in telling the financial institutions whether the borrower has done his homework adequately and is ready to implement the project or not. Thirdly, the entire perspective of project monitoring has to be changed from policing inspection at the worst to technical assessment at the best. Monitoring is a total financial assessment of the progress made so far. An evaluation of the relationship between assets and liabilities, between production and income earning potential. What is required is not a chartered accountant's certificate of assets being created and charged, or of his having brought in his capital, but the analysis of the complete balance sheet every quarter or every alternative month to understand the implications of the progress.

S. G. Shah

in 1979-80 at Rs 731 crores accounted for 41.6 per cent, a major portion of the rise in gross capital formation The plant and machinery component which accounted for 69 per cent of the increase in gross fixed assets in 1979-80, witnessed a rise of 10.8 per cent. Inventory accumulation in 1979-80 amounted to Rs 666 crores as against Rs 346 crores in 1978-79 and Rs 104 crores in 1977-78. This was mainly responsible for the substantial increase in gross capital formation in 1979-80. The ratio of inventory to sales rose from 26.3 per cent in 1978-79 to 29.1 per cent 1979-80. The bank borrowings as per cent of inventories declined steadily from 55.1 per cent in 1976-77 to 45.7 per cent in 1979-80 reflecting lower dependence on bank credit for inventory build-up probably as a result of the tightening of bank credit to the organised industry.

As much as Rs 575 crores or 32.7 per cent of the gross capital formation was financed from internal sources comprising depreciation provision and reserves and surplus, with depreciation provision alone accounting for Rs 324 crores or 18.4 per cent of the total funds obtained. The share of reserves and surplus in the total sources which had declined from 12.8 per cent in 1975-76 to 3.2 per cent in 1976-77, witnessed a reversal of trend by a rise of 9.2 per cent in 1977-78. This share almost doubled to 17.2 per cent in 1978-79, but dropped to 14.3 per cent in 1979-80. Reserves and surplus increased by Rs 324 crores in 1979-80 over and above that of Rs 294 crores in 1978-79 thereby reflecting improved profitability and enhanced plough back in the sample companies. Despite the increase in reserves and surplus, equity-debt ratio declined from 72:28 in 1978-79 to 70:30 in 1979-80.

STANDARD ALKALI

Products on tap from Standard Alkali—Hydrochloric Acid, Caustic Soda, Caustic Potash, Potassium Carbonate, Chlorine, Carbon Tetrachloride and Chloroform.

For over a decade, Standard Alkali's products have been known for their superior quality and competitive prices.

Our customer list includes just about every important name in the industry today.

Coming to think of it, Standard Alkali has become synonymous with dependability.

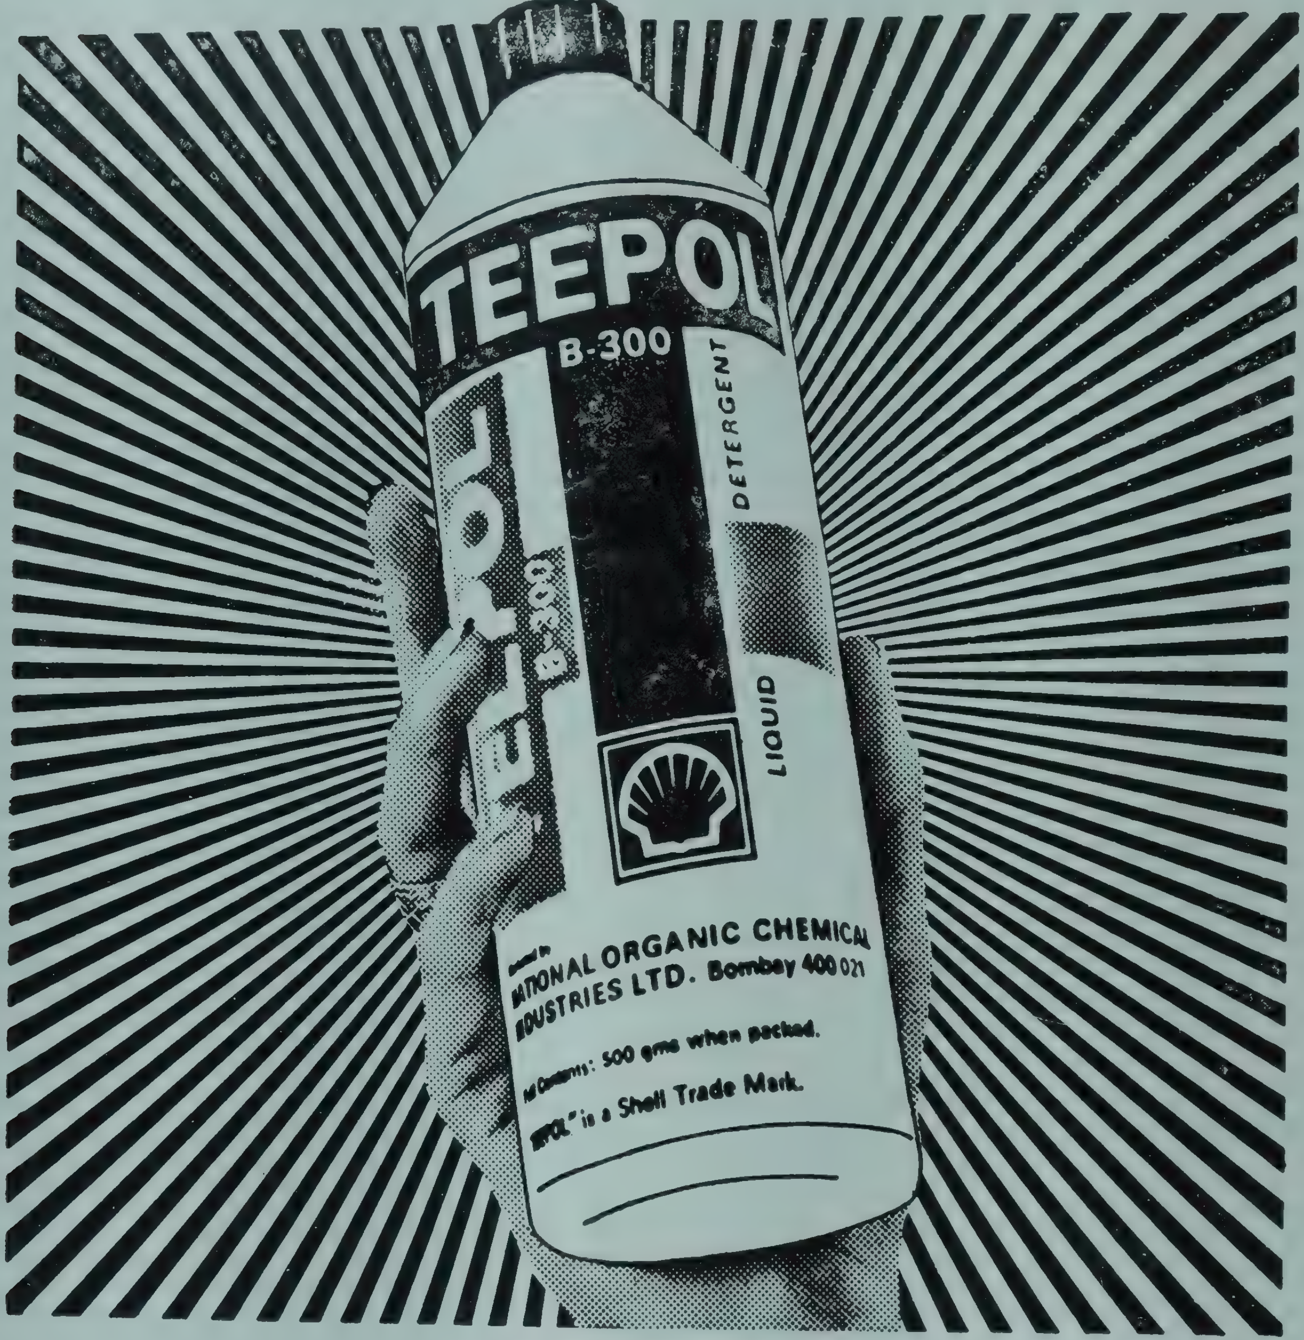
Housewives!

Here's the answer to all your cleaning problems



TEEPOL
B-300
TEEPOL
B-300
DETERGENT
LIQUID
NATIONAL ORGANIC CHEMICAL INDUSTRIES LTD. Bombay 400 021
Net Contents: 500 gms when packed.
"TEEPOL" is a Shell Trade Mark.

TEEPOL

multi-purpose liquid detergent

TEEPOL—a world-class product used by women the world over

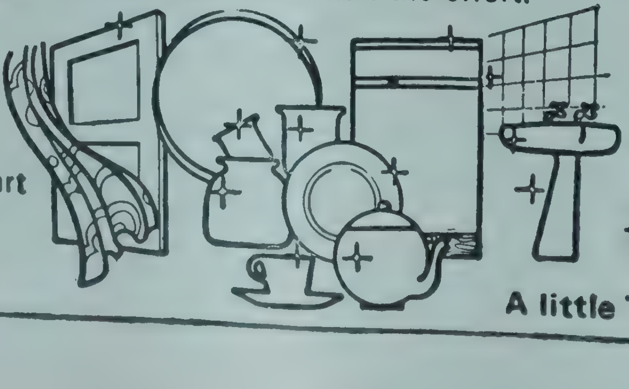
Teepol is a quality detergent formulation of Shell worldwide, which NOCIL (a Mafatlal-Shell Company) now brings to Indian housewives.

TEEPOL—drives dirt out faster

Teepol, being a liquid detergent, dissolves instantly in water. So you can start washing-up whatever you want right away.

TEEPOL—cuts grease instantly

Due to its powerful detergent action, Teepol wipes out every trace of grease. It cleans twice as well with half the effort.



TEEPOL—saves you money

Teepol is concentrated. You need to use only a little to do a great cleaning job.

TEEPOL—the versatile cleanser

It is the one liquid detergent that does the job of many. It cleans tiles, bottles, jars, windows, mirrors, woodwork, carpets, furnishings, dishes, cutlery, ovens, sanitary-ware and floors.

Marketed by:
NATIONAL ORGANIC CHEMICAL INDUSTRIES LIMITED
Mafatlal Centre, Nariman Point, Bombay-400 021.

A little TEEPOL does a lot of cleaning

CHAITRA-NOC-108

Exports of the 236 sample companies increased by 9.6 per cent to Rs 639 crores in 1979-80 from Rs 583 crores in 1978-79. Foreign exchange earnings of these companies increased by Rs 62 crores to Rs 670 crores in 1979-80 *i.e.*, 10.3 per cent. In contrast, foreign exchange expenditure of the sample companies went up by Rs 150 crores or 31.8 per cent from Rs 471 crores in 1978-79 to Rs 621 crores in 1979-80 causing thereby a decline in net foreign exchange earnings by Rs 88 crores to Rs 49 crores.

Castro's ghost at North-South dialogue

By A SPECIAL CORRESPONDENT

SO at the October summit of representative of rich and poor countries the United States is in, and Cuba is out. For about a year, the question of who should be invited has baffled the co-sponsoring leaders of Mexico and Austria. It got as difficult as the details of the agenda after Mr Reagan became President in the United States. He was not sure if he would like to attend. He was opposed to the presence of President Fidel Castro of Cuba — a fact which President Jose Lopez Portillo found so inconvenient because Cuba has done as much to cooperate with Mexico as it has to come into conflict with the United States. But without the United States, the International Meeting on Cooperation and Development — to give the Mexican summit the name christened in the report of the Brandt Commission — would lose its point and purpose.

It is to Cuba's credit that it has seen Mexico's dilemma. It has now come to its help as a friend by opting out of the meeting. Whatever the ways of repression, violence and subversion to which Cuba is wedded according to reporters who do not all belong to CIA, there is no doubt it could be a chastening experience for Cuba to have been invited to Mexico. Recently Janez Stanic, a Yugoslav journalist, wrote in *Communism's Crossroads* about Cuba's "burning desire for a messianic role in the world." Visions of this role and politico-economic relations with the Soviet Union have exacted of Cuba a heavy price in the past twenty years of economic mismanagement and stagnation. American "colonialism" has nothing to do with two decades of the downhill path Cuba's economy has taken, after Castro took over not only the commanding heights of the economy but the much smaller hills as well.

The "revolution" did away with small businesses, tiny shops and street

BUSINESS OPINION

THERE is a good potential for considerably expanding India's engineering exports to Cuba through a tripartite arrangement involving the Soviet Union, according to Mr P. M. S. Malik who was till recently India's Ambassador to Cuba. Addressing a meeting of the members of Association of Indian Engineering Industry in Bombay, he said that while the volume of direct visible trade to Cuba was very small, considerable exports to Cuba were taking place through third countries. For example, hand tools valued at over $ 1 million were being exported through UK and West Germany. Similarly, equipment for projects were going in through the USSR. India's engineering exports to Cuba could be easily stepped up to $ 15 million to 20 million per annum through a tripartite arrangement involving the Soviet Union, Mr Malik felt. Besides wishing to purchase Indian engineering products for use in Cuba itself, the Cuban organisations would be interested in procuring Indian goods and services for third country projects in which Cuba was involved.

One of the major inhibiting factors to a quicker growth of the Indo-Cuban trade has been the vast communications gap between the two countries. Cuba, till very recently, has had very little exposure to India's industrial growth in general and the engineering industry's capabilities in particular. This trend has been altered somewhat and some Cuban buying organisations have been to India to discuss with Indian manufacturers the potential for supplying plant and equipment to Cuba. A Cuban delegation had also visited the Indian Engineering Trade Fair and was highly impressed with the state of the engineering industry in the country today. Of late, Cuba has also shown interest in developing economic ties with India. This would encourage collaboration agreements being entered into between Cuban organisations and Indian firms. Areas in which such collaboration could be fruitfully entered into were sugar machinery, machine tools etc.

Mr Malik cautioned Indian engineering companies against looking at Cuba or any other Latin American market as a "quick return" market. It was important to adopt a selective approach to a few markets and India's presence ought to be registered in these countries through regular visits by Indian engineering company representatives. Cuban purchase organisations should also be invited to visit various specialised fairs in India, such as the Indian Machine Tool Exhibition which is scheduled to be held in Bombay in February 1982. Mr Malik clarified that, while generally shipping to Latin America was a problem, Cuba would not pose a similar problem as importers in Cuba were willing to accept supply of Indian engineering goods C & F Rotterdam basis.

MR H. B. Gupta, president, All India Small Scale Bright Bar Manufacturers' Association, has stressed the need to reduce the prices of iron and steel rounds used by the bright bar industry. The February 9 decontrol of mild steel rounds and the subsequent increase by the main producers in the prices of rounds by over Rs 1,200 per tonne, he points out, has only resulted in large quantity of rounds lying unlifted at the producers stockyards. The prices should, therefore, be fixed at a level bearable by consumers. Mr Gupta has also urged SAIL to abolish the extra of Rs 50 per tonne charged in the case of bright bar sizes. He observed that certain sizes like 14 mm, 20 mm, 36 mm, 40 mm, 42 mm and 45 mm had not been allotted to the bright bar industry for a long time and had become unavailable. Therefore, the main producers should undertake rolling of these sizes and supply them to the industry at the earliest. He also called upon TISCO and IISCO to supply squares which are necessary inputs. Despite these constraints, the industry had satisfactory progress during the last year and Mr Gupta hopes that with the adequate supply of raw materials being made this year, the industry would show further progress.

vendors. It placed the politically reliable but managerially incompetent at the helm of large nationalised enterprises. Between 1960 and 1978, Cuba has had an annual growth rate of *minus* 1.2 per cent per capita. From being one of the five richest Latin American states in 1959, today it is one of the poorest — with an yearly per capita national income lower than of Jamaica and Colombia. Had he been accommodated as a participant, President Castro would have learnt something worthwhile about economic growth, development and welfare.

Also, for the education of President Reagan, the Brandt Summit holds good promise. Already, at Ottawa, he too had to pay a price in agreeing to be present at the Mexico meeting. In spite of his known antipathy towards the United Nations, he agreed "to participate in preparations......for global negotiations" on the major issues of food security, trade expansion, energy exploration and balanced consumption, and developmental aid from the rich to the poor. Nobody will grudge the American officials their childish claim that President Reagan "walked away with all the prizes" from Ottawa. He did not. He has learnt that there is a price the United States will have to pay to belong to the comity of civilised nations. It is to extend the hand of cooperation and to see the suicidal folly of a policy of confrontation and stalemate.

Nevertheless, it is too early to say that the Mexico meeting will, as the Brandt Report has hoped, "launch ideas for a world economic recovery programme and enlarge prospects for global agreement." Obviously world summits do not solve all the world's problems. These can be tackled only when self-reliant endeavour is linked with international cooperation. But the summit decisions will need to be bold and imaginative, as well as down-to-earth, in paving the way to a more equitable distribution of the world's wealth. Including eastern Europe, North today hogs four-fifths of the world's income for its population which is a quarter of the global population. South, China included, has to make do with a fifth of the world's wealth for the remaining three-fourths of the population. This is an untenable situation since it militates against peaceful coexistence. The ways to remedy this worsening situation are well known and it will be the task before the participants at the Mexico meeting to forge the political will needed to take the remedial steps.

PLASTICS

Higher raw material costs

BOMBAY

THE plastics industry has been a major victim of the increase in prices of petroleum products. Labour unrest has also affected both raw material plants and processing units in the industry as was disclosed by Mr Dilip Piramal in his presidential speech at the 35th annual general meeting of the All India Plastics Manufacturers Association (AIPMA). The closure for the past six months of the polystyrene plant of Polychem Ltd. without any settlement in sight, has caused great hardship to many small scale plastic factories. In fact, many more plastic units in Maharashtra have been closed on account of labour problems.

In this situation, though the industry would stand to derive some comfort from the Government's decision to reduce the import duty on high density polyethylene from 155 per cent to 134.34 per cent, it is irked that the Government at the same time should have chosen to increase excise duty on this raw material from 27 per cent to 35 per cent. The AIPMA says that the excise duty on thermoplastic raw materials should not be more than 20 per cent, and has, therefore, urged the Bureau of Industrial Costs and Prices to make a thorough study of the price structure of various raw materials with a view to fixing a reasonable price. Recently two major manufacturers have slashed their prices. Polyolefins Industries reduced the basic price of high density polyethylene from Rs 15,778 to Rs 13,412 per tonne, while Indian Petrochemicals Corporation slashed LDPE from Rs 19,500 to Rs 16,500 per tonne.

Operations of many chemical industries, including plastics, have been affected in recent months by the poor availability of industrial alcohol. Among those affected are the low density polyethylene plant of Alkali and Chemical Corporation of India at Calcutta and the PVC plant of Chemicals and Plastics India in Tamil Nadu. The All India Alcohol based Industries Association has also drawn the Government's attention to this severe crisis and suggsted certain remedial measures, such as the rational distribution of alcohol, restriction of alcohol for potable purposes and fuller utilisation of distillery units' installed capacity.

Current estimated demand for plastic raw materials

Low density polyethylene	..	1,00,000 tonnes
High density polyethylene	..	65,000 ,,
PVC resin	..	1,00,000 ,,
Polypropylene	..	35,000 ,,

The AIPMA has, meanwhile, termed the Government's decision to subject alcohol-based LDPE and PVC resin units to higher rates of excise duty as highly discriminatory. It has urged a uniform rate of excise duty for both naphtha based and non-naphtha based plastic raw materials. It has also drawn attention to the indiscriminate imports of polyurethane leather cloth under OGL which has greatly affected the local leather cloth industry. It has urged the Government to slash the excise duty on thermosetting

Production of plastics raw materials (tonnes`

plastics, including polyester resin, to protect the local industry from extinction.

Despite all these odds, consumption of polypropylene has picked up to a great extent. The current production of polypropylene is around 20,000 tonnes. This is insufficient to meet growing demand estimated at 32,000—35,000 tonnes. Though actual users are allowed to import polypropylene, the high rate of duty at 191.10 per cent *ad valorem* makes the landed cost quite prohibitive. The AIPMA has pervailed upon the Government to reduce the duty to the same level as borne by HDPE. It has also taken up the case for reduction of import duty on engineering plastic raw materials at the meeting of the Development Council for Organic Chemicals. The support of the Petroleum and Chemical Ministry has also been sought for reducing the duty to 45 per cent, as in the case of the electronics industry. This should encourage the consumption of important engineering plastic raw materials such as poly acetal, PPO, polycarbonate, PTFE, Nylon 66.

The *Economic Survey* 1980-81 has recorded a negative growth rate for chemical industries including plastics for the year 1979-80. Plastics has had a negative growth rate of 8.5 per cent during 1979-80 over the previous year. Many suggestions have been made to stop the rot in the industry. Some of these are : rationalisation of the excise duty concession to small scale units, reduction of excise duty on plastic raw materials made from non-naphtha based feed stock, duty reduction for thermosetting resins and epoxy resin and reduction of import duty on polypropylene and engineering plastics raw materials.

cold !

Ensures efficiency, sustained refrigeration performance, longer life of all cooling systems.

MAFRON refrigerants match the performance of the best refrigerants on every count, including price:

- ☐ Totally dry, therefore safe and reliable.
- ☐ Conform to high international standards
- ☐ Subject to stringent quality control.
- ☐ Ensure peak efficiency, sustained performance, longer life of your cooling system.
- ☐ Easily available, in grades 12 and 22

No wonder MAFRON refrigerants have been the first choice for air-conditioning and refrigeration, on ships, naval frigates cargo vessels, etc.

Remember to specify MAFRON. Why ask for imported refrigerants under bond, when you can easily get MAFRON quality?

Safe, dry,
reliable

ICF coaches for Calcutta tube railway

MADRAS

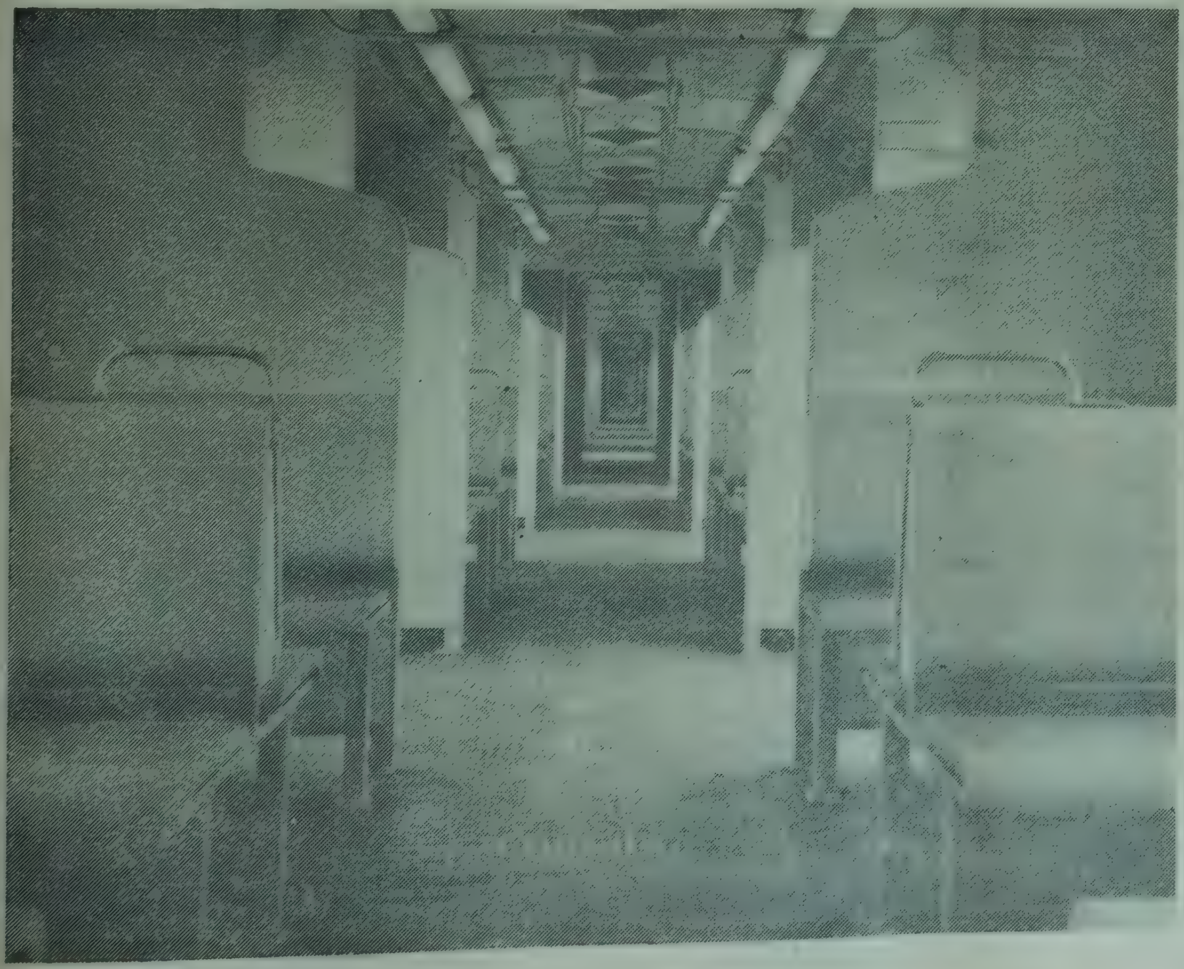
THE first four Metro coaches manufactured by the Integral Coach Factory (ICF), Perambur near Madras, for India's first underground railway will soon leave for Calcutta. The Metropolitan Transport Project, Calcutta, where the first underground rapid transit system of the country is taking shape has placed an order on ICF for the design and manufacture of 144 coaches required for the section.

Though original plan was to go in for foreign collaboration, the Railway Board later decided to entrust this challenging task to the ICF which has considerable experience in constructing over seventy types of coaches not only for the Indian Railways but also for export markets.

Of the 144 coaches on order, two trains comprising 8 coaches each have been programmed to be turned out as prototype trains to be run in a test section between Dum Dum and Belgachia, a distance of 1.5 km. The first prototype train has electrical traction equipment supplied by Bharat Heavy Electricals Ltd, Bhopal, and for the other train these will be supplied by NGEF, Bangalore.

ICF-built metro coaches for Calcutta underground railway

The metro coaches will be different from conventional electrical multiple unit coaches and suburban trains. The metro trains will be fully vestibuled. The control circuit is so designed that unless all doors of the train are closed the train cannot be started. A public address system will be provided to announce approaching stations. A special type of signalling system will indicate the track position ahead in the cab itself with an automatic feature to apply the brake if the driver fails to observe speed limits. There is also a proposal to introduce automation later. After trial runs in the next few weeks, the ICF will take up production of series coaches on schedule.



Metro coach interior

The Metropolitan Transport Project, Calcutta, has, in the first instance, taken up execution of the tube railway between Dum Dum and Tollygunj with a double track railway covering a distance of 16.43 km. While a 1.5-km stretch from Dum Dum will be on surface, the remaining will be underground except for a small stretch at Tollygunj. The railway will have 17 stations, the average intersection distance being 1.02 km. Eight car trains will run initially at two minute intervals, but it is hoped to increase the frequency later to 90 seconds headway. Each coach is 19.5 metres long and 2.75 metres wide with a capacity of about 300 passengers. Maximum speed will be 80 kmph. So much sophistication in design and manufacture has been attempted for the first time in our country without foreign technical help.

The current year's programme of the ICF envisages production of 720 coaches of a sophisticated product-mix comprising 108 electric multiple units, 16 metro coaches, 90 air-conditioned coaches including 10 metre guage air-conditioned sleeper and 30 brake vans for export to Nigeria, besides conventional coaches.

CORPORATE SECTOR

In the market

Hathwa Metals & Tubes

Hathwa Metals & Tubes Ltd (Registered Office: Hathwa House, Patna-800 001) is offering for public subscription at par 11.40 lakh equity shares of Rs 10 each totalling Rs 1.14 crores. The subscription list, which opened on September 3, will close on September 14.

The company proposes to set up a Rs 6.10-crore project to manufacture 1,200 tonnes per annum of copper and copper alloy pipes and tubes.

Other developments

Hindoostan Spg: Modernisation apace

Though sales of the Hindoostan Spinning and Weaving Mills Ltd increased 19 per cent from Rs 60 crores last year to Rs 75 crores this year, profits fell from Rs 352 lakhs to Rs 292 lakhs. Even in the current year, according to the chairman, Mr Sudhir Thackersey, the picture is not rosy. He told the annual meeting that the textile industry was going through a period of cost push inflation. Wages had gone up by Rs 90 per person per month. Power and fuel costs had gone up. Cotton prices had also gone up by 25 to 70 per cent between November 80 and now.

Mr Thackersey disclosed that the company had completed the first phase of its modernisation programme and had scheduled the second phase for completion by 1983. In the current year, the company's second rotary screen printing machine would be commissioned. The company also proposed to increase its processing capacities.

The sales turnover of the company for the first four months of the year increased from Rs 24 crores to a little over Rs 26 crores. The company's exports this year are marginally less than last year's figure of Rs 13.25 crores. Exports to the EEC and USA have come down considerably. The company has taken steps to increase exports to other areas.

Abhyudaya Coop Bank: Good progress

Abhyudaya Co-op Bank Ltd., has registered good progress during 1980-81 and has emerged as one of the six leading urban co-operative banks in the country.

The deposits of the bank crossed Rs 20 crores, 38 per cent over the previous year. This rate of growth has been maintained for the past four years. The bank has nearly 1.60 lakh depositors of whom 1.32 lakhs are savings account holders. The working capital of the bank has also shot up to over Rs 23 crores.

In regard to loans and advances also, the year 1980-81 has registered a net increase of Rs 3.26 crores in loans outstanding, thereby reaching a level of Rs 13.62 crores as on June 30, 1981. It is noteworthy that the credit deposit ratio of the bank was 67 per cent. The bank made a net profit of Rs 23.04 lakhs for 1980-81, a 50 per cent increase over the previous year. The bank proposes to maintain the dividend at 12 per cent.

The above progress has been achieved in spite of the fact that except for opening a branch at APMC Market, Turbhe, during the year, there has not been any branch expansion. With the obtaining of licences for opening three more branches, the bank looks forward to a more rapid growth in its operations in the following year. It has fixed an ambitious target of Rs 30 crores for deposits and Rs 20 crores for loans and advances for 1981-82.

Hindustan Brown Boveri: Sales rise

Sales and other income of Hindustan Brown Boveri Ltd for the year ended April 1981 increased to Rs 43.99 crores from Rs 38.55 crores in the previous year. The net profit, after providing Rs 1.66 crores (Rs 1.82 crores) for taxation, was Rs 2.23 crores (Rs 1.63 crores). The equity dividend recommended for the year under review is 17 per cent (16 per ment). An amount of Rs 13 lakhs (Rs 11 lakhs) is transferred to investment allowance reserve. The company has orders on hand worth Rs 82 crores.

Mukand Iron and Steel: Debenture issue proposed

Mukand Iron & Steel Works Ltd has reported higher sales for the year ended June 1981 at Rs 110.34 crores compared to Rs 78.91 crores in the previous year. The net profit, after providing Rs 1.23 crores (Rs 1.04 crores) for depreciation and Rs 3.10 crores (Rs 2.15 crores) for taxation, amounted to Rs 3.02 crores (Rs 1.56 crores). The equity dividend recommended for the year under review is 15 per cent (12 per cent). An amount of Rs 41 lakhs (Rs 17 lakhs) is transferred to investment allowance reserve and Rs 1.45 crores (Rs 49.61 lakhs) to general reserve. The company proposes to issue convertible debentures of Rs 7 crores subject to necessary approvals. The proceeds of the issue will be used for partly financing the company's modernisation programme costing Rs 20 crores.

Forthcoming company meetings

SEPTEMBER 5 TO SEPTEMBER 11

Diffident undertone

Bombay, August 28

There was a further decline in share prices during the week ended August 28 on renewed offerings and lack of fresh buying support. Marketmen restrained themselves from extending their commitments on fears of another anti-inflationary package. Activity was very much limited and the undertone was diffident.

For the major part of the week, equities encountered selling pressure. A worthwhile recovery was noted only on the concluding day of the week on emergence of support at lower levels coupled with the Finance Minister's assertion in the Rajya Sabha that there would be "greater deceleration" in the price level in the current financial year than last year.

In view of the continued weakness in pivotals, BSE took certain measures, apart from the removal of the daily margins on 10 scrips, by way of putting additional deposit margins on bears in the current account.

Century, which reacted sharply from the week's best level of Rs 821 to Rs 795.50, staged a rally on the final day of the week to close at Rs 805.50—indicating only a marginal net loss of Rs 2.50. Standard, however, dropped by seven points to Rs 520 and TELCO by 12 points to Rs 606 on renewed offerings.

SLM-Maneklal, which came in for heavy selling pressure in the preceding week following the discouraging performance for the year ended March 1981, plummeted further, by Rs 27.50 to Rs 170—a new low. Tata Steel and NRC declined by Rs 5.50 to Rs 344 and by Rs 5 to Rs 350. The other weak spots were Tata Chemicals, Tata Oil, ACC, Gwalior Rayon and Indian Dyestuff.

In the cash section, Bajaj Auto became the centre of selling following labour unrest at its plant and the likelihood of lock-out. The management has already put up a lock-out notice but it has been deferred at the intervention of the Maharashtra Government. The scrip slumped by 65 points to Rs 1,475. Despite the announcement two-for-five bonus issue and a record dividend of 42 per cent for 1980-81 against 27.5 per cent, Pond's also came in for profit-taking and the scrip lost 12 points. Caprihans was weak on passing over the dividend for 1980-81.

Market Gossip

Chowgule Steamships: Fresh issue

CHOWGULE Steamships propose to make a fresh issue of capital totalling Rs 2.33 crores. This is being done in pursuance of the Central Government's requirement that the shareholding of Chowgules be diluted to 40 per cent. Originally it was as high as 99.26 per cent but was brought down to 53.98 per cent in 1977 by issuing 35 lakh equity shares of Rs 10 each. The new issue will comprise 23.35 lakh equity shares of Rs 10 each. Of these 10,85,000 equity shares are being reserved for preference share allotment to the shareholders (other than Chowgules and their associates) who will be on the register of members on November 4, 1981. The balance of 12.50 lakh equity shares is being issued at par to the public. There is a provision that if any of the 10.85 lakh shares reserved for the shareholders remain unsubscribed, they will be added to the 12.50 lakh equity shares offered to the public. The company has recently announced 15 per cent dividend for the year 1980-81 and the Rs 10 share is currently ruling at Rs 19/20. The company has also announced an expansion plan which will increase deadweight tonnage of the fleet from 2.70 lakh to 5.65 lakh. The ships, three of which are on order with the Cochin Shipyard and two of which will be ordered from foreign shipyards, are expected to be added to the company's tonnage in next three or four years. The company is confident that its increased tonnage will be gainfully employed.

Sugar for whom?

SUGAR appears to be losing its buoyant undertone prevailing for some months past and prices have come down in retail markets to Rs 5.20 to Rs 5.60 per kg from Rs 7 or so a few weeks ago. The much desired fall in prices, awaited eagerly by consumers as the festive season is approaching fast, has come about in the wake of a correct step, though rather belated, taken by the Government to announce higher sale quota for September. Prices had started falling immediately after the quota was announced, and sugar traders were naturally in panic. The Bombay Sugar Merchants Association, in order to protect interests of its members, tried to fix some sort of floor price for sugar, with the result prices began looking up again. However, not all its members appear to be keen on floor price. The sugar trade in general, and consumers in particular, have objected strongly to the idea of artificially pegging prices instead of leaving them to be determined by natural demand and supply forces.

In any case the local body of sugar merchants has lost its face. The question that is being asked repeatedly: why did not the association fix a ceiling price when sugar prices were spiralling? Its contention that sugar bought at earlier high prices cannot be sold at a loss is also not convincing. Then why does not the trade sell sugar bought by it at lower prices at the same price when market prices are going higher? All this only proves that the sugar trade wants to have its cake and eat it too. Happily however, sugar prices have begun coming down again in response to demand-supply forces and consumers only wish that the downtrend will persist till the time new season sugar starts flowing into the market. Meanwhile, there is some speculation as to the mode of selling imported sugar, the first lot of 12,000 tonnes of which has already arrived at Tuticorin and two more consignments totalling 21,000 tonnes are expected to land as this is written. It appears instead of supplying this sugar through public distribution channels, the Government is thinking of selling the same to the trade through auctions. If that comes about, the Government would have played into the hands of unscrupulous traders and its objective of supplying this essential commodity to consumers at a reasonable price will remain only on paper.

A gold price formula?

GOLD experts always differ in their assessment of the possible movements of the yellow metal's prices. They have to take various factors into account and naturally what weightage to attach to each factor is a subjective judgement. Now International Gold Corporation, the marketing wing of the South African Chamber of Mines, has come up with a formula which it believes is much more reliable. The complex formula for gold price incorporates the political tension index with three other variables: inflation in major world currencies, interest rates and the exchange rates of the US dollar with inflation being given the greatest weight. International Gold claims that this pricing model is 87 per cent accurate. But the market people want to know more details before they pronounce a judgement. The reaction is generally sceptical for the traders say gold is an emotional market that is not subject to any formula.

State loans

ALL the 20 state government loans for a total of Rs 457.25 crores have been fully subscribed. Banks, Life Insurance Corporation and general insurance companies reportedly extended their full support to the loans, subscription lists of which were closed on the opening day itself. The cash-cum-conversion loans carry an interest of 7 per cent and will be redeemable at par after 12 years. Maturing loans of 15 state governments totalled 170.57 crores and were eligible for conversion.

UP headed the list totalling a loan of Rs 84 crores. Other state loans were: Andhra Pradesh (52 crores), Rajasthan (38 crores), Maharashtra (35.20 crores), Tamil Nadu (34.05 crores), Gujarat (29 crores), Bihar (25.5 crores), Kerala (24 crores), Orissa (23.75 crores), Karnataka (22.75 crores), West Bengal (19.75 crores), Madhya Pradesh (19.25 crores), Haryana (14 crores), Punjab (12.25 crores), Assam (11.05 crores), Nagaland (3.75 crores), Tripura, Manipur and Jammu & Kashmir (2.75 crores each) and Himachal Pradesh (1.75 crores).

COMMODITIES

Cotton prices steady

Bombay, August 31

Quietly steady conditions prevailed in the spot cotton market during the past week. Pending further light on the prospects of early arrivals of Pakistan cotton, there was limited support from the traders towards fresh purchases. In the event, a few varieties, in fact, showed a loss of Rs 50 per candy.

Indications are that a delegation comprising representatives of the Indian Cotton Mills' Federation, the Cotton Corporation of India and the Union Commerce Ministry might take a trip to Karachi. The purpose of the visit, barring renewing old contacts, is not very clear.

Meanwhile, reports from New Delhi indicate that the Commerce Minister had been rather annoyed that the entire Pakistan deal had been turned virtually into a farce. Why was so much fuss made about the acute shortage of short and medium staple cotton, presenting a picture of a critical statistical position, needing as much as ten lakh bales for making effective correction and why there has been such a lukewarm reception when one lakh bales had been negotiated for import? The Ministry is apparently in no mood to listen to the practical difficulties presented by the industry. The cotton import from Pakistan had been successfully negotiated after persuading the agricultural lobby, which had all along been very keen about exports than about imports.

Textile industry circles, however, are caught in a piquant situation. The mills cannot rouse the wrath of the Government by continuing to be indifferent about booking their requirements for Karachi cotton for fear of some punitive action or the other. The Indian Cotton Mills' Federation has alerted the concerned parties to expedite their booking of Pakistan cotton.

The mills have not been able to extend enthusiastic support for Karachi cotton for a variety of reasons. The CCI, which plays the role of the honest broker, has been insisting on getting its pound of flesh, that is 1.5 per cent commission or brokerage for just doing the referee's job as it were. At a time when equivalent indigenous cotton prices are seeking lower and lower levels, the industry is of the view that the CCI could extend some help by accepting a quarter per cent commission, which could mean a price differential of Rs 50 per candy.

Meanwhile, the Cotton Advisory Board, which met in Bombay, towards the end of the past week, confirmed that the carry-over would be reduced to a new low of 8.72 lakh bales at the end of the current season, hardly sufficient to meet a little over one month's consumption, a situation that had been apprehended by the textile industry while projecting the need for ten lakh bales of cotton imports some time in April this year! And the Textile Commissioner finds nothing panicky about it!

The following has been the trend of prices of some of the leading varieties :

(Rs. per candy)

	August 28	August 21
Digvijay	5,000-5,100	5,000-5,100
Kalyan	4,700-4,800	4,700-4,850
Saurashtra CO2	4,850-5,050	4,900-5,100

Upward trend in yarn

Bombay, August 31

An upward trend was noticed in the local yarn market during the past week. The prices of 150D NRC, 120D NRC, 150D CR and 120D CR increased by Rs 0.13, Rs 0.27, Rs 0.68 and Rs 0.42 to Rs 51.76, Rs 54.10, Rs 51.76 and Rs 54.10 respectively. The prices of 100D SIV and 150D Acetate, however, remained unchanged at Rs 61.12 and Rs 49.01 respectively.

Restricted activity in jute goods

Calcutta, August 24

With fresh interest restricted, activity in jute goods in the Calcutta gunny market during the past week was at a low level. Prices declined in early trading but recovered partially in the latter part of the week in the wake of speculative buying credited to dealers. It was pointed out by trade sources that the recovery was aided by rumours that the Indian Jute Mills Association was proposing to the Government shortly a block closure of mills to meet the current situation in the industry created by large accumulated stocks because of recession in demand.

The stalemate in trading was ascribed to slow buying on account of both domestic and overseas buyers. With the annual festival close ahead it was felt by the trade that the current sluggishness in demand might continue for some time more.

The acreage and yield of raw jute in West Bengal this year are lower than that of last year, according to a snap calculation. The acreage is lower by about 80,000 hectares and yield by about 20 per cent. This, according to reports available here, is due to farmers diverting their land to other crops and partly due to the State Government's stand that jute cultivation would be reduced if the growers did not get a remunerative price for their produce, beside late announcement of the minimum price for jute.

The Jute Corporation of India will shortly announce the minimum prices for the different grades of raw jute payable to the growers of south Bengal, according to Mr A. K. Moitra, chairman-cum-managing director of JCI. He said JCI would buy a total of 8.25 lakh bales from south Bengal. He said that efforts were being made to encourage the farmers to cultivate better quality of jute.

Meanwhile reports from upcountry reaching here said that the prices of raw jute in north Bengal have slumped in spite of extensive support operations by the Jute Corporation this year. The reason is the absence of jute mills from the market. Growers in the early grown areas like north Bengal, Assam and Bihar are being forced to dispose of their jute at Rs 12 per quintal below the minimum price fixed by the Government.

Oilseeds : All-round fall

Bombay, August 31

Nervous selling in groundnut oil following raids by income-tax authorities on the premises of a number of oil traders in Bombay, Gujarat, Madhya Pradesh and Andhra Pradesh affected the entire oilseed market during the past week.

Groundnut oil, which lost Rs 5.72 in the previous week, declined further by Rs 9.36 to Rs

CORRIGENDUM to Public Notice under Section 22 Sub-Section (2) of Monopolies and Restrictive Trade Practices Act. 1969 read with Rule 4A of MRTP Rules 1971- published in 'Commerce' issue of 14-2-1981.

In the earlier Notice dated 14-2-1981 the face value of shares was incorrectly indicated as Rs. 100/-. The correct particulars of Item (iii) of the Notice should read as follows :

Authorised capital : Rs. 1 crore
Paid up capital : Equity Rs. 80 lakhs

Share capital of the Company is divided into 10 lakh equity shares of Rs. 10/- each. Initially the Company proposes to issue 8 lakh equity shares of Rs. 10/- each.

For and on Behalf of Palm Hotels (India) Ltd.

Sd/-
S. K. MUKERJEE
Director

Dated this 21st day of August, 1981.

149.24 per 10 kg—a marked fall of Rs 15.08 in just two weeks. As a result of nervous selling in groundnut oil, groundnut also retreated sharply. Karad bold, Saurashtra bold and Saurashtra quality dropped by Rs 22 each to Rs 618, Rs 623 and Rs 628 per 100 kg.

Due to marked weakness in groundnut oil and lack of fresh buying , imported oils also lost significant ground. Palmoleine yielded Rs. 4.16 at Rs 143.52, soyabean Rs 10.44 at Rs 132.08 and RBD Rs 9.46 at Rs 120.54 per 10 kg.

Selling pressure also mounted on castor, linseed and their oils. Madras small and Kanpur fell back by Rs 8 each at Rs 320 and Rs 312 per 100 kg. Castor commercial oil and BSS oil slipped back by Rs 2.50 each to Rs 68.25 and Rs 73.25 per 10 kg respectively.

Linseed bold reacted by Rs 12 to Rs 530 per 100 kg and its oil by Rs 4.12 to Rs 68.25 per 10 kg.

An easy trend prevailed in cakes also but cottonseed was an exception with a gain of Rs 125 per tonne. Castor, however, again remained steady.

Comparative prices in rupees per quintal of seeds and per 10 kg of oils :

	29-8-1981	22-8-1981
G. nut Karad bold	618.00	640.00
G. nut oil	149.24	158.60
Cast. Md Small	320.00	328.00
Cast. oil com.	68.25	70.75
Cast. oil BSS	73.25	75.75
Linseed bold	530.00	542.00
Linseed oil	129.00	133.12

Grains divergent

Bombay, August 31

A divergent trend featured trading in grains in the local market during the week. Wheat and pulses displayed weakness, while rice (basmati) and jowar showed firmness.

In cereals, wheat declined due to good inflow of Punjab varieties. The superior variety eased by Rs 10 to Rs 280-300 per quintal. Local stockists were keen sellers. The undertone was subdued. Buyers were reserved. Advices from producing centres were discouraging. The Saurashtra variety was offered rupees five lower at Rs 210-230 per quintal.

Rice (basmati) was in good demand at Rs 450-700 per quintal (showing an increase of Rs 50 per quintal), on account of limited inflow because of the fag-end of the season. Surti Kolam ruled unchanged at Rs 340-400 per quintal. Demand was slack. Sellers were active. The inflow was good from the South. Arrivals averaged 1,500 bags per day.

In coarse grains, jowar was in short supply. Sellers were quoting rupees five higher at Rs 200-225 per quintal. Bajra was traded at Rs 185-260 per quintal and maize at Rs 185-190 per quintal showing no change over the week.

Among pulses, gram receded by Rs 21 to Rs 390-407 per quintal. Local demand was slack. Millers refrained from lifting gram for crushing. The inflow of gram dal was about 500 bags per day.

Sugar firm

Bombay, August 31

Sugar prices displayed firmness in the local market on renewed buying support. The price of sugar C-30 increased by Rs 25 to Rs 564-571 per quintal. Local dealers and bulk consumers were active. Sugar stocks at the weekend declined sharply to 906 bags as against 3,967 bags in the preceding week. The price of C-30 grade was lower by Rs 282 per quintal as compared with the corresponding price a year ago.

The State co-operative factories improved their quotations from the week's low price of Rs 485-490 per quintal to Rs 520-525 per quintal in the face of encouraging support from Gujarat buyers.

Gold spurts, silver plummets

Bombay, August 31

While gold prices spurted to reach a new high, silver prices plummeted in the Bombay bullion market during the past week.

NOTICE

It is hereby notified for the information of the public that CIBA-GEIGY of India Limited, 14, J. Tata Road, Bombay-400 020 proposes to give to the Central Government in the Department of Company Affairs, New Delhi, a notice under sub-section (1) of Section 21 of the Monopolies and Restrictive Trade Practices Act, 1969 for substantial expansion of its activities. Brief particulars of the proposal are as under :

(i) Name(s) person(s)/body corporate owning the undertaking : CIBA-GEIGY of India Limited

(ii) Capital structure of the applicant undertaking : The authorised and paid-up capital of the Company as on 31-12-1980 is Rs 138,937,500/- divided into 1,389,375 equity shares of Rs. 100/- each.

(iii) Details of the proposed substantial expansion :
  (a) Names of new goods to be produced, supplied, controlled or distributed or of new services to be rendered : Manufacture of Isoproturon and Isoproturon based formulations
  (b) In the case of substantial expansion of existing activities :
    (i) Names of goods : The Company is currently manufacturing pesticides at its Goa Plant where it is now proposed to manufacture Isoproturon and Isoproturon based formulations.
    (ii) Capacity before expansion : Nil
    (iii) Expansion proposed : Isoproturon technical —500 tonnes per annum
    Formulations based on Isoproturon technical —Equivalent to 500 tonnes of technical material
    (iv) Location of the project for substantial expansion : At the Company's existing plant site at Santa Monica, Corlim, Ilhas, Goa.
    (v) Brief outline of the cost of the project, the scheme and sources of finance : The estimated capital investment of Rs. 26.5 mio. will be financed primarily from the retained earnings of the Company.

2. Any person interested in the matter, may make a representation to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this Notice, intimating his views on the proposal and indicating the nature of his interest therein.

BOMBAY 400 021

General Notice under the M.R.T.P. Act, 1969

Pursuant to Rule 4-A of the Monopolies and Restrictive Trade Practices Rules, 1970, it is hereby notified to the members of the public that in accordance with Section 21 (3) (d) of the Monopolies and Restrictive Trade Practices Act 1969, the above named Company proposes to apply to the Central Government for modification of the order No. L/43/74-M (III) dated 21st July 1975, so as to acquire ships of a total DWT of about 1,25,000 costing not more than Rs. 65 crores. Any person interested in the matter may, if he so desires, intimate to Central Government in the Department of Company Affairs, New Delhi, within fourteen days from the date of publication of this notice, his views with regard to the above proposal and also the nature of his interest therein.

Bombay, the 31st August, 1981.

THE TITAGHUR PAPER MILLS COMPANY LIMITED

At the meeting dated the 22nd August, 1981, the Board of Directors has recommended payment of the following dividends for the year ended 31st March, 1981, subject to deduction of tax at source and to the approval of the shareholders at the Annual General Meeting to be held at the main hall of the Bengal Chamber of Commerce and Industry, Netaji Subhas Road, Calcutta-700 001 on Wednesday, the 30th September, 1981 at 11.00 a.m. for which notice and the agenda are being mailed to the Members.

A) On 1st cumulative preference shares at the rate of 10.4% p.a.

B) On 2nd cumulative preference shares at the rate of 5.85% p.a.

C) On preferred ordinary shares at the rate of 13% p.a.

*D) On 'A' and 'B' ordinary shares at the rate of 8% p.a.

* Subject to the approval of the Lending Institutions.

Pursuant to Section 154 of the Companies Act, 1956, the Registers of Members shall remain closed from 15th to 30th September 1981, both days inclusive.

Eligible members are requested to submit to the company, the Form No. 14B, in duplicate, on or before 30th September, 1981 in order to claim exemption under Section 194 of the Income Tax Act, 1961.

By Order of the Board
K. GHOSH
Director and Secretary

Dated, the 22nd August 1981.

Regulation of credit to industry

Concluded from page 452

1979-80, the following observation occurs: "In June 1979, it was indicated to banks that the credit expansion in the fiscal year 1979-80 should be 'significantly less' than in the last year. As a means of achieving this end, banks were asked to exercise great care and discretion in allowing enhancements to existing large credit limits (above Rs 50 lakhs) and to discourage the extensive reliance of large borrowers on bank funds for working capital needs."

It is time to infer that banks cannot be expected to be flush with funds merely because of the pursuit of directions not to extend credit to existing borrowers beyond previous limits whereas the main purpose of banks would be to be able to see the full justification of the demand for credit. There can be no useful method by which, for instance, any authority can be created to so draw away from banks the surplus funds for being utilised by several units in the priority sectors. The basic principle behind the pursuit of the philosophy of diverting bank credit from large scale and medium scale industry to small scale units and other kinds of enterprises needs to be studied in depth by the government itself to give some scope to finding out methods of actually pursuing the philosophy in terms of practical benefit.

One is somewhat intoxicated by the cocktail between thoughts on theory behind policy formulation and the ramblings of ideas through the incompetence in practice of the theory itself. But some refrain from atleast overhanging is provided by a few thoughts included in the presidential address of Mr I. G. Patel (now the Governor of the Reserve Bank of India) at the 49th annual conference of The Indian Economic Association at Calcutta in December 1966 (when he was attached to the Ministry of Finance): "A certain amount of controversy is inherent in a society in a state of rapid but inchoate transition where agreement on the constraints on the economic system and its ultimate destination is difficult to come by. It is also arguable that the realm of economic policy and the realm of economic theory overlap only at the rather uninteresting periphery which cannot hold the attention of more agile minds; our indifference or scepticism is perhaps fortified by lack of will to wield the means on the part of society at large. But there is no other country where it is more appropriate for economists to recall that 'it is not wonder, but rather the social enthusiasm which revolts from the sordidness of mean streets and the joylessness of withered lives, that is the beginning of economic science.'"

Could we conclude that the Chore group came because of this kind of social enthusiasm; perhaps, the enthusiasm would be seen to be more prolific of practical ideas if the banks themselves were asked to go into deeper understanding of the credit structure they had to be maintaining. Why not let the Indian Banks Association really become a kind of chamber of commerce like so many other specialised chambers of commerce. The pursuit of social enthusiasm would be much more beneficial for society itself then.

Beyond headlines

Regulation of credit to industry

By VERITAS

LINK between money supply and the growth of the economy cannot easily be assessed although this seems an essential requirement before any policy formulations can be made regarding the regulation of credit to industry and trade. It is significant to note that the much talked about Chore Committee was set up on April 4, 1979 (when the Prime Minister was Mr Morarji Desai and the Finance Minister was Mr Charan Singh) and was expected to submit the report by May 15, 1979, that is, within a period of five weeks. The report was submitted in August 31, 1979, that is within, say, five months instead of five weeks. By that time the Central Government had changed with Mr Charan Singh as the Prime Minister, but a Prime Minister with a great difference in the sense that he was asked by the President not to bring any great changes in policy as there was bound to be a fresh election to Parliament very soon. Even so, it may be interesting to note that the Chore Committee report was given some serious attention by the new government. It was in December 1980, that is, almost a year after the new government was formed, the Reserve Bank of India announced its decision to accept a good part of the recommendations of the Chore Committee, mostly relating to the principle of forcing banks to know more and more about the actual functioning of the credit seekers and to call upon the credit seekers to put into both fixed capital and working capital a substantial part of the profit which would otherwise go into other business ventures or expanded consumption expenditure.

It is not necessary here to point out that the authority concerned at the time of the appointment of the Chore Committee was particularly interested in bringing about great changes in the manner of regulating credit but it is certainly interesting to note the following observation of the Committee in respect of the main term of reference it had to deal with namely, to suggest "alternative types of credit facilities, which would ensure greater credit discipline and also enable banks to relate credit limits to increases in output or other productive activities".

"A study of bank borrowings in relation to the increase in the index of industrial output in conjunction with the price index may not, however, reflect the precise position, as the weightage given in the price index would probably distort the picture to some extent. The Group understands that some attempts have been made in the past to study the increase in bank borrowings in relation to industrial output in conjunction with the price level index. Because of the limitations in such a system of comparison and as the data were comparatively old, the Group has not been able to make use of such studies. As this issue is obviously of great concern to the monetary authorities and as the question has often been raised in the context of the increases in bank borrowings, the Group recommends that the Reserve Bank may undertake a detailed scientific study of this aspect." The chairman of the group, Mr Chore and two of the five members of the group are in the Reserve Bank of India and noting that the time taken by the group was much longer than originally suggested as the time required for the study, it is rather difficult to understand why there has been little such attempt by the group. The main study required has not been done. Whether such a study is now being done in the Reserve Bank is not known.

However, the Chore group did have to make some recommendations and the recommendations necessarily have to be based on some findings. One important finding actually relates to the main term of reference noted above. This is as follows : "Though the gap between the sanctioned limit and utilisation is substantial and the possibility of its misuse during periods of credit restraint cannot be ruled out, there was no empirical evidence to show that the gap was so misutilised." The observation and the conclusion are both illustrative of an almost totally academic approach to an enquiry into available data whereas the appointing authority was at least profoundly influenced by the lack of opportunity to take up such a study of the available data that would promote the formulation of a policy of credit control and regulation to help elimination of credit seekers, with legitimate purposes to pursue, out of the practical compulsion to seek credit in the unorganised sector.

It is interesting in this context to recall a commentary from the Reserve Bank of India's annual report for 1978-79. Referring to the extraordinary share of currency in money supply in 1978-79, the report said that the reasons for this increase were not clear but still said as follows: "Factors such as the scale of procurement operations and the delays and disruptions in banking services in the past year may have been of some influence. Nonetheless it is too early to say whether the high currency component of the money supply increase in the year under review is a temporary aberration or is indicative of a basic shift in the asset preference of the public." It is possible to argue that the Chore group would not have been interested in making the study implied in this observation. Even so, it cannot be overlooked that as modernisation of the economy proceeds there can be substantial increase in the share of other items than currency in the money supply.

The preference for currency has both political and other non-economic implications, a subject which is not easy to divulge. However, in the annual report of the Reserve Bank for 1978-79 the following observations were also made: "This phenomenon of currency expansion has a short-run as well as a long-run implication. In the short run, the growth in currency with the public implies a smaller increase in bank deposits on which secondary expansion is based. However, any sharp reversal of this feature with a pronounced shift from currency to deposits would, by greatly enhancing the liquidity of banks, further aggravate the problem of controlling credit expansion. But in the longer run, the persistence or continuance of the feature of currency preference by the public could, by restricting the area of operation of monetary policy, reduce the effectiveness of the policy measures. This would mean, among other things, an increase in the non-bank funds available for maintaining stocks which, in turn, would necessitate the formulation of policies for directly controlling the hoarding of sensitive commodities."

While it is difficult not to agree with these observations, it is at least necessary to say that there is need for greater and continuous study of the sources of non-bank credit. Indeed, it is not necessary to be a cynic to say that the Reserve Bank was itself directing credit seekers to go to sources other than banks; for, for instance, in the annual report for

COMMERCE RESEARCH BUREAU

PREMIER CENTRE
FOR MONITORING CURRENT
DEVELOPMENTS IN THE INDIAN
ECONOMY

* The research work of the Bureau is organised through these nine Divisions :

(1) Agriculture,
(2) Industry,
(3) Corporate Sector,
(4) Regional Economics,
(5) Banking and Finance,
(6) International Economics,
(7) Unorganised Sector,
(8) Science and Technology, and
(9) Special Studies.

* Each Division is manned by experts who have specialised in their respective subjects.

* Over the years the Bureau has built up a comprehensive economic data system which is the only one of its kind in the country today.

* Through its studies published in the "Commerce" weekly and its special numbers, the Bureau has established a high reputation for itself.

* Its exclusive and prestigious "Economic Monitoring Service" is subscribed to by some of the foremost organisations in the public and private sectors.

PEOPLE

Viswanathan

Mr Balwant Rai has been elected chairman of the consultative committee of City Chambers of Commerce, Madras, for the year 1981-82. Mr Rai is also the president of Hindustan Chamber of Commerce.

Mr P. K. Viswanathan has taken over as director (marketing) of Bharat Petroleum Corporation Ltd, a Government of India undertaking. He will be on the board of directors of the corporation.

Mr P. N. Vencatesan, who has been the managing director of The Premier Automobiles Ltd since March 1977, has also been appointed vice-chairman of the company from August 5, 1981. Mr Vencatesan, who is a qualified chartered accountant, was with Esso for 12 years before he joined PAL in July 1964 as the controller of accounts. Later he came to be entrusted with many more responsible positions in the company. In the last three years he has made determined efforts to pull PAL out of all its troubles.

Vencatesan

Srinivasan

Mr N. Srinivasan has taken over as chairman and chief executive officer of the Dhanalakshmi Bank Ltd, Trichur. He has had 30 years' experience in the banking industry and was associated with Grindlays Bank Ltd before coming over to Dhanalakshmi. Mr Srinivasan holds a master's degree in economics from the Madras University and is also a certified associate of the Indian Institute of Bankers. He is also the author of a book "Bankers' Guide to Bills".

Mr Bathini Nagabhushanam has taken charge as general manager of the Andhra Pradesh State Film Development Corporation Ltd, a State Government undertaking. Mr Nagabhushanam, who was till recently the liaison officer at the Ramangundam division of the Fertiliser Corporation of India, did his post-graduation in public administration from Osmania University, and takes keen interest in cultural associations of Hyderabad-Secunderabad.

Nagabhushanam

Kishore

Mr A. V. Kishore, who is the new executive director of Andhra Pradesh Electronic Development Corporation Ltd, a State Government undertaking, is an electrical engineer by profession and is also a member of the Indian Institute of Plant Engineers. Mr Kishore, who earlier worked with the Bihar State Electricity Board, Bhilai and Bokaro steel plants, came to Andhra Pradesh Industrial Development Corporation Ltd in March 1973 where he was till recently general manager (project promotion).

THE WEEK

Oil and Natural Gas Commission has struck oil in a new structure 35 km east of the Bombay High oilfield. The flow from this well is about 1,030 barrels a day, Mr P. C. Sethi, Union Minister for Petroleum, informed the Lok Sabha. Also oil has been discovered in small quantities in new wells in Assam and Gujarat. ★

Crude oil imports in 1982 are expected to decline to 14 million tonnes from the planned 16 million tonnes in the current year. The reduction would mean a saving of Rs 800 crores in foreign exchange. ★

The Government has turned down the plea of the private sector textile mills for permission to produce controlled cloth. The permission if granted will hit the government-owned National Textile Corporation mills. ★

Engineering Projects India Ltd has emerged as the top exporter of engineering products fetching Rs 122 crores in 1980-81, according to data prepared by Association of Indian Engineering Industry. ★

The Government has canalised import of pig iron in any grade through Steel Authority of India Ltd with immediate effect. Hitherto these imports were under open general licensing. ★

The Union Government has decided not to grant assistance from the Shipping Development Fund Committee to such companies as are planning to diversify into shipping business, according to Mr Veerendra Patil, Union Minister for Shipping and Transport. ★

Coal production target for 1981-82 has been raised by three million tonnes to 124 million tonnes. If achieved, this would mean a nine per cent increase over last year's production of 114 million tonnes. ★

A national handloom expo will be held at Hyderabad from November 1, according to Dr N. P. Seshadri, joint handloom commissioner. ★

The Government has approved a Rs 2.18-crore proposal for a feasibility study in the Gulf of Kutch to produce energy from tidal waves, Minister of State for Energy, Mr Vikram Mahajan, told the Rajya Sabha. ★

The first shipment of Pakistan cotton consisting of 30,000 bales is expected to land at Bhavnagar next week. ★

The exchange rate between the Indian rupee and the Russian rouble has been revised from September 10, 1981, to Rs 9.7247 per rouble from Rs 9.4137 earlier. ★

Wholesale price index

At 289.2, the latest available official wholesale price index for the week ended August 22, 1981 showed a rise of 0.5 per cent over the preceding week and 11.1 per cent over the year.

Money stringent

Conditions were tight in the Bombay short-term money market as on Monday (September 7, 1981). Both notified and commercial funds were renewed at ten per cent. Fresh money was also transacted at ten per cent.

COMMERCE

Idle fertiliser capacity

THE future of the country depends on the amount of investment that is made on the development of different sectors of the economy. However, investment by itself does not assure the desired results, as the experience with the fertiliser industry so eloquently shows. There has been tremendous growth in the industry: fertiliser production in 1979-80 was 2.2 million tonnes of nitrogen against just 10,000 tonnes in 1950-51. During the same period the production of P_2O_5 rose from 8,000 tonnes to 7,50,000 tonnes. India is now the fourth largest fertiliser producer in the world. The fertiliser industry involved a capital outlay of Rs 2.496 crores during 1979-80 of which the major share (Rs 1,938.3 crores) was accounted for by the public sector and the co-operatives and Rs 557.3 crores by the private sector. At the end of 1980 the fertiliser projects under implementation involved a financial outlay of Rs 2.181 crores, of which again the public sector accounted for Rs 1,803 crores and the private sector Rs 378 crores.

Despite the impressive growth in fertiliser production the consumption has always exceeded indigenous production necessitating large-scale imports, affecting adversely the balance of trade. During 1980-81 the deficit of N was 1,546 thousand tonnes and that of P_2O_5 was 391 thousand tonnes. In terms of percentage to total consumption the deficit amounted to 42 per cent in the case of nitrogen and nearly 32 per cent in the case of P_2O_5 As there is no known source of potash the entire requirement of K_2O had to be made through imports.

Since without an adequate dose of fertiliser agricultural production cannot improve, the imports of fertilisers could have been considered worthwhile if they had become inevitable after exhausting all avenues of augmenting fertiliser supplies from indigenous sources. Unfortunately this cannot be stated to be the case. Year after year the capacity of the fertiliser industry has remained very much underutilised. During 1980-81 the capacity of the fertiliser industry was utilised only to the extent of 53 per cent and 1.5 million tonnes N were imported. If the capacity of the fertiliser industry had not been so grossly underutilised perhaps the bulk of this importer quantity could have been produced within the country itself.

In this context the urgent need to secure a better capacity utilisation of the fertiliser industry can hardly be overemphasised. A review of fertiliser consumption and production in 1980-81 made by the Fertiliser Association of India identifies as the major constraints in achieving a better capacity utilisation primarily poor performance of the infrastructure sectors, more particularly power, coal, transport and non-availability of essential raw materials. The two coal-based fertiliser projects at Ramagundam in Andhra Pradesh and Talcher in Orissa, which went into commercial production during the year, remained severely underutilised because of constraints in power supply. Problems of industrial relations affected the production seriously in a few plants. Nevertheless six nitrogenous complexes and seven SSP plants achieved over 80 per cent capacity utilisation.

Apparently while setting up capacity, enough of thought had not been given in some cases to the requirement of its utilisation. This is particularly true in the case of the public sector units. For example, the Talcher unit of the Fertiliser Corporation of India is suffering from teething troubles which cannot be got over without an extra gasification unit and boiler to stabilise operations at an acceptable level of capacity utilisation. But to add this extra unit and boiler would take quite some time. The performance of the other coal-based unit at Ramagundam has again been far from satisfactory and requires for improvement an extra gasifier and boiler and the installation of an additional NO removal unit.

The capacity utilisation is particularly low in the public sector enterprises which again account for the bulk of the investment in fertiliser industry. The consequence has been the recurring losses incurred year after year. The combined operational losses of the six public sector fertiliser enterprises during the five years 1975-76 to 1979-80 amounted to over Rs 290 crores. Moreover a sizeable portion of investment was locked up in capital works in progress in the fertiliser enterprises in the public sector. At the end of March 1980 funds to the extent of Rs 676 crores were lying blocked in projects and schemes waiting to go on stream. During the Sixth Five Year Plan the objective is to have an outlay of Rs 2,367 crores on the fertiliser industry in the Central sector. If the projects undertaken are not completed expeditiously much of this outlay is likely to remain unproductive.

During 1981-82 the performance of the fertiliser industry has been somewhat better than during 1980-81. However, the improvement has been very much impeded by the power shortage from which several units—both in the public sector and in the private sector — continue to suffer. The total capacity of nitrogenous and phosphatic fertiliser industry by the end of 1981-82 is likely to be 5.31 million tonnes of N and 1.56 million tonnes of P_2O_5 . Production is expected to be of the order of 3.1 million tonnes of N and nine lakh tonnes of P_2O_5 .

The Fertiliser Association of India (FAI) has expressed uneasiness over the impact of the rise in fertiliser prices on the use of fertiliser by the cultivators. According to FAI the sharp increases in fertiliser prices in 1980 made input/output price relationship unfavourable to the farmers and inhibited fertiliser consumption in most parts of the country. The Government of India was aware of this fact and had sought to mitigate the harshness through raising procurement prices which, according to FAI, did not succeed in neutralising the impact of the increased fertiliser prices. The FAI has warned that the recent hike in fertiliser prices will result in a much slower growth in fertiliser consumption. In determining the procurement prices for the forthcoming season the Government would no doubt take note of the observation of FAI.

The extreme disparity in the share of fertiliser consump tion that exists between the different zones of the countr obviously calls for some consideration. During 1980-81 th share of the different zones was as follows : South 27.2 pe cent, Central 26.7 per cent, North 18.5 per cent, West 14 7 pe cent, East 10.4 per cent and plantations 2.5 per cent. A revie made by FAI of the zonewise performance over the five yea period ending 1980-81 disclosed that while the north and wes zones recorded a positive rate of growth through all the fiv years, south, central and east zones recorded a negative rat of growth.

Subsidy for jute goods exports

THE reported decision of the Government to restore cash subsidies to jute goods exports has not come a day too soon. It was overdue; the new cash compensatory scheme fixes a subsidy of 7.5 per cent for carpetbacking, five per cent for sacking if exported through the State Trading Corporation on the basis of global tenders, 7.5 per cent for Australian woolpacks, 10 per cent for decorative fabrics, 7.5 per cent for yarn and twine and 12.6 per cent for cotton bagging. There is no mention of hessian, presumably the quantum of subsidy in its case has not been decided yet, but press reports say, a decision on this will be taken soon. Not knowing the full details of the cash compensatory scheme the industry has not commented as to the adequacy or inadequacy of it. In any case, it is after a bigger and more comprehensive type of support for which the chairman of the Indian Jute Mills Association has been pleading since long.

Judging from the press conference which he has just held in New Delhi, the IJMA chairman is basically after a heavy dose of subsidy and a cut in output at the same time. The present trend of production and stock accumulation, according to him, shows a definite picture of surplus against demand. In concrete terms, the industry expects an output of 1.425 million tonnes during 1980-82 and another extra production of 25,000 tonnes to result from new capacity and introduction of secondhand machinery in several mills. As against this high level of output, the domestic demand is estimated at 900,000 tonnes, leaving a balance of 550,000 tonnes to be exported. The most that the industry expects to sell overseas during the current financial year is 450,000 tonnes, still leaving a surplus of 100,000 tonnes which would push up the stocks to 250.000 tonnes by March 1982. A financially debilitated industry like jute cannot simply afford to carry stocks of such magnitude unless the Government decides to build a jute goods buffer stock, or the move for an orderly international marketing of jute goods is successfully revived. In the absence of any of these positive developments, the industry will not be able to carry such huge stocks for long and mills will be forced to close or curtail their operations under severe financial strain. The IJMA chairman has, therefore, urged the Government to permit a 15 per cent reduction in output straightway so that the possibility of a terribly burdensome surplus emerging eventually can be avoided in due time.

Many may see a kind of pressure tactics in the move to cut output by 15 per cent, but there can be no serious doubt that on the basis of current raw jute prices and other inpu costs, the prices available to the industry in the foreign market must lead to losses. Whether it is as heavy as Rs 12 crores month is by no means conclusively established no matter wha the Indian Jute Mills Association may say, but clearly the dos pressures on the industry have been tremendous while th prices in the market have been rather sticky at levels that d not look remunerative. Something has to be done to end th present state of unsatisfactory affairs, if for no other reaso than that the survival of thousands of jute growing familie depends on the survival of this industry and that the countr needs every rupee of foreign exchange that jute goods earn.

New Delhi has calculated that because of the cash incentive just announced for jute goods exports, the export income wil go up to Rs 400 crores during 1981-82 as against Rs 327.4 crores in 1980-81 and Rs 334.57 crores in 1979-80. In tha case, the reintroduction of the cash compensatory scheme fo jute goods exports will have fully justified itself. But the industry apparently considers these to be a short-term relie only; and, therefore, is asking for more. It wants an immediate order of 100,000 B-twill bags from the Directorate Genera of Supplies and Disposals and also an official directive to the cement industry that it can only use 100 per cent jute bags for packing and not any substitute. Above all, it wants a permanent fund to subsidise exports by imposing a cess, if necessary, on internal sales.

According to reports, the Commerce Ministry considers these demands reasonable and a move is being made to meet the industry's demand to the extent possible. In fact the DGSD has already been asked to purchase 100,000 tonnes of B-twills immediately, and the Finance Ministry has been moved to consider the cess proposal. There is, however, a taxpayer's point of view which the Government ought to consider. How long will it be necessary to subsidise jute exports from the public exchequer ? When will the industry be able to stand on its own feet and compete on equal terms with Bangladesh and synthetics? A bill to constitute a jute board to look after the industry's modernisation and development in the short as well as long term was promised for the monsoon session. There is no sign of that legislation coming along yet.

Paper: Surplus through imports?

GOING by the statistics available from the Indian Paper Makers' Association, the output of paper has been increasing steadily. Last year, it was one million tonnes against a rated capacity of 1.6 million tonnes. During 1981-82, the capacity utilisation is likely to be higher, around 70 per cent, so an output of 1.1 million tonnes is to be expected. If the improved supply of input can be sustained, output should go on increasing. By 1984-85 when the installed capacity is likely to have moved up to at least 2.3 million tonnes, output should be substantially in excess of the 1.5 million tonnes of paper that the country is likely to require then. Thus there would emerge a surplus which the country will have to export to maintain paper prices at the economic level within the country. In fact, there is already the need for exporting some varieties of writing and printing paper due to an excess supply situation at home resulting from a policy of large-scale imports followed over the last three years.

The Indian Paper Makers' Association has complained that despite a substantial increase in domestic output, the State Trading Corporation continues to import paper. During April-June last, 30,000 tonnes of paper of a value of Rs 20 crores has been contracted. During July-August, 10,000 tonnes of paper are likely to come in, at a cost of over Rs 7 crores. Moreover, the public sector Hindustan Paper Corporation has got foreign exchange sanctioned to import 56,000 tonnes for sale in the domestic market, obviously at a heavy foreign exchange cost which may run into Rs 60 crores or so. The association has been urging the Government to stop imports due to an improved supply situation in the domestic market. The industry can raise output by an additional 10 per cent per year, which means an extra output of 1.5 lakh to 2 lakh tonnes. The case for stopping imports is quite strong. On the other hand, measures to help sustain a rising tempo of output should be taken. These should include exports on a long-term basis. There is a readymade market for the cultural varieties of paper in West Asia and South-East Asian countries, and that should be exploited.

At the same time, the Government may have to review the price of white printing paper which was raised to Rs 3,500 per tonne last November taking the cost of inputs prevailing in August 1980 as the basis. The cost has since further gone up, it is claimed by Rs 2,000 per tonne. Such has been the explosion in the cost of inputs.

Finally, with the projected growth of the industry over the next decades due attention should be given to the raw material problem. The raw material problem has already become a constraint and would become increasingly so as more and more paper capacity gets established. Assuming an annual growth rate of 5 per cent in the rated capacity, the total installed capacity of the industry by 2000 AD would be 4.250 million tonnes, corresponding to which the raw material requirement (forest produce and secondary fibres) would have gone up to 12.75 million tonnes. Since availability of bamboo by then cannot exceed four million tonnes per year, the bulk of the raw material has to come from mixed hardwoods as well as from agricultural residues such as cereal straw, bagasse, etc.

Bonds again?

THERE is speculation again whether the special bearer bonds issued in February to unearth black money will be reissued now that the Supreme Court has upheld the constitutional validity of the scheme. By a majority of four to one, the court held that neither the ordinance nor the Act made earlier this year was violative of Article 14 of the constitution and that the ordinance was not outside the ordinance-making powers of the President. However, neither the majority of four judges, led by the chief justice Mr Y. V. Chandrachud nor the dissenting judge, Mr A. C. Gupta, had given reasons for their findings at the time of writing. In such circumstances it is difficult to understand the implications and merits of the judgement but the Union Finance Minister, Mr R. Venkataraman, had strongly defended the scheme in Parliament and outside and this has made the market circles feel that the Government would either come out with a new scheme or reissue special bonds after modifying, if necessary, the terms in the light of the Supreme Court verdict. When the scheme was closed it had fetched the exchequer Rs 384 crores against the budget estimates of Rs 1,000 crores — Rs 200 crores during 1980-81 and Rs 800 crores for the current year. The finances of the Central Government are under strain and it would not be strange if the Government feels inclined to reissue the bonds to reduce the budgetary gap in order to check inflationary pressure.

If, however, the Government thus reissues the bonds, it will lay itself again open to the criticism that was levelled against it at the time of the issue of special bearer bonds. It should not ignore that, apart from the bearer bonds actually putting a premium on tax evasion and seeking to give respectability to black money barons, the scheme has been held at least by one judge of the Supreme Court as violative of Article 14 of the constitution and thus invalid. There are also doubts whether the reissue of the bonds would meet with a response sufficiently to make good the shortfall of Rs 615 crores in the Finance Minister's estimates. It has been pointed out before that the special bearer bonds carrying an implicit rate of 1½ per cent per annum would not be sufficiently attractive to those engaged in black money economy. For black money is not idle liquidity money but circulating money that is found to earn high yields, nearly twice or thrice of that of white money. The voluntary disclosure schemes and now the special bearer bonds scheme have shown that they are not an adequate mechanism to control black money. If at all, such schemes have encouraged hoarders to make more of black money in the safe knowledge that the Government will come forward with yet another scheme of concessions to those who should have been dealt with harshly by law. There is no half-way and coming to terms with black money hoarders will only accentuate the evil that the Government claims to fight and is yet to prove that it really means business.

LETTER FROM COLOMBO

Slower growth of economy

DALTON DE SILVA

THE Sri Lanka economy in 1981 is expected to grow somewhat at a slower pace of about 5 to 6 per cent than the average for the years 1977, when the present Government assumed office, to 1980.

This is the assessment made by Dr Warnasena Rasaputram, Governor of the Central Bank of Ceylon.

In 1980, Sri Lanka's gross national product (GNP) at a constant (1970) prices was estimated at 5.5 per cent. This was less than the high growth rates of 8.2 per cent in 1978 and 6.2 per cent in 1979. The decline in growth in 1980 was attributed mainly to the poor performance of the plantation sector.

In a public address on the economic outlook for Sri Lanka, under the auspices of the Ceylon Chamber of Commerce recently, Dr Rasaputram said though tea production increased by 15 per cent in the first five months of 1981 compared to the corresponding period of 1980, there was a drop of 10 per cent in rubber, 3 per cent in coconut and 13 per cent in industrial production of public sector corporations.

He said favourable developments arising out of the adjustment policies adopted by the Government had resulted in a decline of money supply by 3 per cent in the first five months of 1981, a deceleration of the rate of increase in consumer prices to 9.6 per cent in the first half of the year, lower decline in external reserves and a reduction of the budget deficit.

Value of Sri Lanka exports was expected to rise by 31 per cent in 1981 while the value of the expected rise in imports was around 23 per cent. But in value terms, he said, the deficit in the balance of payments would widen further by 10 per cent over the previous year.

The Central Bank Governor said the ratio of export value which was 52 per cent of imports in 1980 was expected to improve to 54 per cent in 1981. The ultimate result would be that the rate of decline in reserves would be slowed down but this was not significant enough. The rupee value of exports in the first four months of 1981 compared to the same period of 1980 showed an increase of 13 per cent while those of imports rose by 6 per cent and there was an increase in the ratio of exports to imports from 47 per cent in 1980 to 50 per cent in 1981.

He said the overall effect was that the expected reduction in the balance of payments deficit from 19 per cent to 16 per cent of GDP would be realised in 1981. But the adjustment of the economy to favour a faster rate of growth required substantial reduction of this deficit to less than 5 per cent of GDP in the years ahead.

Despite these favourable developments imbalances still remained and were still very large. If the economy was to remain viable an appreciable and a marked reduction of these deficits was a pre-requisite.

Dr Rasaputram said investment activity had been increasing over the last three years and would continue to grow in 1981. The rate of investment in 1981 was placed at 29 per cent of GDP but the total resources available for maintaining this tempo of activity fell far short of the investment demand. Domestic savings which comprised 14 per cent of GDP in 1980 was not expected to rise appreciably. Inward remittances from Sri Lankans living abroad which accounted for Rs 1,600 million in 1980 were likely to rise above Rs 2,000 million thus adding to the total level of resources available for investment. However, there was a large savings—investment gap which had to be met from foreign sources.

He said investment activity in the private sector was beginning to show signs of decline over the peak level of 17 per cent of GDP reached in 1980. A survey of private planned investment conducted by the Central Bank had indicated that planned investment in 1981-82 would be around 70 per cent of total investment for the year 1980-81. In 1980-81 nearly 50 per cent of the planned investment was in machinery and equipment but this ratio was expected to decline sharply to 38 per cent in 1980-81.

Dr Rasaputram said that public sector investment programmes had also been pruned down in 1981 to contain such investment within available financial resources. Stimulus to growth had to come from investment but it should not be at the cost of creating massive imbalances in the economy leading to a high rate of inflation, he said. When there were such contraints to development as lack of skilled manpower, managerial and technical skills and scarcity of capital any attempt to force the pace of investment beyond tolerable upper limits would result in inflation and produce inflationary expectations. A determined effort to combat inflation required the deployment of all available measures effectively and in a timely manner.

The Governor said uncertainties that were widespread today tended to hamper economic growth in general and the decision-making capacity of the business community in particular. Uncertainties in monetary measures would cause greater hardships than most other uncertain variables. Thus there was always a case for medium term monetary targets to reduce that kind of uncertainty. In the absence of targets the business community and agents in various financial and other markets were likely to indulge in intelligent guesses—not necessarily well informed ones—based on forecasts of money supply and of prices, on ministerial hints and reactions to past economic events.

He said it was with this objective of creating less monetary uncertainty and consequently less disturbances that the Central Bank had initiated a process of building up a credit budget based on supply and demand for loanable funds. This would enable the Bank to work out the credit gap in each of the sectors or of each business activity to enable the Central Bank decide on the medium term monetary targets.

The Governor said that in 1980, fiscal policy led to a record budget deficit amounting to 21 per cent of GDP. Now the direction of fiscal policy had been changed. The overall deficit in the 1981 budget estimates was expected to be in the region of 15 per cent of GDP.

Dr Rasaputram said it could be safely assumed that the outlook for the immediate future in the three principal areas of concern—growth, inflation and balance of payments imbalances—were for improvement though inflation and imbalances may not show desired results for a few more years.

SPECIAL ARTICLE

INDO-SOVIET RELATIONS

Expanding economic ties

By VICTOR L. KORNEEV

THE significance of the Treaty of Peace, Friendship and Co-operation between India and the Soviet Union, signed on August 9, 1971, has by no means lessened even though the treaty is a decade old. The Treaty which was initiated during the troublesome days in South Asia, in fact, has attained even greater significance during the last few years and especially nowadays. I shall not deal, however, with the political relevance of the Treaty in the present circumstances. For me, as an economist closely associated with India and moreover with Indo-Soviet economic co-operation during last decade, more important is to share with my Indian colleagues some thoughts on the development of Indo-Soviet co-operation during the span of last decade and its importance in the everyday life of ordinary people of both the countries.

It takes about seven hours to cover (non-stop) the distance between Moscow and New Delhi. These days the climate has somehow played tricks with the weather. So it was 35°C when I left Moscow for India and 25°C when our plane after having penetrated the cloudy Palam skies had landed on the Indian soil. During the last four years while I was dealing with matters of Indo-Soviet economic co-operation from Moscow, many changes have taken place in all spheres of life in India. But relations between India and the Soviet Union seem to be unaffected by all storms of the ocean of Indian politics. The ties between the two countries have grown from strength to strength. India has always been and is now considered by the man in the street in the USSR as a great country populated by friends.

As for Indians, I can judge from my own experience in different places of this country. During the last decade the friendship between our countries has been cemented by bonds of expanding economic ties. Regular exchanges of official visits, the signing of agreements of economic co-operation by the President, Mr L. I. Brezhnev, and the Prime Minister, Mrs Indira Gandhi, in November 1973 and December 1980, the working out of the unique Long-Term Programme of Economic, Trade and Scientific Co-operation, signed in March, 1979, represent basic milestones in the continuous upward development of Indo-Soviet co-operation. The volume of our trade has so enormously increased that you can visit hardly any Moscow shop without purchasing goods of Indian origin.

According to official Soviet statistics India met during 1976-80, 80 per cent

India's trade with Soviet Union: 1951-52 to 1979-80

(Rs crores)

Year	India's exports to USSR	Percentage increase over the previous year/period	India's imports from USSR	Percentage increase over the previous year/period	India's trade balance with USSR

Commerce Research Bureau.

Dr Korneev is attached to the Office of the Counseller for Economic Affairs, USSR Embassy, New Delhi.

Goods for export from India to USSR during 1981

Serial No.	Commodity
	I. Agricultural products
1.	Tea, including packaged tea.
2.	Coffee.
3.	Instant Coffee.
4.	Pepper, black.
5.	Cardamon.
6.	Other spices.
7.	Cashew kernels including consumer packs.
8.	HPS Groundnuts.
9.	De-oiled groundnut cakes.
10.	Other de-oiled cakes.
11.	Tobacco.
12.	Cigarettes.
13.	Shellac.
14.	Fruit juices.
15.	Fresh and canned fruits.
16.	Fresh and dehydrated vegetables, including cotton and garlic.
17.	Anato seeds.
18.	Marine products.
19.	Cut flowers.
	II. Minerals and Ores
20.	Mica.
21.	Mica Products.
22.	Alumina.
23.	Barytes.
24.	Pig Iron.
	III. Chemicals and allied products
25.	Medicine and Pharmaceutical preparations.
26.	Raw materials for production of medicines.
27.	Paints, enamels and varnishes including marine paints.
28.	Lemon Chrome.
29.	Dye-stuffs and intermediates.
30.	Castor oil.
31.	Essential oils : (*a*) Sandalwood oil. (*b*) Other essential oils.
32.	Detergents, scouring powder and other cleaning agents.
33.	Cosmetic goods.
34.	Tyres.
35.	Linoleum.
36.	Surgical gloves.
37.	Vacuum flasks and refills.
38.	Wire enamel (lac "Terebac").
39.	Raw Opium.
40.	Brushes, all types.
41.	Bristles.
	IV. Leather and Leather manufactures
42.	Goat skins, semi-tanned and tanned.
43.	Finished leather.
44.	Leather shoes
45.	Shoe uppers.
46.	Chappals.
47.	Leather haberdashery, including gloves, garments belts, etc.
	V. Textiles
48.	Printed cotton cloth and other cotton piecegoods.
49.	Industrial fabrics.
50.	Paper maker felts.
51.	Bed linen, towels and handkerchiefs.
52.	Cotton sewing thread.
53.	Readymade garments.
54.	Manufactures of handloom.
55.	Cotton hosiery.
56.	Woollen knitwear.
57.	Woollen carpets, hand and machine made.
58.	Jute bags.
59.	Jute cloth.
60.	Raw jute.
61.	Coir manufactures.
62.	Coir yarn.
	VI. Engineering Goods
63.	Automobiles/Storage batteries, traction and other batteries.
64.	Garage equipment including spray booths, petrol, dispensing equipment and others.
65.	Hand tools, pneumatic tools and tool kits.
66.	Aluminium power cables.
67.	Dry core cables.
68.	Dry batteries.
69.	Polygraphic equipment.
70.	Steam boilers, including coil type, thermo-block incinerators, etc.
71.	Electric Instruments, Components and equipment.
72.	Computer software.
73.	Sanitary ware, sanitary fittings and pipes and fittings thereof.
74.	Machinery and equipment manufactured at industrial enterprises built in India with the assistance of USSR.
75.	Textile Machinery.
76.	Automobile ancillaries.
77.	V Belts.
78.	Wire ropes.
79.	Machine tools.
80.	Rolled steel products.
81.	Line pipes (ERU) and spirally welded.
82.	Iron and steel castings and forgings.
83.	Fork lift trucks.
84.	Freight containers.
85.	Electric motors up to 100 KW.
86.	Industrial valves.
	VII. Other items
87.	Wood veneers of tropical wood.
88.	Spectacle frames.
89.	Handicrafts, including manufactures of brass, white metal, semi-precious stones, wood, ivory, etc.
90.	Monkeys.
91.	Sports goods.
92.	Glazed tiles.
93.	Fire hoses.
94.	Books, periodicals, postal stamps, gramophone records and cassets
95.	Miscellaneous goods.

of USSR's tea requirements, 50 per cent of coffee, 100 per cent of cashew nuts, 25 per cent of tobacco, 83 per cent of jute and 92 per cent of jute bags. A tin of Darjeeling tea is really a hot-cake in Moscow. The majority of Moscovites wear Ludhiana sweaters during winter colds, use Indian detergents, toilet soaps, toothpaste, shampoo and other consumer goods in their everyday life. A special shop "Ganga" in Moscow is being frequented by hundreds of people every day. Business people and experts travel in such vast numbers between our two capitals that it is advisable to book your air ticket at least two months in advance.

Thousands of Soviet engineers and workers have been associated in their lives with India, where they have worked or are working at the numerous projects of Indo-Soviet economic co-operation—steel plants at Bokaro and Bhilai, engineering plants at Hardwar, Ranchi and Durgapur, oil refinery at Mathura, Calcutta Metro Construction etc. The fees for their vast experience are uncomparably lower than those paid to the similar western experts, but the willingness to help in training their Indian colleagues is sometimes boundless. The statistical data give an appropriate picture in this respect: More than 120,000 Indian engineers and qualified workers have completed training with the assistance of Soviet specialists both in India and the USSR. Out of them 65,000 were trained during the last decade. It must be noted that to send a qualified Soviet specialist to India is not a simple matter if you take into consideration the relative scarcity of labour, especially skilled labour, in the growing Soviet economy.

Goods for export from the USSR to India during 1981

Serial No.	Commodity
	I. Machinery equipment and spare parts.
1.	Machine tools and metal working equipment welding equipment, scraps bricqueting presses.
2.	Mining, prospecting oil drilling, petrological and survey equipments and instruments and spare parts.
3.	Construction and earth moving equipment and spare parts.
4.	Power and electro-technical equipment turbines, generators and spare parts.
5.	Agricultural machinery, harvesting combines spare parts, including tyres for tractors and equipment and spares for mechanised farms.
6.	Textile machinery and equipment.
7.	Printing machinery and equipment including roto-print machines.
8.	Cinematographic and studio equipment.
9.	Air transportation means including helicopters other equipment and spare parts.
10.	Trucks and spare parts.
11.	Sea and river ships, dredgers, and marine engines and other equipment, including tankers, cargo ships and spare parts.
12.	Components equipment and raw materials for manufacturing programmes of projects of Indo-Soviet Co-operation (completed under construction) and replacement equipment for the projects.
13.	Spare parts to the equipment delivered for projects built with Soviet assistance.
14.	Steel mill rolls.
15.	Ball and roller bearings.
16.	Gas cylinders.
17.	Abrasive goods metal cutting and measuring tools, universal assembling fixtures and steel die blocks.
18.	Laboratory, testing equipment, control measuring and optical instruments, scientific apparatus and metal testing machinery (including requirements of "Instrumentation Limited" Kota).
19.	Medical and veterinary equipment and instruments including dental equipments.
20.	Electronic instruments, computors data processing instruments including tele-communication equipment, professional equipment and components and raw materials for electronic industry.
21.	Other machinery and equipment including transport, lifting and handling equipment rolling equipment, equipment for chemical, food processing meat processing plants, grain storage and handling equipment and grain storage equipment and equipment for rubber industry, equipment for vacuum flask, manufacturing crushing, grinding and dressing equipment pumps, compressors and spare parts for Soviet machinery and equipment supplied to India.
	II. Crude Oil and Petroleum
22.	Crude oil.
23.	Petroleum products (Kerosene and diesel oil).
24.	Oil and lubricants.
	III. Fertilisers.
25.	Urea.
26.	Muriate of Potash (60 per cent K_2O).
27.	Ammonium Sulphate.
	IV. Chemical and Pharmaceutical products
28.	Chemical, including laboratory reagents.
29.	DDT (75 per cent).
30.	Sulphur.
31.	Drugs, pharmaceuticals, raw materials and intermediates required for their production.
	V. Steel products
32.	Rolled Steel products.
	VI. Non-Ferrous Metal
33.	Zinc.
34.	Nickel.
35.	Platinum.
36.	Palladium.
	VII. Other products
37.	Cotton.
38.	Asbestos.
39.	Cement (in bulk).
40.	Refractories.
41.	Newsprint.
42.	Wood pulp.
43.	Pedigree sheep and other animals.
44.	Books, periodicals, postal stamps, gramophone records and cassettes.
45.	Miscellaneous goods.

Unemployment in the USSR was ended in 1936.

A distinctive feature of Soviet assistance to India (which sometimes gives heavy headaches to my colleagues) is an unwritten obligation to help the enterprises built in this country within its framework during the difficult periods of their operation. A recent example is Heavy Engineering plant at Ranchi and MAMC plant at Durgapur which were facing during the last few years depleting order book. To help these plants to overcome the difficulties it was decided to place sizable Soviet orders with them for the supply of machinery and equipment.

It is rightly pointed out by observers that the volume of loans extended by the USSR to India is modest as compared to the huge injections of western aid. Thus during last decade the aid authorised by the USSR to India totalled Rs 641 crores or 5.8 per cent of the total foreign aid during this period. But any unbiased writer ought to bear in mind some fundamental difference in the nature of these aids. First, it concerns the origin of loans. While western governments are in the position to utilise the tax payers' money to help exporters during the difficult periods of world economic recession, the USSR while developing its economy does not have any idle stocks of machinery and equipment. Secondly, the Soviet loans as well as Soviet assistance to India as a whole are directed to the most needy sectors of the Indian economy in which projects of national importance are implemented. During 60s and 70s these were metallurgical and heavy engineering plants; now-a-days at the time of energy crisis the Soviet assistance is directed towards the development of power industry as it can be seen from the provisions of the agreement on economic and technical co-operation signed on December 10, 1980 by the leaders of our two countries.

What is the aim of Soviet economic assistance to India? The answer is obvious to any researcher. The USSR wants to help strengthen the economy of India for the benefit of peace and stability in this important part of the world. This may sound a somewhat stilted statement but I can express it in no other way and it is good to remember this while discussing the historical relevance of the Treaty of Peace, Friendship and Co-operation signed a decade ago.

COVER STORY

Debentures: Key to innovative resource mobilisation

By D. P. PANDEY

DEBENTURES, being a loan contract, are one of the usual forms of resource mobilisation by companies. But, what makes this type of borrowing important now is the recent spurt in the issue of debentures due to its inherent advantages both for the issuing company and the investor. The fact that the total debentures issued during the first half of 1980 amounted to Rs 26.7 crores representing 41.1 per cent of the total capital mobilised as against Rs 14.2 crores during the comparable period of the preceeding year brings into focus the emergence of debentures as a popular medium for attracting investments. (One press report last week has it that the public response to convertible debenture issues of the corporate sector is so good in recent months that the Government now expects the current financial year to end with Rs 400 crores of capital raised against issues approved by the Controller of Capital Issues.) However, until recently, public response to debentures was very poor due to a low yield. Only major financial institutions, *viz* UTI, LIC and GIC were major subscribers. It amounted to transfer of funds from the public financial institutions to the corporate sector.

Raising long term capital through debentures is very attractive for companies as it does not dilute control which happens in the case of shares and institutional borrowings with mandatory convertibility clause. Servicing of debentures being tax deductible reduce the after-tax cost by half, while the same does not apply in case of ordinary and preference shares. Debentures are cheapest source of funds as compared with other forms of borrowing. The present ceiling interest rate on debentures is below the rates currently payable on public deposits or short term bank borrowing.

Mode of issue

The mode of issue of debentures is identical to the release of shares through prospectus. Though there is a provision for the payment of the amount in instalments, generally it is paid in a lumpsum. The debenture holder, unlike the share holder, is not treated as an owner, but a creditor of the company as the debenture is an evidence of debt to the holder. According to the Company Act, debenture includes debenture stock, bonds and any other securities of a company whether constituting a charge on the assets of the company or not.

The issue of debentures which can be either through rights or prospectus has to be cleared by Controller of Capital Issues (CCI). MRTP regulations stipulate that debt should not exceed 50 per cent of the net block of the company, while CCI puts the condition that debt-equity ratio should be generally below 2:1 at the time of issue, debt being defined to include the borrowings, as also proposed issue repayable not earlier than five years from the date of borrowings and preference shares redeemable within 12 years.

Rights debentures issued for raising long term working capital finance are subject to certain guidelines prescribed by CCI in 1978. Besides there being a ceiling on interest rate, their use can be made only for working capital finance but not for additions to fixed assets. The issue cannot exceed 20 per cent of paid up shares and free reserves, or the working capital gap defined to include gross current assets, loans and advances less long-term working capital funds, whichever is lower. The total value of the debenture issue is subject to a maximum of Rs 2.5 crores, though relaxed by CCI in practice. Further, debt-equity ratio cannot exceed one, including the proposed issue.

These, guidelines have been modified extensively in 1980 and made applicable to the issue of secured debentures by public limited companies whose shares are listed on stock exchanges, for the purpose of financing expansion and diversification as also working capital needs. The debt-equity ceiling has been raised to 2:1 with further relaxation possible for capital intensive projects in industries like, fertiliser, petro-chemicals, cement, paper, shipping etc. The stipulations that the debenture issue cannot exceed the working capital gap has also been dropped.

Four categories

There are four categories of debentures, *viz*, registered, secured and unsecured, redeemable and convertible, each having relevance to particular business and environment. The registered debentures are those which are registered in the names of the holders and such names are preserved in the books of the company. Interest is payable to the registered holder or as authorised by him. A company may release debentures payable to the bearer and for such bearer debentures, no register of holders is maintained. They are transferrable by delivery of the debentures to the transferee. But such bearer bonds when secured should be entered in the register of charges. Debentures which carry charge on some assets or property of the company are treated to be secured while debentures which do not carry any charge on assets of the company are deemed to be unsecured.

Debentures, in general, are redeemable. The principal money, in case of such debentures is paid to the investor on the expiry of the fixed term. Debentures may be redeemed either at the issue price or at a higher price and they can be re-issued by the company. Non-redeemable debentures, on the other hand, are issued without any fixed date for redemption and therefore, such debentures are payable only in extreme circumstances, like winding up of the company. The creditor cannot force the company to repay immediately.

Most popular

The most popular form of debentures widely circulated by companies is the convertible ones. A major advantage of this is that they possess a fixed maturity date and they earn a fixed interest annually. Further, they can be converted into ordinary shares of the issuing company under specified terms and conditions. The period during which the investor can exercise his option for exchanging debentures for share is determined by the terms and conditions which vary from one company to another. Convertible debentures which can be issued to finance capital expenditure provide an effective means of raising long term fin-

COVER STORY

ance, especially for companies embarking on major expansion. These debentures stipulate low conversion price relative to the prevailing market price for the shares. Consequently, this attractiveness is based on fairly definite prospect of capital gains on the convertible component at the time of conversion.

Both companies and investors find convertible debentures advantageous. For the companies conversion facilitates extinction of the funded debt through transforming it into equity. Conversion provides flexibility to the capital base of the company and makes mobilisation of funds at a lower cost. Conversion also narrows down the loan capital of the company besides widening the share structure. In such an event, the company normally faces an accommodative market.

The recent enthusiasm among investors in subscribing to convertible debentures can be traced to the many advantages they offer to the subscriber. High return, minimum risk, safety of principal as well as interest attracts the investors. They prefer convertible debentures because of right for equity shares, anticipation of increased dividends, higher opportunity benefits due to realisation of appreciation earlier rather than to wait till the maturity and income tax exemptions of the dividend received upto Rs 3,000 under section 80L of IT Act. The interest on debentures, on the other hand, is taxable.

Benefits of convertible debentures as against non-convertible ones may be better illustrated by an example. Suppose a person purchases 100 units each of Rs 100 convertible and non-convertible debentures. Investments will total to Rs 10,000 bearing rate of interest of 13.5 per cent in both cases. We further assume that in the third year ¼th of the investments in case of convertible debentures, are converted at par in equity and loan repayment starts, in both cases, in the 8th year. Income earned in both cases is as is shown in Table 1.

Total gains on interest earnings, dividend earnings, say, at the rate of 10 per cent, appreciation in converted share value, say, by Rs 5 per share, is Rs 12,112.50 which is higher by Rs 1,650 as compared to earnings in case of non-convertible debentures. This gain may even be higher if we take into account the tax benefits, bonus shares and the fact that share values will appreciate more than Rs 5 as also higher dividend rates with the level of economic developments, inflation rate and stability attained by companies.

Recent development

Convertible debentures, however, are a recent development in the field of our corporate management. The lead was taken by Standard Mills in 1966. The reception was so encouraging that the company resorted to another public issue of convertible loans in 1971-72. The success recorded by Standard Mills attracted several companies including Metal Box, Bharat Bijlee, National Machinery Manufacturers etc and those also met with good response.

Table I: Gains from debentures

(in Rs)

Year	Convertible Debentures				Non-convertible Debentures
	Interest earned @ 13.5%	Shares/earnings: Unit of Rs 10 each (Nos.)	Shares/earnings: Appreciation in shares (Value)	Shares/earnings: Dividend @ 10%	Interest earned @ 13.5%
1	1,350.00				1,350.00
2	1,350.00				1,350.00
3	1,012.50	250 unit	1,250.00		1,350.00
4	1,012.50	,,		250	1,350.00
5	1,012.50	,,		250	1,350.00
6	1,012.50	,,		250	1,350.00
7	1,012.50	,,		250	1,012.50
8	675.00	,,		250	675.00
9	337.50	,,		250	337.50
10	337.50	,,		250	337.50
Total	9,112.50		1,250.00	1,750	10,462.50

Recently, the debentures issues of Reliance, Tata Engineering, East India Hotels, Indian Rayon etc, turned out to be big success with overflowing subscription. The convertible debenture issue of Rs 0.75 crores to the public by Hindustan Development Corporation was oversubscribed 72 times, the largest extent of oversubscription reported during the year. The convertible debentures issue of Rs 24 crores by Reliance Textile Industries Limited was oversubscribed 8.3 times, involving application money of nearly Rs 60 crores. Similarly, Rs 29.3 crores convertible debenture issue of Tata Engineering and Locomotive Co Ltd was oversubscribed six times, entailing application money of Rs 88 crores.

A company normally goes for the issue of debentures when there is a climate of depression and stagnancy in the capital market. The risk involved in such times is minimum. When there is a boom in the capital market, it would be advantageous for the companies to go for equity issues. Further, companies with a sound economic base and aspiring for further growth would like to build up capital through debentures as it would facilate continued profits to share holders. Another plus point of debentures is that it would not disturb the stability of the company. Only running companies can have the facility of debentures as such debentures are secured by mortage of fixed assets of the issuing company.

Business strategy

Now, using the tool of debentures has come to stay as a major business strategy for improving the capital structure of companies. Available data exhibit the phenomenal growth of debentures in recent times. From a mere total of Rs 4.3 crores in 1971, the debentures issue of non-government, non-financial public limited companies showed a two-fold increase as it moved up to Rs 9.8 crores in 1978 which marked a sudden spurt in the demand for debentures. Again it increased by seven times over 1978 when the total figures touched Rs 66.8 crores in 1979. The first half of the year 1980 also witnessed the uptrend in debentures as the total figures amounted to Rs 26.7 crores as compared to Rs 14.2 crores in comparable period of 1979

Another noticeable feature is the reduction in the gulf between the total amount of debentures

sents/acknowledgement of proposals granted for the same. The total amount of debentures stood at Rs 4.3 crores or 16.9 per cent of the consent/acknowledgements of proposals granted which totalled Rs 25.5 crores during the year 1971. The figure for the year 1978 at Rs 9.8 crores or 20.1 per cent of the consent/acknowledgements of proposals granted at Rs 48.8 crores reflects the narrowing gap between them. The gap is further narrowed in 1979 as debentures issued amounted to Rs 66.8 crores marking 48.1 per cent of the consent/acknowledgements granted at Rs 138.8 crores. The first half of the year 1980 showed that the consents/acknowledgements of proposals granted at Rs 26.6 crores were issued totally and subscribed fully.

During the year 1981-82 an amount of Rs 125 crores is estimated to be raised through debentures of a number of companies. Reliance, Voltas, Indian Aluminium, Straw Products, Shree Dinesh Mills, Ferro Alloys Corporation, Rustom Mills, Shree Vallabh Mills, Fibre Pilkington are some of the companies going in for debentures.

Restrictive credit policy

The anxiety of some of these companies in resorting to debentures can partly be attributed to restrictive credit policies which makes availability of institutional finance difficult. The recent budgetary hike on interest rate ceiling on debentures to 13.5 per cent was chiefly designed to make debentures more attractive. The ceiling interest rate on debentures which was just 7.0 per cent in 1963-64, was raised to 8.0 per cent in 1970-71, to 10.5 per cent in 1974-75, to 11 per cent in 1979-80 and further to 12 per cent in October 1980. Thus the raising of the ceiling on interest rates can be seen as evidence of the government's intention of making companies depend less on financial institutions and move more towards mobilising funds from the population of investors.

The boosted interest rate of 13.5 per cent itself, may not be very attractive to investors as they have wide options before investing their funds. Public deposits accepted by companies offer a maximum of 15 per cent interest though a majority of companies including few public sector organisations offer less than the ceiling limit for a deposit covering three years. Moreover, several companies have defaulted in repayment of deposits with them on maturity. This makes debentures, especially convertible ones, a better medium of investment as they provide for the conversion into equity shares.

Debentures ensure a reasonable return for the financial institutions. These institutions, therefore, in most cases, subscribe to the maximum permitted limit of 60 per cent. Companies have to ensure a minimum subscription of 75 per cent of the total amount to be raised. And, as about 60 per cent is subscribed by financial institutions, the remaining 15 per cent is generally raised from banks, trusts and individual investors.

Table 2 : Debentures of non-government, non-financial public limited companies

(Rs in crores)

Bonds

Bonds which are synonymous with debentures are issued by national and state governments, local and public statutory bodies, such as port trusts, town authorities, municipal corporations, electricity boards and other public sector bodies, promising to return borrowed funds along with the specified interest. These bonds are perpetual and redeemable. The former cannot be redeemed, bears fixd interest and provides for capital gains. The price and yield on such bonds have an adverse relation as to their movement. The latter, on the other hand, are redeemable within a range of dates. The purchaser of these redeemable bonds is concerned with two sets of future payments—annuity over remaining life of the bond and a lumpsum at a stipulated date in future. The degree of risks of both the type of bonds varies according to the issuing authority and size of the particular issue.

The statutory bodies, financial institutions and Government issue these debenture-bonds for financing their developmental projects. These debenture-bonds are generally subscribed by commercial and cooperative banks, Life Insurance Corporation, Unit Trust, charitable trusts, and joint stock companies. Inspite of unduly low interest rates as compared to the prevailing market rate, these debentures (bonds), having captive market, are quite active and popular as they offer safety, liquidity and assured income as also advantages of capital appreciation. Among these bonds, issues by Bombay Municipal Corporation and Industrial Finance Corporation are generally over-subscribed. Preference for these issues comes from stringency in money market and the gradual upward revision of interest rates for the comparable loans.

New dimensions

Thus, debentures have assumed a new dimension. There are indications that the Indian corporate community would resort more and more to this form of augmenting their capital base. Various stock exchanges in India have on their lists some 250 debentures with Bombay and Calcutta stock exchanges representing about three-fourth of the listed debentures.

A study undertaken by Bombay Stock Exchange showed depreciation of the market value of debentures during 1979. The market value of 185 debentures was Rs 479.28 crores as compared to the issue amount of Rs 503.59 crores representing a depreciation of 5 per cent. This may be attributed to various factors

BOOKS & IDEAS

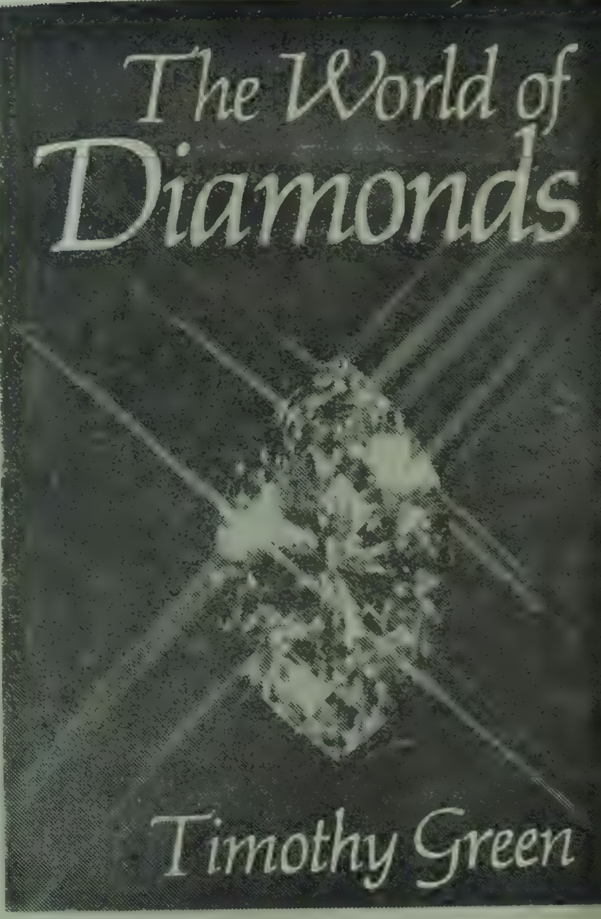
The world of monopoly and illicit trade

TIMOTHY Green is a well known figure in the gold world. As consultant, he helps to bring out the authoritative annual reports on gold of Consolidated Gold Fields Limited. On his visits to India, the Bombay Bullion Association arranges a meeting of its members for Mr Green to address them, and top bureaucrats of the Finance Ministry and Planning Commission listen with respect to his assessment of gold price movements and smuggling of gold into India and silver out of India. An experienced journalist, obviously he developed interest in diamonds along with gold and, as the blurb says, travelled 50,000 miles and visited 15 countries to put together "the first ever inside story of what is a ruthless, secretive and often illicit world."

The earlier editions of *Encyclopaedia Brittanica* devote some space to Indian diamonds of which perhaps the most famous was the 108.93 carat Kohinoor, now forming part of the British crown jewels and which was reportedly owned as far back as 1304 by the Raja of Malwa. At one time, the industry did flourish in India and the French merchant, Jean Baptiste Tavernier, wrote that he found 60,000 workers employed in Kolar group of mines in 1645 and that these mines had been discovered about 100 years previously. But the mining of diamonds in India is more or less extinct and Mr Green's world of diamonds essentially consists of the mining in African countries, the empire of De Beers and Cecil Rhodes, Sir Ernest Oppenheimer and Harry Oppenheimer who helped to build the monopoly of the Central Sales Organisation of De Beers through which 80 to 85 per cent of the world's diamonds are marketed. Even Russia makes use of this organisation to market its diamonds. In fact, it would appear the Soviet Union prefers to leave the marketing of diamonds to the Diamonds Trading Company (DTC), the main arm of De Beers Central Selling Organisation—'the syndicate' to many diamond traders.

India figures is Green's book as an importer of rough diamonds and exporter of polished diamonds. Today, not a single country can rival India in polishing small diamonds and Green records such enterprise has made India a dominant new force in the world of diamonds in the 1970s. She overhauled both Antwerp (Belgium) and Tel Aviv (Israel) in the weight of diamonds imported by her manufacturers. Sixty per cent of all diamonds are now cut and polished in India and Green notes that the resulting finished goods were actually the country's top export earner in 1979, grossing nearly $900 million.

Between them a dozen African countries (Angola), Botswana, Central Africa Republic, Ghana, Guinea, Lesotho, Liberia, Namibia, Sierra Leone, South Africa, Tanzania and Zaire) produce 75 per cent of the world's diamonds. Zaire is, as Green points out, a leader judged in terms of carats (12 to 15 million carats annually) but many of her diamonds are only of industrial quality. The real wealth is in South Africa, Botswana and Namibia who between them produce more than half of all the jewel stones. Remarkably enough it is not only Russia but also the newly independent countries of Angola, Sierra Leone, and Tanzania that rely on South Africa-based De Beers organisation for marketing of their rough diamonds and the trade is a big one. Diamond sales by the CSO came to about $2.5 billion in 1980 and the world trade in polished diamonds is worth over $15 billion. The 17 mines in De Beers group itself still control 90 per cent of South African diamond output and 100 per cent in Namibia, Botswana and Lesotho. The Russian output is conservatively estimated to be over 10 million carats a year (and is more likely to be between 11 and 12 million) making the Soviet Union the world's second largest producer after Zaire but, unlike in Zaire, over a quarter of the Russian output is of high quality gems. Explaining the relationship of De Beers with African producers, an executive of De Beers told Green: "We stride across Africa in a very satisfactory way in all sorts of very strange places. Part of the secret is that we respect confidences. We don't talk much. We have been able to convince governments that the system works, and that it is in their interest and ours that it continues to work."



Published by George Weidenfield & Nicholson Limited, 91, *Clapham High Street, London SW* 4; *Pages* 260; *Price* £7.95.

The diamond desert of Namibia partly explains why South Africa is defying the United Nations and not allowing its hold to loosen on that country. Green points out that though the production of diamond desert has peaked out from 2 million carats down to around 1.6 million, it is a continuing treasure house. "So, the real issue as Namibia gains independence after more than 60 years of dominance by South Africa is who will control De Beers Consolidated Diamond Mines of South-West Africa (CDM). At present, it is 100 per cent owned by De Beers and their lease on the diamond desert expires only in 2010. Well ahead of independence, De Beers astutely transferred CDM's office to the Namibian capital, Windhoek. Clearly, the Namibian government will eye the wealth of CDM whose taxes constitute no less than 50 per cent of that country's revenue, with special attention. Already CDM pays 64 per cent of its mining profits to Namibia. Will the new regime rest content with that? Or like their neighbours in Botswana, will they reduce De Beers' stake in CDM, perhaps opting for a 50 : 50 share? Outright nationalisation is conceivable, especially if the left wing Swapo eventually gains power."

No one tries to deny that De Beers selling organisation is a cartel, but in De Beers' eyes at least it is a benovolent one. Green quotes Harry Oppenheimer as saying: "Whether this measure o control amounts to a monopoly I woul not know. But if it is, it is certainly monopoly of a most unusual kind. Ther whether as a producer, dealer, cutter, developer or customer who does not benefit from it. It produces not only shareholders in the big diamond companies, but also the miners they employ and the communities that are depending on their operations. Well beings of tens of thousands of diamond diggers of all the races is depending on its maintenance."

The best known address of the diamond business is the Diamond Trading Company, 17 Charterhouse Street, London, ECI. Every five weeks, 300 or so of the world's foremost diamond dealers and manufacturers pass through the massive doors, with diamond shaped glass panels, to spend nearly $300 million on rough gem diamonds. Although each has to accept or reject the packet of goods that is waiting for him without any real negotiations on price or content, everyone turns up for this 'convocation', with religious regularity. Green compares the CSO to the sponge that absorbs diamonds in bad times and disgorges them in good. The structure of the diamond business that was originally built up by Sir Ernest Oppenheirmer has, according to him survived for half a century because of the comfortable feeling of stability that it engenders in miners and manufacturer alike. The CSO spends upwards of $40 million annually for just not selling the idea 'a diamond is forever' but also to make sure that if the inventory is laden with a particular size of diamonds, the customer is wooed to buy them. The interesting part is that it is an American advertising agency that handles the diamond campaign in the most lucrative market for gems and diamonds but American anti-trust legislation makes it impossible for the mining house of De Beers, as an effective monopoly in diamonds, to maintain any presence in the United States.

Will this monopoly last? Zaire has already on June 1 withdrawn from De Beers' Central Selling Organisation and subsequently claimed that the prices realised for the first sale of 6,20,000 carats were 37 per cent higher than those offered by De Beers. Its state mineral exporting board, Sozacom, has signed marketing contracts with independent companies. This is reportedly worrying De Beers since Zaire's example may be followed by other African countries. Another source of worry may come from Australia which has reportedly found mines capable of yielding 25 million carats of diamonds annually against the current world production of 50 million carats, and not the least source of concern for De Beers is when Namibia attains freedom. If Zaire's example is followed by Australia and Namibia, Russia could follow in their foot steps and De Beer's monopoly will certainly be then threatened though Harry Oppenheimer is confident that De Beers' dominance in diamond trade will not be challenged.

Green devotes a full chapter to smuggling of diamonds (in diamond circles smuggling is not a popular word and instead they are called 'submarine goods'). The very nature of the goods, Green points out, makes smuggling endemic every step of the way from mine to cutting centre to buyer. The flourishing traffic in rough diamonds, either stolen in the mines themselves or mined illicitly, in Zaire, Angola, Sierra Leone or Brazil involves, he says, at a conservative estimate at least $100 million a year. "Wholesale value of polished goods going into Italy and Spain, for instance, is at least $250 million a year and very little is declared; Hongkong imports close to $700 million worth of diamonds each year, and most depart again by submarine for Japan, South Korea, Thailand, Indonesia and the Phillippines. Even Iran was soaking up $50 million a year in smuggled goods from Antwerp or Bombay until the Ayatollah replaced the Shah. Already that is $1 billion a year without considering North Africa, South America, the United States or Britain", Green comments. Incidentally Green makes a reference to the appearance of Russian polished diamonds in India on the eve of 1980 parliamentary elections which was reported in the *Market Gossip* column in *Commerce* first and was blown up into a full length story by *Onlooker*. He seems to agree that these diamonds were used to finance the elections of some chosen candidates.

Green is so fascinated by the glittering world of diamonds that he somehow or other takes a dislike to the advance of diamonds "as a cure for industrial headaches". The market is expected, he says, to double in the 80s and since natural diamond production cannot keep pace, the real growth will be in synthetics. "Somehow that takes a little of the magic out of diamonds", he laments.

D. B. Mahatme

In brief

Handbook on Project Appraisal & Follow-Up (A Practical Guide)

by D. P. Sarda,

Govind Prakashan, 204 *Saraswati Kunj,* 90, *S. V. Road, Goregaon, Bombay* 400 062; 1981; *Pages* 125; *Price Rs* 15.

Mr Sarda of the Bankers Training College of the Reserve Bank of India has written this book to guide the executives in banks and financial institutions in the techniques of project appraisal and follow-up of the projects financed by the banks and financial institutions. Dr I. G. Patel, Governor, Reserve Bank of India, has written a foreword commending the book.

Taxman's Direct Taxes Law and Practice

by Vinod K. Singhania, Assisted by Jeewan Singhania.

Taxman Publications (P) Ltd, 1871 *Kucha Chelan, Khari Baoli, Delhi* 110 006; 1981; *Pages* XV, 782; *Price Rs* 50.

This book offers a discussion of the laws relating to direct taxation in the country. It is intended for the students of law.

The economy in Parliament

From OUR NEW DELHI BUREAU

Replacing petrol by electronic power

Q. Mr A. T. Patil

Will the Minister of Science and Technology be pleased to state:

(a) whether Government propose to replace petrol and allied sources of energy for motors by electronic power;

(b) if so, the progress, if any, made in that direction; and

(c) the economic and other aspects of this change?

A. Prime Minister, Mrs Indira Gandhi

(a), (b) & (c): A statement is laid on the Table of the House.

Solar photovoltaic cells and panels, which convert sunlight into electricity, have been developed under the research and development programmes of the Department of Science and Technology. These can be used to provide electrical power to run electric motors for a variety of uses, including agricultural pumpsets, thereby replacing the use of diesel. Several demonstration photovoltaic water, pumping units have been installed for field testing and performance evaluation. A pilot plant for production of 1 mw of solar photovoltaic panels by 1985 is being set up to undertake large scale demonstrations.

Photovoltaic panels can also be used to charge the batteries used in battery powered vehicles.

At present, the costs of solar photovoltaic pumpsets and battery powered vehicles are very much higher than conventional alternatives using petrol and diesel. Major efforts are being made to bring down costs and improve efficiency.

Additional heavy water plants

Q. Dr Lokesh Chandra, Dr (Mrs) Nazma Heptulla

Will the Prime Minister be pleased to state:

(a) whether it is a fact that seven additional heavy water plants are being set up to meet the requirements of the nuclear power programme; and

(b) what steps Government have taken to prevent the delays, breakdowns and malfunctioning which affect the heavy water production?

A. Minister of State for S & T, Electronics and Environment, Mr C. P. N. Singh

(a) It is proposed to set up three additional heavy water plants, two based on Ammonia-Hydrogen Exchange (monotherm) process and one based on Hydrogen Sulphide-Water exchange process, in the next phase, to meet the requirements of the nuclear power programme.

(b) Efforts are being made to optimise production at the existing Heavy Water Plants by improvements in the onstreaming procedure, and efficient operation and maintenance. The commissioning activities of the Heavy Water Plants, Kota and Talcher are being expedited to ensure early start up of production. In the light of the experience gained, execution of the new projects are proposed to be expedited. Further, the technical problems encountered in the earlier plants would be overcome by suitable measures.

Using of offshore gas for fertiliser production

Q. Mr Jagdish Tytler

Will the Minister of Petroleum, Chemicals and Fertilisers be pleased to state:

(a) whether it is a fact that the Government are thinking of using the offshore gas for fertiliser production;

(b) if so, whether Government propose to do to implement the recommendations of the Satish Chandra Committee on the utilisation of offshore gas?

A. Minister of Petroleum, Chemical & Fertilisers, Mr P. C. Sethi

(a) The present policy of the Government is that, as far as practicable, gas should be utilised as feedstock for the production of fertilisers, petrochemicals and for extraction of LPG, etc. To the extent the gas cannot be used immediately for these purposes it can be diverted for other purposes such as power generation, etc, purely as a fall-back arrangement on a temporary basis till the fertiliser and petrochemical plants are ready to utilise it fully.

(b) The recommendations have been accepted by the Government and are being implemented.

Import of iron and steel materials

Q. Mr Subodh Sen

Will the Minister of Steel and Mines be pleased to state:

(a) whether Government are planning to import 1.75 lakh tonnes of iron and steel materials during 1981-82;

(b) if so, what would be the price of that steel; and

(c) whether Government propose to allot the entire imported stock to the large scale and medium scale sector and that from domestic sources supplied to the State Small Industries Corporations?

A. Minister of Commerce, Steel and Mines, Mr Pranab Mukherjee

(a) The current import policy provides for import of some categories directly by actual users and some others are canalised. The quantities to be imported are likely to be substantially higher than 1.75 lakh tonnes.

(b) The price would depend on various factors like the category involved, the specification, the time of import, the source of import etc.

(c) No, Sir.

Export to the Soviet Union

Q. Mr Shiv Chandra Jha

Will the Minister of Commerce be pleased to state:

(a) whether it is a fact that the Soviet Union has made an agreement to buy toothpaste, etc, from India;

(b) if so, what are the details thereof?

A. Minister of State in the Ministry of Commerce, Mr Khurshid Alam Khan

(a) & (b): Yes, Sir, The Soviet Union has placed orders on a large number of Indian manufacturers and firms for supply of tooth-paste, cleaning powder, detergents and cosmetics like lipsticks, shaving cream, shampoos, mascara, nail polish etc for supply in 1981 and, in some cases beyond this year. It is understood, that exports of these items worth Rs 55 crores have already been made in 1981.

Indo-Ghana agreement for purchase of rough diamonds

Q. Mr Jagdish Tytler

Will the Minister of Steel and Mines be pleased to state:

(a) whether India and Ghana have entered into a bilateral agreement for the purchase of rough diamonds;

(b) if so, the details, the agreement along with the implications and profitability of the same?

A. Minister of Commerce, Steel and Mines, Mr Pranab Mukherjee

(a) & (b): A trade agreement has been negotiated between Ghana and India during the recent visit of an Indian delegation to that country. As a result of negotiations, Ghana has agreed to supply a certain quantity of rough diamonds directly on regular basis to the MMTC. Details of arrangements and supply are still to be finalised between MMTC and the Diamond Marketing Corporation of Ghana. It is, therefore, premature to asses the profitability of this arrangement.

Cochin as a free trade zone

Q. Prof P. J. Kurien

Will the Minister of Commerce be pleased to state:

(a) whether Government have received any representation to declare Cochin as a free trade zone; and

(b) if so, Government's reaction and the action taken so far?

A. Minister of State in the Ministry of Commerce, Mr Khurshid Alam Khan

(a) & (b): Yes Sir. A proposal had been received from the Government of Kerala to declare Cochin as a free trade zone. But in view of the decision taken by the Government of India in May, 1976 not to set up any more free trade zones in the country, such requests including that of Cochin for setting up free trade zones in the country have not been agreed to.

However, the Government of India have recently announced a 100 per cent export oriented scheme. Such units can be located anywhere in India and will be eligible for duty free imports of capital goods, raw material and component as in the case of units located in the free trade zones.

Debentures: Key to innovative resource mobilisation

Concluded from page 465

that surface the general market valuations. The paid up capital, represented by equity and preference shares (with the exclusion of common shares) of the companies covered by the study amounted to Rs 2,970 crores as at the end of December 1979 while the funds raised through debentures totalled Rs 504 crores, which works out to 17 per cent of the paid-up capital.

With the emergence of debentures as a growing corporate tool for resource mobilisation, there is an urgent need to make this sort of public borrowing more beneficial and result-bearing both for the issuing companies and the banks and the small investors. Though there has been considerable public interest in subscribing to debentures, investors cannot be expected to opt for debentures when there are other modes of profitable investment.

The absence of a secondary market for encashing the debentures prevents many prospective investors from entering into the field of debentures. Again, the differential rates of stamp duties for transfer of debentures unlike for shares is also a minus factor. The success of the new issues of some of the companies is largely due to innovative resource management and clever efforts in identifying areas of investment potential hitherto untapped by those companies.

Secondary market

Secondary market for debentures could not develop due to low return consequent to ceiling on the interest rates which is kept unduly low. Therefore, debentures cannot even be considered more liquid than fixed deposits with commercial banks as the depositor is entitled for borrowing against such deposits by paying a premium of 2 per cent interest. Provision for repurchase by company of debentures upto the full value of Rs 25 lakhs in any accounting year at par value provided total holding of a debenture holder do not exceed Rs 10,000 and the debentures have been held for at least one year, offers part offsetting advantage to this situation. Therefore, the need is to make debentures more attractive by removing the current ceiling on debentures or raising it upwards. Moreover, there appears little justification for keeping a ceiling rate lower than interest available on company deposits or on deposits with commercial banks.

The argument put forward in support of ceiling on debenture interest rates lack force. For example it is argued that the ceiling keeps cost of capital low for long-term investment, but the ceiling denies scope for long-term funds that can be mobilised and thus defeats the very objective of encouraging long-term investment. It is unconvincing that ceiling is necessary to prevent companies from evading RBI credit curbs by using other means of finance as banks can take care of long-term borrowings through public issues. Ceiling is advocated as a means to protect the market for government securities which is again unconvincing as government securities always have a captive market.

Protection of equity market

It is said that ceiling is aimed at protection for the equity market as higher yields on debentures will necessitate higher payment on equities also. But, it cannot be denied that this will serve as a stimulant for the investors and to that extent debentures can emerge as a substitute for short-term borrowing from commercial banks. Raising the ceiling interest rate on debentures, thus, not only will attract public investments but also give a leverage in the hands of RBI to control credit.

Banks, of late, have demonstrated considerable interest in sophisticated means of corporate activities and associated themselves in issue management and allied matters. These institutions have a special role in contributing towards the success of new issues, both convertible and non-convertible, as it will reduce considerably the exclusive dependence of companies on institutional finance. A number of banks are underwriting the issues of non-convertible debentures. Banks, however, cannot block their funds in debentures for a long time, though handling of such issues, places with them a significant amount of funds of a floating nature. The provision of a secondary market, therefore, becomes necessary to enable the banks to convert the debentures into liquid money. Once liquidity is established, the investors will find medium of debentures more rewarding.

Urgent need for Ombudsman

By ARVIND BHANDARI

SINCE the name of Mr Antulay has been reverberating in the chambers of Parliament and embellishing the front pages of newspapers. I can scarcely avoid the reflex action to join the cacophony. For the moment, Mrs Gandhi has been constrained to demonstrate her trust in Mr Antulay despite his trusts, partly because of her inability to completely live down her initial association with the questionable conundrum, partly because of the cynical notion that the party's lustrous image would be dimmed if a hand-picked protege were not to be defended. But, in a sense, Mr Antulay deserves our gratitude because, through his charade of a latter-day Robinhood, he has helped to revive interest in two vital issues. Firstly, excessive controls and over-regulation, foisted on the country in the name of welfarism and distributive justice, have more than a socio-economic angle. It has been the stand of most observers of the economic scene that multiplicity of controls also has a political angle inasmuch as it places in the hands of the politicians in power immense patronage, which can be dispensed for a price, the yield going sometimes into party coffers and sometimes elsewhere. Now Mr Antulay has vindicated this stand, if such a stand ever needed vindication. Axiomatically the apparatus of excessive controls is unlikely to be dismantled because of the vested interest of ruling politicians. Secondly, Mr Antulay has brought to the surface what many of his colleagues seek to keep subtarranean by doing overtly what they seek to do covertly. By a brazen, bare-faced assault on standards of public probity Mr Antulay has again brought to the fore the urgent need to immediately establish an Ombudsman-type institution both at the Centre and in the states which would be completely independent of the executive. A *Lok Pal* at the Centre should be empowered to investigate charges of corruption and abuse of power right from the office of the Prime Minister downwards. A *Lok Ayukt* in the states should have similar powers in respect of the office of the Chief Minister downwards. Some states, including Maharashtra, have had a *Lok Ayukt*, but it has been an impotent institution because of exclusion of the office of Chief Minister from its purview and lack of an independent investigative machinery. It is a measure of the potential effectiveness of the *Lok Pal* institution that none of those who have wielded power in New Delhi have had the guts to establish it, with the result that the proposed legislation on the subject has been rotting for a number of years. Mrs Gandhi first introduced a *Lok Pal* in Parliament during her earlier regime. Mr Morarji Desai improved on the bill by also bringing within its purview the office of Prime Minister, but when it came to the crunch, the Janata Government funked. During her present regime Mrs Gandhi has been so tied up with making her government work that she has apparently no time to even contemplate reformist measures. If Mrs Gandhi even now brings in a *Lok Pal*, she will have won the appreciation of a public whose nostrils are beginning to be unbearably assailed by the stink emanating from the corridors of power. An ounce of practice is equal to at least a tonne of precept.

DATELINE NEW DELHI

Counter-productive

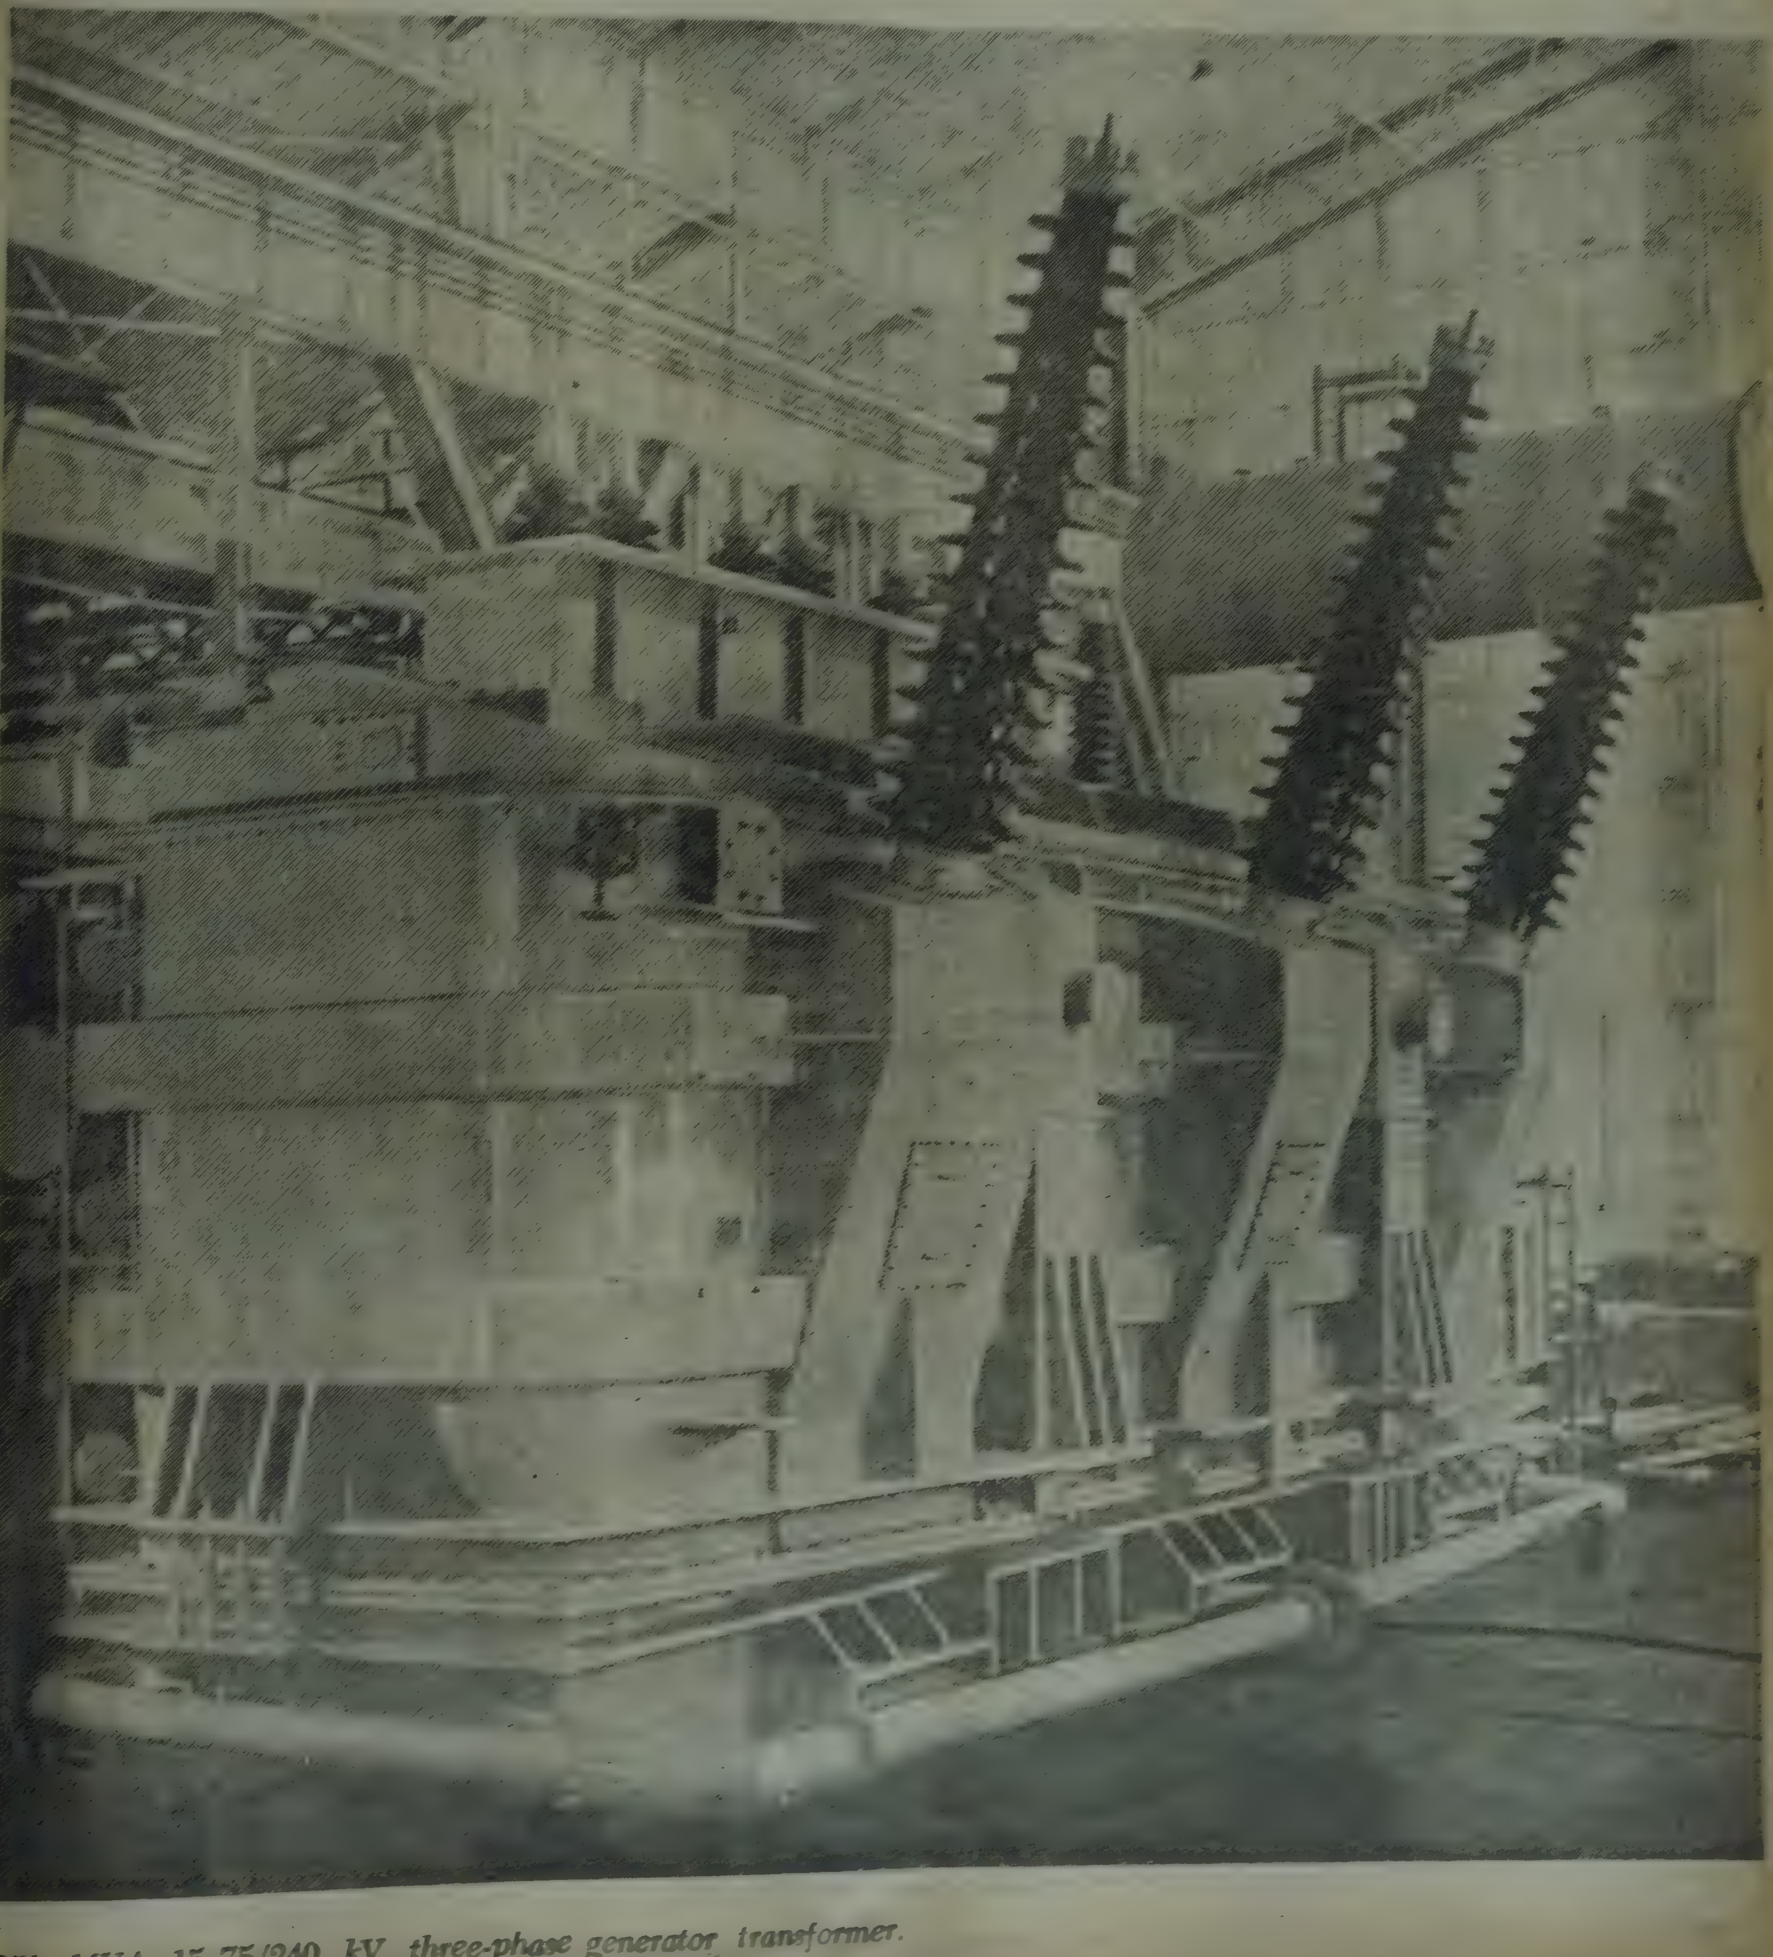
Talking about controls, some of the restrictions placed on the larger houses are plainly counter-productive. One, large houses are not allowed to set up units in the core sector without MRTP clearance, which is such a cumbersome procedure that it acts as an obstacle. In fact, Appendix I of the Industrial Development and Regulation Act restricts the number of industries which large houses can enter to 19. Two, Section 72-A of the Income Tax Act prohibits merger of a sick unit with a healthy unit unless the two are engaged in similar manufacturing activity. Three, MRTP units have to seek prior permission for modernisation if such a proposal results in accretion to value of assets by 25 per cent (the Sachar Committee had suggested relaxation of this provision). Four, FERA companies are discouraged to enter the core sector even when they have diluted their equity to 40 per cent non-resident holding. If the Government does not have the gumption to remove these controls, it should at least relax them. Will it? While sources in the Industry Ministry hint that there is some thinking along these lines, Mrs Gandhi was reported to have told a delegation of young industrialists that controls were necessary in the Indian context (*The Times of India*, September 2). The Prime Minister's remarks may not be taken as a douche of cold water on hopes that this country would still move towards economic pragmatism but they are definitely indicative of a constipated approach when it comes to throwing off the shackles of shibboleths.

More to it

The Thal Vaishet affair would be a typical candidate for being referred by a public-spirited citizen to the *Lok Pal* if one existed. Because of the Government's decision to make a last-minute switch from the selected American consultants, C. F. Braun, to the Danish-Italian consultants, Haldor Topsoe, India has lost a World Bank loan of $ 250 million for what is planned to be one of the biggest urea plants in the world. I have argued earlier also in these columns that the whole deal will continue to appear shady unless the Government chooses to dispel the shade by throwing some light on it. The Government should publish a white paper which would explain in detail why the selected consultants were suddenly changed when the selection had been endorsed not only by the World Bank but also by two separate Indian committees of experts. Such a white paper is all the more called for in view of some revelations in the report view of the Public Undertakings Committee which has been tabled in Parliament. The report says: "The Committee asked (the Secretary, Department of Chemicals and Fertilisers) how the offer of Haldor Topsoe was found to be 'comprehensive and attractive' and whether the committee of Ministers had the advantage of any superior technical advice. All that the witness could say was: 'I can't say superior technical advice; they have gone into what I may say weighty non-technical reasons...' The Cabinet decision merely accepts the recommendation of the committee of Ministers". What are these "weighty non-technical reasons" which weighed with this Government? The people have a right to know."

Progress of electrical industry

—A FEATURE

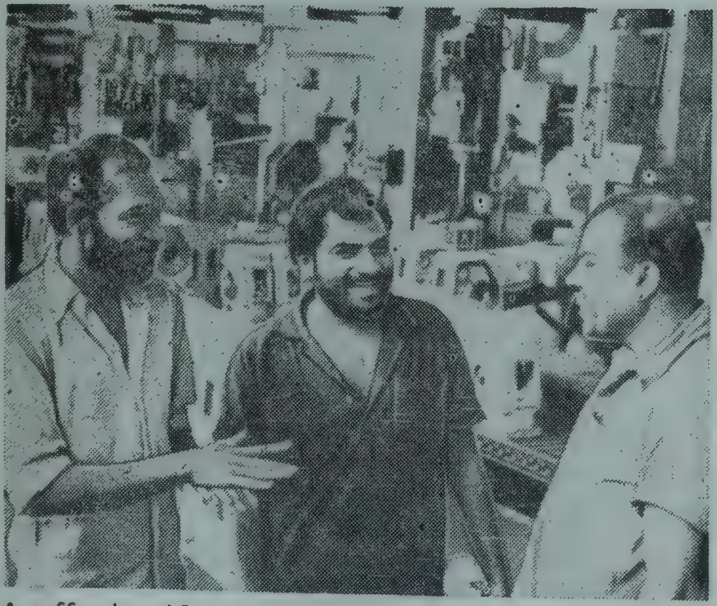


250 MVA 15.75/240 kV three-phase generator transformer.

No extra power cuts
So no gensets, right?
Wrong.

Power Interruptions cause havoc –

About 250 working hours, that's 6% income lost every year.



A coffee break? .. No. It's a power interruption.

Records of a leading engineering company reveal that power interruptions in a single year numbered 236. Resulting in a total time loss of 250 working hours. Fortunately, the company had captive power. Otherwise, it would have suffered production losses worth 5 crore rupees

What's bad is that power interruptions come even if there's no power cut. You're not always given a warning. And, no notice of when power will return again. No time to arrange or rearrange manpower, materials or operations. No one is spared from these power interruptions. There's no knowing how many will occur in a given span of time. Check your past records.

The only solution is to ready yourself beforehand. Today itself won't be too early to do so. Contact Kirloskar Cummins Limited. Its wide range covers all your requirements. Single units up to 1000 KVA. In several places 6000 KVA gensets are operating in parallel.

10,000 KCL gensets operate in India, generating 1,500 MW of power. Join these growing numbers and be safe from the havoc of power interruptions.

KCL gensets ... largest range, lowest total cost.

Mail this coupon to the Project Sales Manager, Kirloskar Cummins Limited, Kothrud, Pune 411 029, for a **worksheet of the economics of KCL gensets.**

Electrical industry : Three decades of progress

By AJIT SHAH

ENERGY plays a vital role in accelerating human progress and economic development. For human progress much depends upon the capacity of the human being to discover and harness the energy available in nature. Among the different forms of energy, electricity has emerged as the most convenient and preferred form. It has become a daily necessity for a common man for satisfying his common needs of water supply, transport, communication and lighting. It has made his life comfortable through technological and scientific innovations so much so, that now the consumption of electricity is regarded as the index of economic well-being. The per capita consumption of energy is highest in the USA (11,554 kg) and in India, it is only 218 kg. The per capita consumption of electricity in India in 1978-79 was 154 kwh.

The electrical industry has also helped the Government in its ambitious power development programme in the country.

The Indian electrical industry has made a good progress in the post-independence period. The progress would have been phenomenal if the power requirements of the electrical industry were met. The industry has been facing power shortages continuously for the last five years. The overall power requirement of the country during 1979-80 was 3861.13 GWH but actual supply was only 3271.34 GWH. The shortage of 589.79 GWH was highest during the last five years. The Sixth Five Year Plan estimates that the installed capacity of power generation by 1982-83 would be 44.6 MKW. Unless this capacity is installed, electricity generated and put into productive uses, it is feared that the progress of the electrical industry and entire economy as such will be retarded.

Today, the industry meets almost all the requirements of the country in the field of heavy electrical, industrial, domestic and agricultural equipment. These include generators, turbines, power transformers, motors, pumps, cables and wires, motor starters, welding equipment, LT/HT circuit breakers, transmission equipment, capacitors, condensors, fans, radio receivers, TV sets, lamps, refrigerators, air conditioners as well as many household electrical appliances. Owing to limited time at our disposal for discussions, we will restrict ourselves to household electrical goods.

Household electrical goods

In India, household electrical goods include fans, lamps, bulbs, refrigerators, air conditioners, as well as different electrical appliances.

Lamps and tubes: The history of lamp manufacturing dates back to 1932 when the first factory manufacturing GLS lamps was set up in Calcutta. The second unit was set up in 1936 in Bangalore. It was in the year 1952 that the production of fluorescent tubes, auto and miniature bulbs started in India.

Today, we have 14 units in the organised sector and a few in the small scale sector manufacturing GLS lamps. The units in the organised sector making fluorescent tubes and miniature lamps are 9 and 10 respectively. While no exact figures are available, it is estimated that the total investment in the organised and small scale sector is estimated to be over Rs 50 crores whereas total employment provided by this sector is approximately 15,000.

With the spectacular growth of the lamp industry during the last 50 years, the ancillary industries producing lamp components and other requirements are rapidly developed and today, there are more than 80 units manufacturing items like filament coils, molybdenum wires, lead-in-wires, glass shells and glass tubes, lamp caps, gases and dumet.

The production of GLS lamps which was 8.11 million pieces in 1946, rose to 182.77 million pieces in 1978 — registering compound annual growth rate of 10.3 per cent. The production of fluorescent tubes was 70,000 pieces in 1952 and 21.37 million pieces in 1978. The annual growth rate of the industry was 24.6 per cent, which is quite impressive. The auto, miniature and other lamps industry also grew well during the last 27 years. The production of such lamps was 14,000 pieces in 1952, which rose to 40 million pieces in 1978 thereby achieving annual compound growth rate of 24.3 per cent.

The Indian lamps and tubes which meet the world standard, are now becoming increasingly popular in foreign countries. During the last decade, the export earnings of the industry has grown up from Rs 39 lakhs in 1971-72 to Rs 500 lakhs during 1980-81. The international market for the products is good and is characterised by low prices. To compete and capture the international market, it is essential to sell bulbs at low prices. This needs certain backing and incentives from the Government. A more pragmatic approach in the field of raw materials availability, excise duty and licencing policy would go a long way in getting an increased share of the foreign market and expanding the domestic market.

The lamp industry is most self-sufficient. Most of the components and raw materials that it needs are produced indigenously. Now, tungsten filaments are also being manufactured in the country. Sometimes, tungsten filaments, glass shells and lamp caps are imported in order to meet the shortage and keep the production continuous.

With emphasis on rural electrification programmes, the demand for GLS lamps and fluorescent tubes will go up. The draft Sixth Five Year Plan envisages demand for GL lamps and tubes to be 365 million and 38 million pieces respectively per year by 1983-84.

Fans : Fan is a necessity rather than a luxury in a tropical country like India. The fan industry in the organised small scale sector made rapid strides in recent years in terms of quality and variety. The first fan industry was set up in 1912 in Calcutta by India Electric Works Ltd. The fan industry could not achieve much progress befor independence; in fact, the Second World War impaired the capacity and obstructed the growth. With the advent of independence and the era of planning, the fan industry got a fillip and new entrepreneurs were encouraged to set up fan units. The result was obvious. The production of fans rose to 10 lakh pieces in 1960 from two lakh pieces in 1950.

The progress of the industry since 1960 has been characterised by technological improvements. The industry is paying considerable attention to research and development and has adapted new manufacturing techniques and substitution of raw materials, etc. This has turned out sophisticated fans. The industry has made full use of development of plastic and aluminium industries. The industry is now in a position to produce press-brake blades for more air delivery and greater air spread. All such developments and technological improvements have enabled the industry make its presence felt in

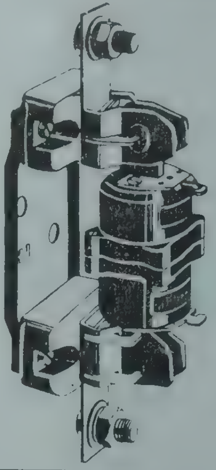
All Products tested by
N.T.H. Calcutta & C.P.R.I.

A RANGE OF QUALITY PRODUCT IN L.T. SWITCH GEAR



HADIN

Fuse-Bases

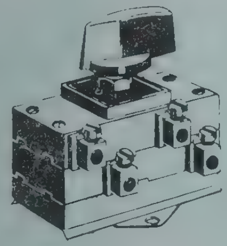
HIGH-RUPTURING CAPACITY FUSES

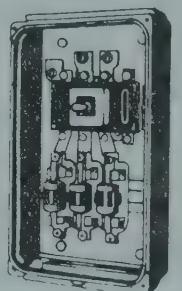
From 63 amps. upto 630 amps.

- Fast and slow acting types
- Breaking capacity 100,000 amps
- Low cut off currents
- Conforms to IS:2208

DUCO SWITCH

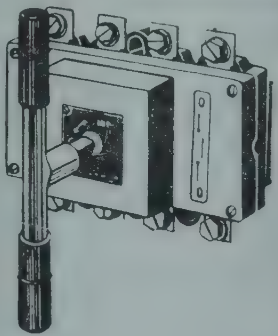
- Available in 32A & 63A
- Panel mounting - front operated
- On-load heavy duty Rotary Switch
- Having Moulded Case & Compact Construction
- Available in Cast iron or sheet steel enclosure
- Conforms to IS: 4047

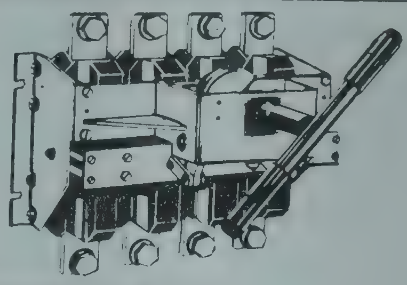




DUMECO SWITCH & SWITCH FUSE UNIT

- Available from 100A to 630A
- Panel mounting - front operation
- Onload heavy duty switch
- Having Moulded Case & Compact Construction
- Quick make, quick break design.
- Available in Cast iron or sheet steel enclosure
- Conforms to IS:4047



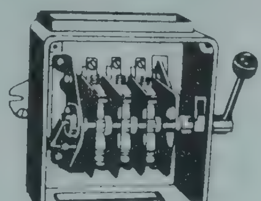


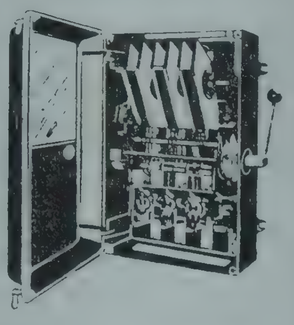
PAMECO SWITCH

- Available from 1000A to 3200A
- Quick make, quick break mechanism
- Heavy duty type front operated switch.

ISOLATOR/CHANGEOVER SWITCHES

- Isolators available from 60A to 5000A
- Changeover switch available from 32A to 1600A
- Side operated quick break
- very sturdy design





AIR CIRCUIT BREAKER

- From 200 Amps. to 1200 Amps.
- Quick make, Quick break trip free design
- Side or front operation
- Adjustable overload and electromagnetic short circuit Releases

domestic as well as foreign markets.

Today, there are about 300 units in the country manufacturing fans. Of these 300 units, 15 are in the organised sector. Around 5.5 million fans are produced in the country today. The Sixth Five Year Plan estimates a target capacity of 8 million fans for the year 1982-83. The industry today provides direct employment to about 15,000 persons. In addition, about 25,000 persons are enabled to earn their bread through its ancillaries and suppliers. The industry purchases about 59 per cent of its components requirements from the small scale sector.

The industry has also made strides in foreign markets. In 1970-71, it exported fans worth Rs 139.05 lakhs which rose to Rs 1,198.30 lakhs in 1979-80. However, Indian manufacturers are now facing steep competition from manufacturers in Hong Kong and Taiwan in the traditional markets of the Middle East and South-East Africa. Besides exporting fans, India also has exported know-how for manufacturing fans to Sri Lanka, Nigeria and Iraq.

Constraints : The industry faces various constraints. The main constraint is shortages of raw materials like silicon sheets, EC grade aluminium injects, aluminium sheets, pig iron, steel sheets and super enamelled copper wires, etc. Added to this, the power shortage prevailing all over the country has crippled the industry. Besides, imports of bearings have totally been banned. It is feared that the indigenous bearing manufacturers may not be in a position to meet the entire demand of the fan industry which requires quality bearings. Government should adopt pragmatic policies regarding distribution of raw materials and control of prices. In addition, the industry should try to adopt new production techniques so that the consumer will get a fan at reasonable price.

Refrigerators & air conditioners : The foundation of refrigeration and air-conditioning industry was laid in 1958 in our country. Since then, the industry has made remarkable progress. The industry started manufacturing compressors for refrigerators air conditioners and water coolers in 1968. Prior to that, most of the units were assembly units for various makes of imported compressors.

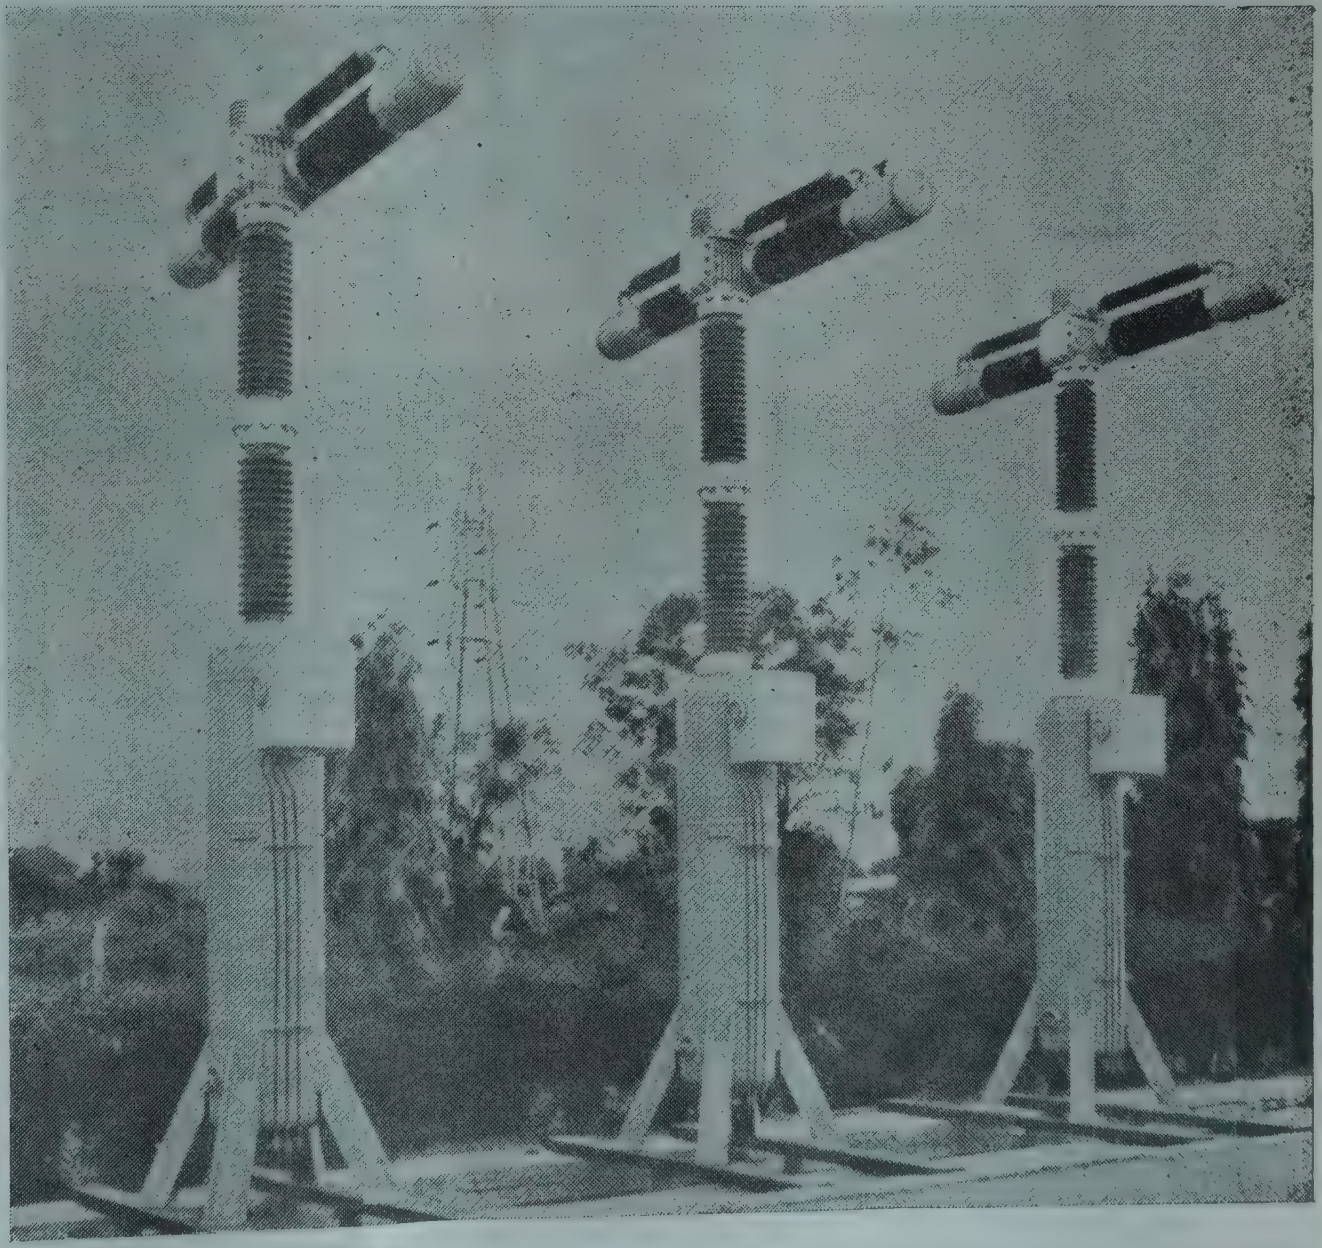
Today, there are six units in the organised sector with a total capacity of 3.39 lakhs refrigerators. The industry produced 11,388 refrigerators in 1960, which rose substantially to 1.77 lakhs registering 16.5 per cent compound annual growth rate. The capacity utilisation of the industry fluctuates randomly. From 1963 to 1970, the utilisation was between 120 to 181 per cent. However, after 1971, the capacity utilisation started declining. In 1978 it was only 48.7 per cent.

In spite of constraints on growth of refrigeration industry, the export of refrigerators has steadily gone up from Rs 47,000 in 1967-68 to **Rs 1.07** crores in 1977-78. Besides, the know-how is also exported. The food freezing plants and airconditioned textile mills have been installed in Greece, Cyprus, Sri Lanka, Thailand, Malaysia, Libya, Australia and Iran. Many developing countries are making increasing demand on the services of Indian engineers to instal and operate air-conditioning and refrigeration plants.

Air-conditioning : Today, there are seven units in the organised sector manufacturing air-conditioners in the country. The total installed capacity is 44,700 pieces. The industry produced 10,716 air conditioners in 1960 whereas in 1978 it turned out 21,359 air conditioners. The capacity utilisation of the industry has fluctuated widely during last 20 years from 34 per cent to 108 per cent.

In 1967-68, 15 air conditioners were exported fetching Rs 41,000. The export was highest during 1975-76 when over 1,500 air conditioners were exported at Rs 42 lakhs.

Constraints : The air conditioning and refrigeration industry has a vital role in the economic growth of the country. Eighty per cent of its products are used for industrial applications and food preservation. Besides, some of the important sectors of the industry which need the products of this industry are precision manufacturing industries, heavy construction industry, drugs and pharmaceuticals, textiles, telephone exchanges and broadcasting studios, research and testing laboratories, nuclear, hydel and thermal power stations, chemicals and petrochemicals, hospitals, hotels, defence

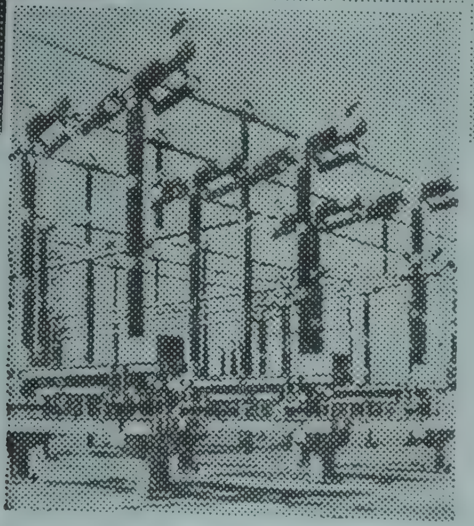


245 KV 10,000 MVA airblast circuit breakers

From NGEF yet another star performer

SF6 CIRCUIT BREAKERS

(From 66 kV to 400 kV and upto 50 kA)



NGEF THANKS KPC & MSEB

NGEF does it again—introducing **high performance SF6 Circuit Breakers** from 66 kV to 400 kV and upto 50 kA.

NGEF's collaborators, AEG-TELEFUNKEN are the first in the world to offer SF6 as arc-quenching medium (Patent dated 6.9.1938). The SF6 Circuit Breakers, which NGEF has introduced in India, have many distinct features which make them the most reliable and compact Circuit Breakers.

Here are a few unique features:

Puffer-type SF6 Circuit Breaker
For insulation: Low SF6 pressure. For arc-quenching: Generation of high pressure in an insulating nozzle by compression. Hence, trouble-free indoors or outdoors. No heating of SF6 gas necessary even at low temperatures.

High Breaking Capacity
The arc itself controls the blast intensity. High short-circuit currents—high quenching power.

Small Switching Overvoltages
Low inductive currents are gently handled. Overvoltage factors are extremely small. Pre-insertion resistors available for higher voltages.

No Re-striking On Breaking
Gas pressure, nozzle arrangement and moving contact speed matched such that capacitive currents are reliably interrupted without re-strike.

High Operational Reliability
All gas compartments sealed by power gaskets. SF6 gas cannot escape, nor moisture can enter.

Low Breaker Maintenance
Simple erection, few moving parts. Long intervals between inspection.

Pneumatic Drive
Combines the advantages of SF6 technology with the benefits of pneumatics. Makes the circuit breakers much simpler. Lower pressure which is less than 1/10th of hydraulic drive. Compressed air system easy to instal.

The Karnataka Power Corporation (KPC) has already placed order for nine 220 kV SF6 Circuit Breakers for Raichur Thermal Station and the Maharashtra State Electricity Board (MSEB) for five 400 kV SF6 Circuit Breakers.

NGEF thanks both KPC and MSEB for the confidence reposed.

Customer confidence and preference were proved when the National Thermal Power Corporation awarded to NGEF's collaborators, AEG-TELEFUNKEN, against global tenders, the contract for the supply of 27 numbers of 400 kV SF6 Circuit Breakers for seven substations including super thermal power stations at Ramagundam and Singrauli.

NGEF-THE DEPENDABLE NAME IN SWITCHGEAR

NGEF LTD IN COLLABORATION WITH **AEG-TELEFUNKEN**

Dattaram 'NGEF-604

services, etc. Today, the industry is in a position to meet the country's requirements for industrial applications. It has achieved self-sufficiency and a degree of sophistication that matches standards prevailing in any part of the world. The industry provides employment to more than 70,000 persons.

The industry currently bears a heavy burden of taxation. This burden, as per MCEAR, has proved to be counter-productive. The progress of the industry is hampered owing to successive heavy doses of taxation which rose from 20 per cent in 1961 to 125 per cent in 1979-80. The excise duty on refrigerators is as high as 40 per cent to 110 per cent. This means that in 286-litre refrigerators the tax element as percentage of current price exclusive of tax on inputs is as high as 135 per cent and on 165-litre, the tax element is 90 per cent. In one-tonne air conditioner the tax element as percentage of price exclusive of tax on inputs is as high as 200 per cent.

The industry is no longer a luxury but is an essential one to economic growth. The industry is taxed considering it to be a luxury. The taxation measures should stimulate the production and not inhibit it. There should be proper co-ordination between taxation authority and licensing authority. The DGTD has estimated the demand for refrigerators and air conditioners at 4 lakhs and 48,000 pieces respectively. But the actual production was only 1.40 lakhs and 20,000 only. The industry in future will grow only if rational steps towards taxation are taken by the Government in respect of the industry.

Electric motors

The Indian electrical motors industry is well established in the country. The industry has developed technical know-how with which it produces motors of different ranges and of diverse uses.

Today, there are 35 units in the organised sector and about 250 in small scale sector with an installed capacity of 6 million kw per annum. Additional capacity of 2.76 lakh kw has been approved through letters of indent thus making total approved capacity of 5.2 million kw in the organised sector. The electric motors from 1 hp to 10 hp — AC except special type and FHP motors AC – excluding special type have been reserved for the exclusive development in the small scale sector. The manufacturers in the small scale industries sector make general purpose motors upto 20 hp. The units in the organised sector produce motors with a capacity upto 450 hp and the units in the public sector make motors upto 1,000 hp using advanced insulation system.

The production of electric motors in 1977 was 2.98 million kw which rose to 3.02 million kw during 1978 thus registering a modest growth of 1.3 per cent.

1979 experienced a shortfall in the production when the industry could produce only 2.83 million kw. This fall in production (6.29 per cent over previous year) is largely owing to the fact that one of the units in the organised sector ceased to produce motors in 1979.

The demand for electric motors is linked with development of power generation capacity. The task force of Planning Commissioner has estimated the demand for various type of electric motors at 6 million kw by 1982-83. It is estimated that the demand at the end of 1989 would be 8.9 million kw.

Imports of motors are restricted to specialised types such as flame-proof motors and variable speed motors which indigenous manufacturers are not able to manufacture because of their design or delivery considerations. The import of motors in 1978-79 was Rs 7.4 crores. As against this, export earnings during 1976-77 was Rs 1.62 crores and in 1977-78 Rs 2.10 crores.

The industry faces certain problems in the field of raw materials. The raw materials like stampings for starters and rotors, enamelled copper wires, copper bars, insulation materials etc are not being produced indigenously but are imported. The another difficult situation the industry faces is that on the one hand the prices of raw materials have gone up but on the other the industry has tariff restriction owing to which the industry cannot increase the prices of motors.

Transformers

At present there are 33 units in the organised sector making power and distribution transformers. Besides, in small scale sector there are a large number of manufacturers making distribution transformers of lower ratings.

The licensed capacity in the organised sector is 28.05 million kva per annum and installed capacity of 27.05 million kva. In addition, letters of intent covering a capacity of 5.096 million kva has been issued making total licensed capacity of about 33 million kva.

The production of distribution and power transformers together has been growing at the rate of 8.9 per cent per annum (compound) during last decade. The combined production in 1979-80 was 23..506 kva thus making 86.9 per cent use of installed capacity.

The Task Force of the Planning Commission has estimated the demand for transformers to be 30 million kva per year by 1982-83. Keeping in view the demand and capacity approved, the additional demand could well be met by expansion and upgradation of existing units.

The imports of transformers are marginal. The foreign exchange earnings from transformers during 1975-76 was Rs 4.28 crores which moved up to Rs 4.82 crores in 1976-77.

The industry is mostly self-sufficient in production. Most of the production machinery, by and large, are available indigenously. Only for higher rating transformers, special type of testing equipment are imported. Besides, main raw materials like CRGO steel, special insulating materials, and copper for winding wires required for transformers are still imported.

Pumps

The Indian pump industry started its operations in the early 20's when three pump units were set-up in India. Prior to this, even hand pumps were imported. Since then, during the last 60 years the pump industry has made a good progress in terms of quantity, quality and technology.

The industry makes the pumps which could be used in the fields like agriculture, irrigation, construction industry, mines, refineries, chemical manufacture, process steel plants, power generation, sugar, paper, dry docks, shipping, etc. The various types of pumps manufactured in the country are centrifugal pumps, multi-stage, radial and mixed flow, non-clog, split-case, self priming, axial flow, verticle turbine, submersible, rotary, reciprocating, diaphragm, gear, and mono-block pumps.

At present, there are 46 manufacturers of pumps in the organised sector and over 400 manufacturers in small and medium sector. The industry today produces annually seven lakh pumps. The production in the organised sector was 2.88 lakh pumps, which rose to 3.70 lakhs in 1980 registering annual compound growth rate of 6.5 per cent. The industry also made a reasonably good progress in making process pumps. During 1978-79 the production of such process pumps reached to 5,000 numbers valued at Rs 11.50 crores.

Indian pumps have made a steady in-roads into the overseas market. Currently, more than 20 manufacturers are regularly exporting pumps to more than 65 countries of the Middle-East, Far East, Africa, Europe, Australia, New Zealand, etc. The export in 1975-76 was Rs 64.5 million which rose to Rs 84.5 million in 1978-79 registering annual compound growth rate of 9.4 per cent. The industry not only exports the pumps but also the technology to developing countries. The joint venture projects are set-up in Malaysia, Sri Lanka, and Mauritius, to manufacture pumps. The process pumps for certain appli-

In electrical components the critical difference is the high-power quality.

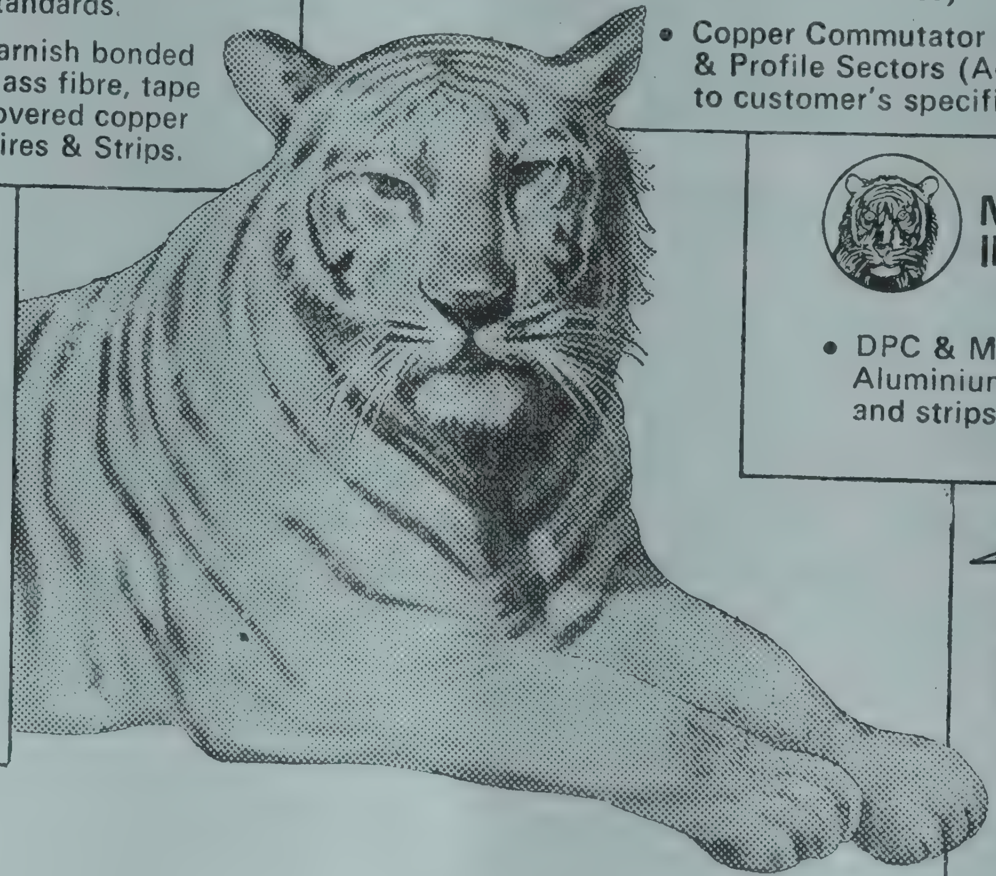
Here are products of rare quality, as rare as
the White Tiger of Rewa,
where these are manufactured.

VINDHYA ENTERPRISES

- PTFE/Paper covered Aluminium/Copper wires and strips manufactured to highest precision standards.
- Varnish bonded glass fibre, tape covered copper wires & Strips.

KEN ELECTRICALS LIMITED

- Copper Bus Bars (Sizes ranging from 10mm. to 150mm. width 1·5mm. to 30mm. thickness)
- Bare Copper Strips (Sizes from 2mm. to 25mm. width and 1.5mm. to 10mm. thickness)
- Copper Commutator Segments & Profile Sectors (According to customer's specifications)



TUMUS ELECTRIC CORPORATION LIMITED

Transformer Laminations & Strip Wound Cores from C R G O Sheet. Precision electrical laminations manufactured to highly specialised techniques.

MERCHANTS INDIA

- DPC & Multi paper covered Aluminium and copper wires and strips.

KEN ELECTRICALS

A.A.C.,
A.C.S.R. &

cations are also imported along with complete process plants. The import of such pumps was Rs 15.8 million which steadily rose to Rs 60.9 million in 1976-77.

The total capital investment in the pump industry is to the tune of Rs 300 million. The industry provides employment to about 20,000 persons.

The Sixth Plan working group has projected the production requirements for all types of pumps at Rs 82 crores by 1983-84.

Appliances

Compared to fan, lamp, tubes, refrigerator and air conditioners household electrical appliances industry is of recent origin. But the progress it has made during last 15 years is full of promise for a bright future. Knowing the role the industry can play, the Government has rightly thought of imaginative policy of reserving the products for small scale industries. This, of course, has paid dividends. Today, there are more than 600 small-scale units all over the country producing wide range of appliances worth Rs 20 crores.

At present, the industry produces indigenously, washing machines, hair dryers, saucepans, kettles, mixers, ovens, cooking ranges, water heaters, geysers, hot plates, room-heaters, electrical irons and toasters, etc. Most of these appliances are a boon to the housewife who can save time and energy.

The industry is in the small-scale sector and therefore, has its inherent problems, such as economies of scale. This adversely affects the cost of production, quality and finish of the products. The industry, therefore has to face severe competition from imported goods which are superior in appearance, finish, quality, etc. Second there is a bias in the developing countries like ours for such foreign appliances. The industry, therefore. has to produce quality appliances and force the foreign appliances out of consumers mind.

Besides, the strong bias for foreign appliances, the industry has limited finance which does not permit it to carry on production on a large scale. In addition, fluctuating prices and availability of raw materials and persistent power shortages have crippled the growth of the industry. It also lacks basic research and development facilities. There is also a lack of quality consciousness and finish on the part of the entrepreneurs. Added to this, the ever increasing taxes and excise duties which have forced up their prices and tended to place them beyond the reach of the common man.

Since, the entrepreneur in the small scale sector has to manage all the fronts of the unit *viz*, production, purchase of raw materials, quality control, marketing, Government formalities, etc, he cannot pay adequate attention to marketing of his products. In spite of these various constraints, the industry has a better future.

Knowing well the limitations of the entrepreneurs and the market for electrical appliances, some of the leading marketing organisations are playing a very vital role in development of the industry. In fact, the industry has attained its present status largely owing to the vast and varied assistance given by these organisations. They provide technical expertise, financial assistance and to some extent research and development facilities. They have helped to standardise the specifications and manufacturing by creating quality control facilities. Due to the vast distribution network that they have at their disposal they have been able to create demand for these products country wide. Besides, they provide prompt after-sales-service which gives the consumer his money's worth. These marketing organisations can play a better role in promoting the industry but factors like unorganised sector, lack of reliable data on production, demand and sales potential, varying tax structure, etc, are limiting the role of the organisations.

Any household electrical appliances has an element of hazard. It is handled by a layman. Every appliance has to be designed and produced very carefully else it will lead to serious consequences. The spurious and substandard goods therefore have to be checked effectively. The Government authorities alone cannot do it. The consumers will have to co-operate with Government in spotting such spurious goods. The Consumer Guidance Society and several other social organisations are active in this field and have trained the consumers in use and purchase of electrical goods. The Bajaj Electricals Limited organises consumer meets where consumers give their frank and fearless opinion about the products the organisation markets. The consumers are also encouraged to give suggestions for improvement in the products. The first three best suggestions are rewarded suitably. The suitable suggestions are incorporated wherever necessary.

The per capita expenditure on electrical appliances is also regarded as an economic indicator. Today, in urban India per capita expenditure on electrical appliances is only Rs 3. In West Germany 9 out of 10 families have refrigerators, 8 out of 10 have washing machine, 7 out of 10 have cooking ranges and 6 out of 10 use electric water heaters. There lies vast potential for such time and labour saving, electrical appliances and with increasing emphasis on rural electrification some of these appliances will also be demanded by rural housewives. This vast and potential market can be tapped with a pragmatic approach to the problems of the industry on the part of manufacturers, marketing organisations and Government authorities.

Kirloskar®

KEC alters concept of growth
– by helping ancillaries and
engineering industry to grow with it

Kirloskar Electric. An integral part of the nation's progress. And the prime drive in a multitude of industries.

KEC has achieved a phenomenal diversification to match the growing needs of engineering industry. KEC also helps its ancillaries by providing them technological support and instilling in them quality consciousness.

These achievements are a result of dynamic management, extensive R&D activities and training programmes and excellent after-sales service. No wonder KEC products are held in high esteem in India and abroad.

At KEC, all activities are encouraged for maximum utilisation of resources. And conservation of energy.

OUR PRODUCT RANGE

AC Machines - Motors up to 1500 kW (2000 HP); Generators up to 1500 kVA • DC Machines up to 800 kW (1000 HP) • Machine Systems - No-Break Sets up to 400 kVA; Ward Leonard Sets up to 500 kW; Machine Tool Drive Systems • Transformers up to 20 MVA/220 kV in two windings; Auto-Transformers up to 50 MVA; HV Testing Systems up to 1200 kV • Welding Equipment, Accessories and Systems • Defence Equipment - Power Sources and Electronic Control Systems for Industrial Drives - HF Induction Heaters, Induction Tube Welders - Power Sources and Systems

Converting energy for the millions

Planning for power sector

By A. K. KHOSLA

THE growth of the power development programme requires analysis of the mode of the power generation mix *i.e.* thermal, hydro and nuclear. With the depleting natural resources, stress has come on renewable resources like hydro stations. The mix of thermal, hydro and nuclear would have to be based on load pattern with the base load being met by thermal and nuclear stations while utilisation of hydro stations should be based on water inflow pattern and peak demand needs. Rating of sets especially thermal and nuclear needs to be determined keeping in view size of a system and to avoid multiplication of sizes. The country has gone in progressively for installation of larger thermal sets and is poised on the introduction of 500 mw set, to meet the projected demand but with this growth in size of the generating sets, it is equally important to study its implication from the point of view of reliability, operation and maintenance on the design of power station system as a whole.

So far, hydro is the only renewable resource, which has been commercially exploited. Lot of hydro potential is still left for exploitation for electric power generation. Better management techniques are being considered to improve project management of hydro stations to reduce gestation period.

For best utilisation of power generation equipment, and for overall efficiency purposes, thermal and nuclear stations need to operate at a continuous high load factor. The peak load demand is normally taken care of by the hydro stations wherever possible. It has been found economical in some cases to store water after it has generated power and to pump it back to the original reservoir using power from the grid during lean demand period *e.g.* at night. The pumped water can be used to generate power again during peak demand period. Only one such scheme has been commissioned in India so far at Nagarjunasagar. We would need to consider more such schemes.

Excerpts from Mr Khosla's recent presidential address at the annual general meeting of the Institution of Engineers, New Delhi as published in Urja.

Consideration can be given to the installation of very small hydro sets of capacity around 1 to 2 mw in rivers/canals to meet small loads, particularly in the rural areas.

Thermal power stations

In our present context, because of shorter construction time for thermal power stations, stress would continue to be on thermal power stations. The construction period for these plants is being shortened by using better project management techniques, *i.e.* NTPC at Singrauli, and other super thermal stations and by BHEL at Parli in Maharashtra. Standardisation and layout would go a long way in achieving these objectives.

For using low grade coal, design of fluidised bed boiler is under development for ranges up to 5 to 10 mw. In other countries such plants of capacities up to 10 mw are in use. These plants can be set up near the washeries and number of such schemes when in operation will result in improvement of power generation.

It has been possible to improve overall efficiency of thermal plant. by using gas turbines in conjunction with conventional steam turbines, the exhaust gases of gas turbines providing the thermal inputs to heat exchangers for raising steam.

Coal appears to have its own problems regarding exploitation and transportation. Availability of oil is also very uncertain. Nuclear power plants will be contributing a lot to electricity generation in the future. In this context, we have to decide on our policy and the type of nuclear reactors to be used in the country keeping in view availability of resources in India to overcome dependence on foreign countries. Breeder technology appears to be a promising possibility.

Policy of location of power stations : Most of the coal mines are located in central and eastern India. State Electricity Boards locate thermal power stations within their states resulting in transportation of coal over long distances. Moreover, our coal has an ash content of about 30 per cent to 40 per cent. Hence, a decision is to be taken whether to allow transportation of coal over long distances or to transmit power over long distances instead. This would necessarily mean setting up of thermal power stations under the central sector like NPTC. *etc*, at the pitheads and then distributing power to various States which do not have either the coal or the hydel resources. Transmission of power over long distances would essentially mean using EHV and high voltage direct current transmission techniques. Similarly, the nuclear power development programme would have to be seen in this context and it would be desirable to locate such stations near the seacoasts from the point of environmental conditions and availability of water. The location of such large thermal and nuclear stations would reduce considerable load on the railways for transportation of coal. On the other hand this would necessitate interconnecting very closely various state grids and would lead to formation of stronger national grid.

Development of transmission systems

A development of strong transmission system is a natural corollary to the increase in power generation capabilities, otherwise increased generating capacity would have limited benefits. If the large stations are set up near the pitheads or on the sea-coasts, evacuation of power from these stations would need a very strong inter-connected national grid. An effective transmission system of transmitting power over long distances would need transmission lines in EHV/UHV* range and also introduction of *HVDC. These are important from the technical and economic point of view. HVDC is a new field of transmission and it has not been developed in India. Advance planning and R & D work would have to be done before such high technology system can be introduced.

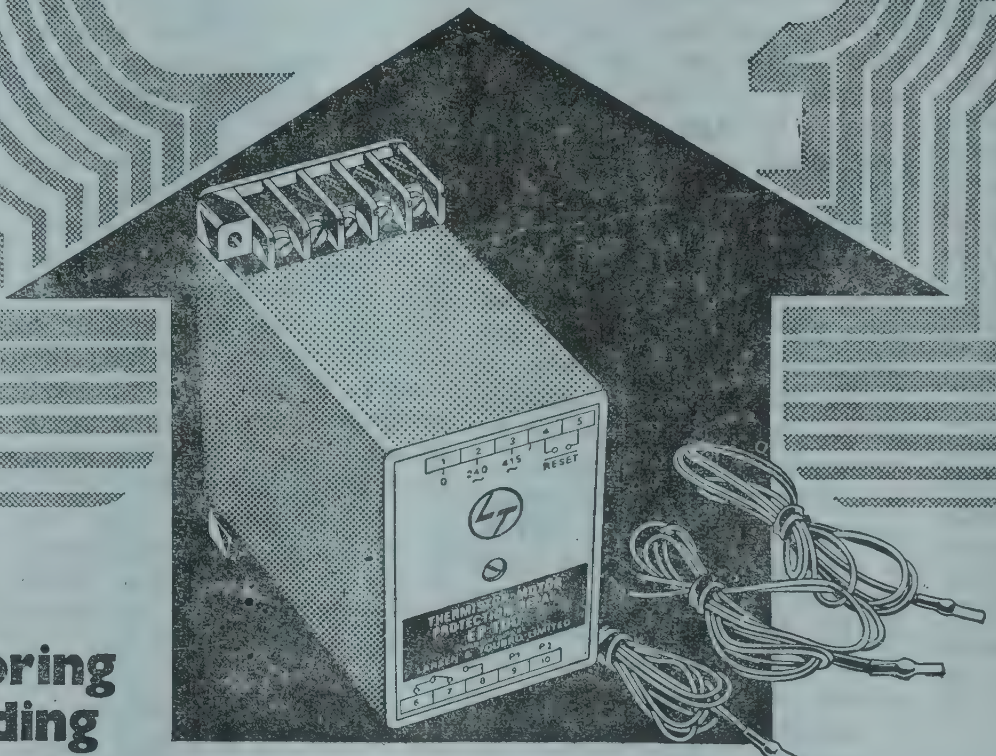
Load despatch centres: The formation of strong national grid would require introduction of load despatch centres all over the country to ensure automatic flow of power from one region to another to meet the needs of various load centres. This would need to have a very good communication system like microwave system. In addition, to enable load despatch engineers to take quick decisions, microcomputers and micro-processes will have to be introduced. The complex calculations which need to be done effectively would take a long time if done manually.

For meeting very small loads, especially, in the rural areas, certain non-conventional methods can be considered. One such method is of tapping an EHV line and using its capacitance coupling effect for feeding small loads.

Management

The responsibility of generation and distribution of power is with the various SEBs and central organisations like National Thermal Power Corporation and National Hydro Power Corporation. Considerable proportion of plan outlay is invested in this sector and another Rs 25,000 crores is to be invested in this sector in the next five years. The SEBs

L&T introduces the concept of total motor protection...



direct monitoring of winding temperature with THERMISTOR MOTOR PROTECTION RELAY EP 100

Overheating is the direct cause for burnt out motor windings. Various conditions—electrical, mechanical, environmental—lead to overheating. Conventional protective devices usually monitor one or more of these conditions. But EP 100 directly monitors the winding temperature and trips the motor starter before windings are overheated. The result: total protection against all conditions that lead to overheating of motor windings. What's more, with EP 100 you can expect full utilisation of motor output.

EP 100 for total motor protection

and the largest commercial organisations employing very large workforce. As the main objective is to ensure commercially efficient working, it is desirable that SEBs use modern management techniques. This aspect was discussed during the power ministers' conference held in January 1978. Also recently Rajadhyaksha Commmittee on Power has submitted its report to the Government on planning for power development, project promotion and implementation, operation and maintenance, financial management, rural electrification, organisation management, research and development and short term measures to alleviate power shortage.

In view of the importance of the issues involved it is recommended that time bound programme may be drawn up on implementation of the acceptable suggestions.

From the point of view of engineering profession, it is proposed that we should have an all-India service of power engineers available to various SEBs and Central Government utilities for planning, operation and maintenance etc. This cadre would also have to develop disciplines to deal in diverse technical fields involved and which vary very widely such as electrical power technology, instrumentation and control engineers, metallurgical, coal technology, chemistry and hosts of other such disciplines. The cadre should be professionally oriented and interchange would depend on the type of disciplines involved. We should ensure adequate career growth in all diciplines. Rajadhyaksha Committee report has dealt with this subject in depth and in detail.

Short term measures to improve power position

To meet the immediate power needs, and to reduce gap between the demand and supply, improvements and renovation have been carried out in a number of power stations and this has substantially improved their performance. Improvement in performance is also possible by using better operation and maintenance techniques in power generating stations, and better spare parts management. One area which requires further immediate action is that of 'auxiliary equipment'. These items require improvement both in quality and specifications. Consideration can be given to replace some of these items by those with better specifications.

In case of hydro stations, better water management is needed.

In our effort to improve the operational skills, as bigger and complicated sets are being introduced, steps need to be taken to strengthen CEA training institutes. For this purpose, a separate society has been formed by Energy Ministry under a Director General. Additional institutes will also be set up. It is also the intention that the operators should have proficiency certificates before being posted in a power station. Special intensive training courses by manufacturers would assist in avoiding maloperations.

Conservation of energy: Efficient use of electrical power in industry, the largest user, needs to be examined. Government may have to insist on minimum efficiency levels for electrical power utilisation but consumers themselves could do a lot. In addition, in this field, ISI with certification mark schemes, has a role to play in such items as pumpsets, motors, etc.

R & D in power sector

With setting up of super thermal stations, at pitheads, hydro stations in remote areas and introduction of extra high voltage, ultra high voltage (750/1,000 KV) and high voltage DC for evacuation and inter-flow of power, number of technological problems are likely to arise requiring intensive R & D efforts by SEBs, CEA-CPRI. Power development programme as envisaged is also likely to involve application of micro-computers and micro-processors. It is recommended that these problems are identified now and responsibilities fixed on the participating organisations to have reliable solutions well in time.

Present expenditure in R&D in power sector is very meagre. Matching 'R & D' work will have to be also done by the respective manufacturers of equipment involved Perhaps CEA is best suited to coordinate this work at national level.

Project management, planning, standardisation

For proper execution of projects bunching of orders is to be avoided as far as possible. Power development has to be phased out on monthly basis to ensure regular supply of material and components and to ensure not only planned achievement in erection and commissioning of new plants, but also to ensure that the manufacturers can take steps to meet various spares requirements.

Each project needs to have a chief executive appointed soon after sanction of the project and should continue till successful completion of the project for ensuring smooth running and timely completion of the project and single point responsibility. He should have the required infrastructure and adequate financial and administrative support from management. It has been experienced that divided responsibility leads to a lot of bottlenecks and delays.

All these are possible only if funds are available in a planned manner as and when required for which advance planning is necessary. The starting point of power station project is the layout design and formulation of specification of various items of equipment. These need to be standardised as far as possible and specified very clearly, so

VADODARA

Shaping technologies for a better life—your life.

that modification could be avoided. Power station engineering is as important as the execution of the project. Hence to reduce overall cycle time of execution of projects, standardisation of power station engineering and layout is of utmost importance.

Role of consultants

For a massive development programme, consulting engineers or similar organisation along with CEA have a very major role to play. The whole power station and power system design is normally conceived as a total system which would mean that a well thought out technical investigation is required for integrated development of power programme. Hence, the effort would be to strengthen the consulting engineers' capability in the country. Standardisation of power station layout would go a long way in reducing the time and cost for setting up such stations. The standards layout should allow for the working conditions prevalent in this country rather than following practices of foreign countries. It may be necessary to have a review of the philosophy of power station design by building in the necessary redundancy in various systems to improve the overall reliability of the power stations. The consultants have equally important role during construction and commissioning of the project. It is they who advise the SEBs on the specifications of various items of equipment. It is absolutely necessary that their participation is ensured till the commissioning of the power station and taking over by the operation wing of the SEBs.

Role of manufacturers

To meet this massive power development programme, indigenous manufacturers have to not only keep pace with current needs of power system both in quality and quantity, but have to plan and develop in advance resources for design and manufacture of various items of equipment involved. Based on the experience gained so far, the equipment has to be made suitable for Indian environmental conditions and lot of R & D effort needs to be put in. Expenditure on this aspect in India is only a fraction of what contemporary organisations world over spend. Because of scarce capital and acute shortage of power, quality of equipment both in design and manufacture should be approaching 'zero defect' level as we can ill-afford any breakdowns or shutdowns.

Manufacturers can also help in training of operators in their equipment. Availability of spare parts and services have to be of the same standard as prevalent in advanced countries.

The challenge of the future

All this needs highly trained and mature engineering manpower. Advanced planning and orientation in technologies would help in meeting the future challenge of providing equipment to meet this colossal power programme.

The country's massive power programme requires various items of equipment not only of high reliability but also of up to date technology developed suitable for Indian conditions. ISI Standards are based on feedback received from actual operating experience. Hence, manufacturers should endeavour to continuously improve their equipment. In a near monopolistic situation this seldom happens. Hence Government may examine whether some sort of competition is introduced in the industry. This will not only lead to better designs but also make available to users alternative technologies. Demand is large enough to ensure economical loading and working of manufacturing plants.

To match the demand, the power generation capacity has to increase at a much faster rate than is happening in other countries. Similarly, time for construction, commissioning and stabilisation of such power stations has to be shortened. Transmission systems have to be strengthened for formation of the national grid for ease of interchange of power between SEBs/regions. Arising out of policy on power development, certain technical problems, *e.g.* impact of 500 mw set, UHV/HV DC transmissions, are likely to be thrown up which would require that R & D efforts are undertaken well in advance. Manufacturers of various items of equipment would have to plan, develop and take steps well in advance to ensure timely availability of equipment both in quantity and quality. Matching R & D efforts would be needed for this purpose.

To achieve these objectives, human effort and management has to be rationalised. Proper training, career planning (enhancement of technical skills and knowledge) should be some of the essential prerequisites for such a gigantic task.

Turbines and generators : Some technological aspects

Concluded from page 21

coils have been giving trouble in service. In recent years, BHEL have introduced the improved mico-plast insulation and it is most likely that the new system of resin-poor tape and vacuum impregnation (as for KWU turbogenerators) will also be adopted for the hydro-generator coil insulation. Two orders received from New Zealand for a large number of 50 mw hydro-generators highlight the fact that the technology and manufacturing capability of BHEL is well accepted in the export market, not to say of the competitiveness in price. In contrast, BHEL seems to have made no headway on water turbines and it is likely that the technology level may be one of the factors against them.

Insofar as the technology of the water turbine is concerned, it may appear that the introduction of a new technology from any of the firms which are having a large share of the world market based on ingenious design features and superior technology, may have some justification. It is well known that the manufacturing operation for water turbines involves a large quantum of skilled manual labour for high class welding, fitting and assembly of heavy plate work besides machining and grinding of over-size components such as castings, forgings, rotor blades, etc. The Central Foundry Forge project of BHEL, Hardwar, has made good progress in the production of small and medium size of stainless steel runner castings for Francis and Pelton turbines and the cast-steel blades for Kaplan turbines as also of large size shafts of simple profile. In course of time, it is expected that heavier runners and special shafts (such as off-set forgings) would be successfully made available. In view of all this, the water turbines, generators, valves and allied equipment could be an ideal line of products for India to make a breakthrough in the world market. Some of the senior consultants and experts feel that the Japanese equipment, by the use of high tensile steel and many other innovations in design is about 20 to 30 per cent less in weight and price than BHEL machines. With concerted effort, backed by superior technology, this position should change and help India to get a good share of the world market.

It is clear from the above, that there are still many problems to solve and much improvement to be made. Even so, a steady flow of large and medium power generation equipment has been established with a fair level of efficiency and economy. This will pave the way for a good future for this industry.

SIEMENS

Sharing

In a developing economy, funds must be employed where they are most needed. We share our earnings The greater part to the National Exchequer. A substantial portion for growth—new plants, more employment. A significant foreign exchange contribution through exports.

First phase of Siemens Switchboard plant at Nasik.

A turnover increase of 77% in 5 years has enabled Siemens to contribute directly and indirectly, 64% of its earnings to the National Exchequer. 62% of net profit ploughed back for growth. Rs. 285 million in foreign exchange from exports. And to 14,000 Indian shareholders, a steady dividend.

Siemens India today: 6 works and nearly 7000 employees. Engaged in power, communications, medical engineering for India's drive for self-sufficiency.

Turbines and generators: Some technological aspects

By S. SWAYAMBU

ALMOST all product lines in the heavy electrical industry call for a high level of technology and it is by far the most sophisticated in respect of turbines and generators. This segment of the electrical equipment industry has been exclusively entrusted to the BHEL, presumably in view of the heavy capital investment, large manpower deployment and the long gestation period. In the last fifteen years, a great deal of effort has gone into the setting up of the manufacturing facilities, training and transfer of foreign technology. More than all is the acquisition of a good proficiency in the design and engineering aspects, which undoubtedly form the key to the success of the project over the long term

Compared to the more advanced countries, India entered this field fifty years late with very little background experience in the design and manufacture of even small machines. All at once our men, after a patch of training, were exposed to technologies, machines and processes of very large dimensions and this would necessarily take a toll in time and cost resulting to some extent, in frustration and disappointment all around. However, given the patience and encouragement, the technocrats and artisans have made a success of the trust reposed in them. The present position and the future needs in respect of the technology aspects is intended to be reviewed briefly in this article.

Steam turbines and generators

At the outset, one would like to know why India should have entered into three technical collaborations from three different countries for manufacture of steam turbines and generators at three locations, covering to some extent nearly the same ratings of machines. With wide disparity in design and manufacturing practices, this has obviously resulted, over the last 15 years, in a tremendous effort in the transfer of the respective technologies. The original intentions for this multiple collaborations, have not been spelt out anywhere but it is obvious that it is a historical outcome of India having to avail of whatever foreign assistance programmes were fothcoming at that time (mid and late fifties). Even though three different locations were established, each one was planned and equipped for a limited quantum of output only, so that the total production would match the country's requirements for thermal plant, which was expected to grow rapidly in the seventies and after.

Mr S. Swayambu

However, based on the experience so far gained, BHEL has recently started to integrate and rationalise the technologies and oprations at the three plants. The larger Hardwar Plant is being expanded for the manufacture of sets up to 500 mw and possibly larger as and when required in future. For the enlarged manufacturing programme of 200 mw and 500 mw steam turbines and generators, a newer technology from a West German group known as KWU has been obtained by a new collaboration with the intention of replacing the earlier USSR technology already adopted for the 200 mw turbine and generators. In the meantime, the plant at Hyderabad has reduced the output of 110 mw sets based on the old Czech technology and increased the production of industrial turbines in the range of 3 to 30 mw based on a separate Siemens collaboration. The present trend however, seems to point out that the existing Czech and Siemens technologies will gradually give way to that of the more up to date KWU tie-up covering a range of industrial as well as condensing power turbines of ratings in the range of 1 to 200 mw along with a range of matching turbo-generators.

The Bhopal factory, which has been planned on GEC (UK) collaboration for 120 mw sets, would gradually cut down the production of this machine and instead take up a limited programme for the 200 mw sets of KWU design. The 235 mw steam turbine (of English Electric design) for Indian atomic power stations would of course be continued at Bhopal, with the matching turbo-generator (of USSR design) being made by the Hardwar plant. It would, therefore, appear that a kind of hotch-potch programme based on three technologies has been useful only to the extent of helping the Indian engineers and workers to acquire some technical and manufacturing skills of the difficult line of large turbine and generator by three different routes in the initial years. Obviously, it should have entailed high cost of setting up plant, tooling, training, indigenisation and transfer of technology of three systems as compared to that of a single system. Even so, the BHEL has recently made a deliberate plan to opt for yet another technology and unify the designs and manufacturing techniques, which no doubt would demand a great deal of further effort and expenditure. Nevertheless this is a step in the right direction.

BHEL has been guided by the fact that the three earlier technologies are about 25 years old and that for the vastly increased existing and anticipated demand for thermal plant in India which call for the installation of sets of larger ratings (500 mw, a change-over to a more up to date technology would be in the overall national interest. Admittedly, the unification of the systems in all the three plants would result in increased overall output and lead to a greater acceptability in the overseas markets paving the way for larger exports. In this connection, some confusion has been created on account of the public controversy which raged for some time over the proposed "umbrella type" collaboration with Siemens of Germany which is one of the partners of the KWU group.

Some people raised doubts whether the technology of KWU was in fact as good as what a few other well-known multinationals like G.E. of USA, B.B.C. of Switzerland or G.E.C. of the UK, could offer. Due to machine outages in thermal power stations in the last few years for various reasons, charges and counter-charges were being made between BHEL and the electric utilities as to the apportionment of responsibility. This situation has inhibited an objective view of the role played by design and technology and the supporting foreign collaboration. The following are some of the important points which would lead to a dispassionate understanding of the subject:

(1) The steam turbines of all three makes (based on the

Mr Swayambu is a consulting engineer and former chairman and managing director of Heavy Electricals (India) Ltd.

USSR, the UK and Czech types) are intrinsically sound and rugged machines and have been giving good service availability. Most of the causes for plant outages are connected with boiler and turbine auxiliaries, piping layout and instrumentation.

(2) The matching generators have also been performing well, except for a few cases of rotor failures.

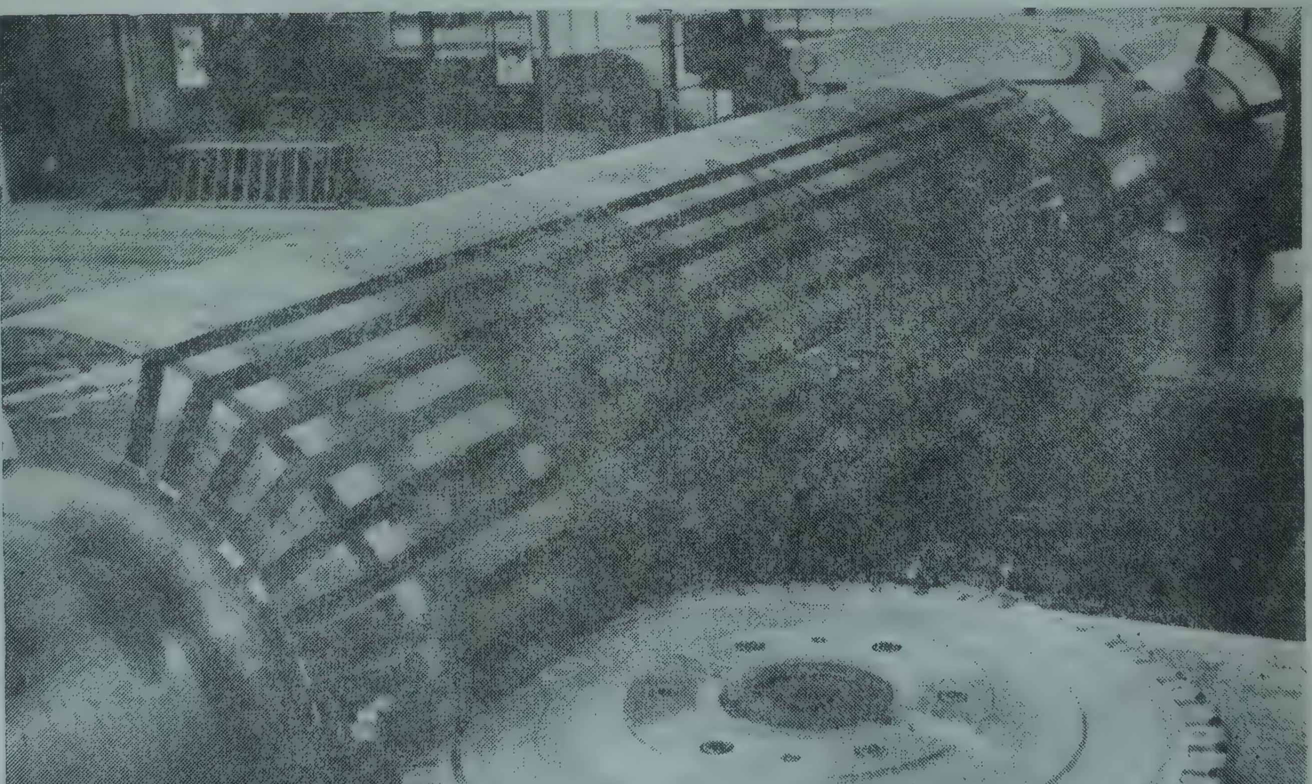
(3) Despite the above experience, a change-over to a more up to date technology is considered inescapable from the point of view of lining up with other world leaders in this field with a view to realising improved economy in manufacture and better operating performance. This would also result in increasing exports in future. During the sixties, a large number of G.E. (USA) sets have been installed in a number of Indian utilities under some aid or credit facilities. Experience on these machines has been very satisfactory and utility engineers rate the G.E. technology as very good. At the same time, they concede that the choice of the new technology is essentially a matter for the Government of India/BHEL. In actual fact, several excellent features do exist in the KWU design of 200 mw set which are considered to be most suitable for Indian operating conditions. These are : (a) A fairly short start-up time of 210 minutes for cold start. (b) A quick hot start in 10 minutes (realised through an HP/LP by-pass). (c) Provision of a turbine stress evaluator (to monitor stress under planned overload conditions). (d) Instrumentation is very versatile. (e) A very good heat rate. (f) The set could cope with a fairly wide range of frequency variation. (g) The set is easier to maintain (claimed by BHEL). (*h) The generator insulation system is of a superior type. (*i) The generator up to 250 mw is of non-water cooled design and is easier and less expensive to manufacture.

As compared to a 200 mw turbine of USSR design, the KWU machine is about 14 per cent lower in weight and somewhat shorter in overall length. The general feeling among consultants and senior plant engineers seems to be that based on the limited Indian utility experience, there is no scope to compare the merits of different technologies and that the KWU design should be deemed to be a good modern technology, probably, as good as what any other major international company could offer. The generator of the USSR design is being continued to be offered with the KWU turbine and a phased programme for the manufacture of KWU type of generator would be formulated when the related equipment for the new insulation system for impregnation of coils under vacuum, test facilities etc are fully established.

From the manufacturing point of view, the KWU design approach has one great advantage, in the modular feature covering a wide range of steam turbine ratings. A single modular system covers the bigger sizes from 200 to 1,000 mw, while another system covers the range below 200 mw. While the Indian market could be catered to by means of a few standardised ratings, such as 60, 110, 200 and 500 mw, the export market often calls for a variety of ratings (*e.g.* 150, 250, 350 mw *etc*) which could be met only if the facility of a modular design is available. In the long term, this would move BHEL to a competitive position in the international market, when Indian engineers acquire the ability to develop new designs of assured performance and quality standards. A good example of this potential capability among Indian engineers is provided by a striking piece of local development work to modify the USSR 200 mw turbo-generator for reversing its direction of rotation so as to couple it with the new KWU steam turbine. This has enabled the phasing out of the KWU generator manufacturing schedule by a few years to suit the operational needs of the factory.

An index of satisfactory technology transfer consists of the rate of indigenisation of imported components. For the 200 mw USSR design of turbine and generator, it has reached a level of over 70 per cent by value, the balance items under import being some of the large castings and forgings. BHEL's own captive foundry and forge plant (CFFP) at Hardwar has made commendable progress in successfully producing, since it started three years ago, a number of items of alloy steel castings and forgings for the 200 mw USSR set except a few over-sized forgings like rotors for the TG and the LP rotor for the turbine. It is expected that similar developments for the KWU set will also take place resulting not only in rapid rate of indigenisation but also help reach a high level of over 90 per cent in the next few years.

Following, the 1977 collaboration agreement with KWU, BHEL has received approval for a major expansion of the factory facilities at Hardwar costing Rs 43 crores (at 1978-79 prices) and as of early



Milling of ventilating slots on 110 mw rotor in Turbo Alternator Division of Bharat Heavy Electricals Ltd, Hyderabad.

---

* **Presently, the KWU** generator has not so far been taken up for production, although the collaboration

In engineering, excellence is never achieved by accident. It results from painstaking effort. And close attention to detail. Bharat Bijlee believes in this religiously. Take an example. A little thing like the thickness of paint on our transformers is measured critically. To protect the transformer against weathering and corrosion, we've set standards of paint thickness that have to be met. A few microns below or over the specified limit could affect durability. We make sure this doesn't happen. It's one of the thousands of little details that together add up to superlative quality. In every product made by Bharat Bijlee. Not just transformers. Motors, 'Olympus' lifts, ventilation equipment and mine accessories too.

Bharat Bijlee represents 35 years of pioneering endeavour in the electrical industry. Over the years, our products have constantly kept pace with technological advances. Through both, our collaboration with Siemens A.G., West Germany, as well as continuous indigenous development. Today we're poised for multi-dimensional growth. In fundamental areas of activity. Manufacturing and marketing new high technology products. Custom-engineered to meet the customer needs of tomorrow.

1981, over 50 per cent has been completed including a modern shop for the manufacture of turbine blades. The giant overspeed test bunker is under construction and all the items of work would be completed within the next 18 to 24 months. With the addition of these new facilities, the requirements of the KWU technology for sets up to 500 mw (and even larger sets in future) would be fully covered. It is, therefore, obvious that technology-wise, both in respect of design and manufacture, BHEL is getting to be fully equipped. As the KWU technology also gets established at Bhopal and Hyderabad in the interim period, a greater measure of standardisation would result. A further line of KWU technology would be available by a new collaboration agreement entered into in January 1981 for the lower range of turbines including industrial turbines.

Water turbines and generators

The manufacturing facilities for water turbines and the matching generators in the medium and large ratings were established both at Bhopal and Hardwar plants of BHEL and the production activity started in mid sixties and gradually picked up momentum in the following years. The technology for the Bhopal factory was obtained from the English Electric Co for water turbines and from the AEI for generators, both the UK firms. The technology for the Hardwar plant was provided by the USSR both for the turbines and the generators.

The design approach for water turbine and the matching generator set is radically different from that for steam turbine and generator set. For the latter, certain standard ratings of machines are fixed for the manufacturing programmes so as to make a reasonable coverage of the market demand over a period of years, thereby deriving the advantage of repetitive production of a few sizes. On the other hand, the ratings and types of water turbines and generators are determined with reference to the site conditions of each project, such as the head, water storage, flow regimen, power potential, the operating parameters of the power system, etc. Consequently, every water turbine and generator set requires to be tailor-made taking all the factors into account resulting in a near exclusive design for each project.

Broadly speaking, three distinctive types of water turbines are in use to cater to the low, medium and high heads, known respectively as Kaplan, Francis and Pelton turbines. Design-wise and component-wise, these three types are substantially different from each other but could be handled by more or less a common workshop facility for metal fabrication and machining. On the basis of the known characteristics of the hydro-electric potential in India, the majority of sites require Francis turbines (approximately 70 per cent) while the Kaplan and Pelton would be sharing the balance 30 per cent. The Kaplan type which caters to low head conditions, is called upon to handle a large volume of water discharge and hence is physically large in dimension and heavy in weight per KW of power generated. The reverse is the case with Pelton turbines, but much higher pressures and speeds will have to be catered for.

During the last 15 years of BHEL's involvement with the design and manufacture of hydraulic turbines, machines for a wide range of ratings from 10 mw to 160 mw covering all the three types referred to above have been successfully designed, built and commissioned. The first few machines were wholly designed by the foreign collaborators with Indian trainee engineers being associated with the design and drawing work done abroad. The next few machines were largely designed by BHEL design and engineering teams at Bhopal and Hardwar and vetted by the respective consultants. The subsequent machines of the conventional types were by and large designed by BHEL engineers and built and tested successfully in the two Indian factories.

The essential aspect of the individual design of turbines rests in the pre-determination of the performance of the machine by means of a scaled model test in a specially equipped hydraulic test laboratory. In the early years, a suitable facility was not available until the Cavitation Laboratory at the Central Water and Power Research Station (CWPRS) Pune, was set up for hydraulic experiments and tests. A number of turbine model tests were undertaken at CWPRS in the late sixties and early seventies which provided the necessary technical support. In recent years, a well equipped model test laboratory has been set up at BHEL, Hardwar, and this is meeting the test requirements for the turbine design work.

The process of technology transfer comprises mainly in learning the principles underlying the design approach and the collaborator's experience and feed-back information on the behaviour of a large number of turbines manufactured and placed in service over the past few decades. New designs are based on the large store-house of such performance data and often times slight modifications to an existing design could result in a new design which could then be improved by the incorporation of new material techniques and the performance of the turbine established by model testing in the laboratory. From this point of view, the longer the experience of a manufacturer, greater would be the access to first hand design engineering and performance data. As relatively new entrants in this field, BHEL will have to go through another 10 years of experience and enlarge their data and performance base before they could claim equal stature with international companies. So far, the largest rating of Francis turbine built by BHEL is the 165 mw machine for the Dehar power house in Punjab. It is hoped that in the next few years a few machines of larger ratings may be proposed for some of the new projects and BHEL could then move upwards in their capability.

In most of the advanced countries, hydro-electric potential has been almost fully exploited and they are moving in the direction of pump-storage schemes wherever feasible, which require reversible type turbine-generators, capable of dual functions, *viz*, turbine/pump and generator/motor. The technology required for this type of set is not only highly sophisticated but is often connected with large machine sizes. In recent years, single reversible units have been built for individual ratings around 500 mw. Conventional sets of this rating have also been reported in a few locations where hydro-electric potential available is large. In India, the pump storage schemes have been somewhat slow to get promoted and only in recent years three or four schemes have been sanctioned and these are currently under implementation. For this, BHEL went in for limited collaboration with one or two foreign companies on a project by project basis. A large scheme of this type, at the Nagarjunasagar Dam in Andhra Pradesh, has been undertaken with the equipment supplied by a leading Japanese firm and BHEL have purchased the technical data and drawings for these machines, so that similar sets covered by Stage II of this project could be made at Hardwar/Bhopal.

Insofar as the matching generators are concerned, the design approach is more or less straightforward as these machines are required to line up with the speed and the mounting and supporting details of the driving water turbine. The electrical rating is made proportional to the size of the turbine, subject to certain adjustments required to match it with the power system parameters such as power factor, short circuit ratio, frequency, voltage regulation, etc. The insulation system is important as some of the early generators which adopted the "bitumen" impregnation for the

Energy losses: Some reduction methods

By S. Y. KOTWAL

MUCH has been said on the necessity of reducing losses and utilising renewable sources of energy. However very little has been done. The following analysis attempts to throw some light on this.

A look at the Maharashtra State Electricity Board's "Conditions and miscellaneous charges for supply of electrical energy" January 1976 edition shows that for three-phase supply, the limit of maximum current demand is placed at three times the full load current, for motors up to 3 HP, two times the full load demand for motors up to 10 HP and one and a half times the full load demand above 10 HP and up to 50 HP.

The author attempts to show how this archaic rule leads to a lot of wastage in the unnecessary use of costlier starting gear since it does not stand on solid ground.

Limits are placed on the maximum current demanded by a three-phase induction motor during starting because it draws from the mains, a reactive current which causes a voltage dip for the duration of the current. This reactive current touches a peak value and progressively drops down. The duration when the peak value is sustained is transient in character whereas a steady value will be sustained for a period long enough to enable a reading to be made. The supply authorities are concerned about the effect of this steady value for a short duration on other installations supplied from the same feeder. The concern of the electric supply authorities for their customers is legitimate and business like. But the rule that embodies this concern is both unscientific and archaic.

A more scientific and economic method would be to put a restriction on the starting current as a function of a permissible value of voltage dip due to the reactive KVA/HP permissible on this system. Simply put, a 10 HP motor started from a source of a 100 KVA transformer does not cause the same ill effect, when started from a source of a 250 KVA transformer. To apply a common rule, in both the cases, is like using a sledgehammer to kill both a fly and an elephant. But since there are too few elephants in comparison to the flies, the cost of the sledgehammer becomes a wasteful expenditure. In fact, it is possible to eliminate both flies and elephants by the mere application of logic to the formulation of the rules.

By a rough estimate, anything from 20 to 30,000 starting devices are utilised where a simple starting device would suffice. The difference in costs between a simple direct on-line starter and a complicated star-delta starter is anything from Rs 300 upwards. This involves an unnecessary expenditure of Rs 5 million to Rs 10 million every year. This shows our callousness in looking at the existing state of affairs as something incapable of change.

The same rule also forces the use of costlier stepring motors when a more robust form of squirrel cage motor would suffice. It also compels the use of a couple of thousand slipring motors with their consequent costlier starting gear in spite of the fact that they are far more prone to failure than the former.

A comparison with more pragmatic colleagues in the US who have to deal with similar problems, would reveal how they have based their rules and regulations, with singularly better results.

Aerial mains

A consumer is allowed to draw overhead lines to his premises or the electricity board can use overhead lines to the supplier premises. This is not the case in towns like Bombay and Calcutta, but in smaller towns, even in cities the size of Bangalore up to a few years back.

It is a safe guess that the life-span of a majority of so-called weather-proof wires, acceptable under IS Specification 3035, would not exceed two to three years. This, so-called, weather-proof, rubber insulated and braided wire is still in use. A shift to PVC, as the only insulating material may be one of the possible alternatives. Under the present circumstances, a cost benefit analysis of longer life versus use of scarce PVC as an insulating material, is definitely called for. The difficulty is that the rubber insulated and braided weather-proof wire finds it's way to consumers to whom maintenance is least available. In fact, the same story is repeated in the use of electricals throughout the country. The most shoddy and therefore cheap material finds its way to users who have the least capacity to maintain and overhaul. The most modern and durable equipment is chosen by the most advanced in the country who have the most means to maintain and look after what they purchase.

There is a possibility of manufacturing an aerial cable where the supporting wire as well as the conducting wires are PVC covered. This application, with its inherent safety and longevity has not found use so far anywhere in the country.

Power generating systems

All electrical systems are composed of the same basic equipment. Experience has shown that it is most economical to generate power in bulk, transmit at very high voltage to minimise losses and transform it to low voltages for safe feeding to individual customers in small quantities.

The last transformation occurs in the distribution transformers hanging along distribution feeders. Here, the power is transformed to 415/230 volts and fed into the houses (or pump houses) of individual customers. In a perfect system, the voltage at every point along the line remains constant. But the ideal is impossible to achieve because every electrical machine and element is subject to internal voltage drop. This means that voltage, or the voltage that appears across the output terminals of any such electrical device, changes with load.

The output voltage of transformers varies with load conditions too. When a transformer is excited with rated primary voltage, the secondary left open, and a voltmeter placed across the secondary terminals, rated voltage is read on the secondary side. However, as soon as load current, flows through the resistance and reactance of the windings, causing an impedance drop, the voltmeter reads other than the rated voltage.

Lines have series impedance too. A line has resistance and reactance, both capacitive and inductive, distributed all along its length. When the lines are short. the capacitive effect is small and considered negligible. When a sending end voltage is impressed, there is no load on the feeder, the receiving end voltage equals the sending end voltage. However, as soon as load current flows through the line, the current causes a reactance and a resistance drop which subtract from the sending end voltage. giving a resultant voltage on the receiving end smaller than the receiving end voltage.

Mr Kotwal is marketing manager, Siemens India Ltd.

The right equipment for the right job

ETE Transformers and equipment

ETE can cater to varied and "special" requirements of custom-built Transformers and Equipment such as:

- Power & Distribution Transformers
- Neutral Grounding Transformers
- Earthing Transformers
- Furnace Transformers
- Non-inflammable Synthetic Fluid Filled Transformers
- Rectifier Transformers and Power Rectifier Equipment
- Railway Booster Transformers
- Reactors-air cored and iron cored
- Thyristor Controlled Equipment
- DC Power Plants and Battery Chargers

Fig 1 AN INTEGRATED ENERG

Every electrical appliance is designed to operate at a certain rated voltage. The best operation of that appliance is when the rated voltage is applied. A voltage less than the rated voltage when applied to an agricultural pump, adversely affects the operation of the pump. It draws more current thus increasing losses. This is one of the causes of high losses.

The author has described one of the causes of losses, which are phenomenally high by world standards in layman's language. There are other causes, such as low power factor of operating motor etc. To attempt a technical explanation for this phenomena in layman's language may alter the character of this article without gaining in clarity for the reader. Suffice it to say that low receiving end voltages and low power factors are the two principal culprits in what is described as high distribution losses in India.

Rural electrification corporations have done pioneering work in the field and have even taken certain long range and laudable decisions such as to finance capacitor banks at the various rural substations. To undertake this gigantic task the construction of over thousands of substations is certainly a severe strain on the purse-strings of our country.

There seems to be a better alternative, however, which tries to combat both poor power factor and abnormal voltage drop. This problem exists wherever there are long distribution lines such as in Brazil, the United States, the Soviet Union, etc. An optimum solution would be to use a voltage regulator to control the voltage drop and a capacitor bank to improve the power factor.

To complement the usefulness of shunt capacitors, one could also introduce the in-phase voltage control method. If a low voltage is fed into a regulating device, it can be raised to whatever value desired. Regulating devices are voltage sensitive and are usually automatically controlled. The cheapest of these devices is the feeder voltage regulators.

Electrical engineers in the advanced countries, mentioned earlier have endeavoured to solve this problem though a combination of shunt capacitors and feeder voltage regulators which also gave the best cost-benefit ratio. With their forward looking approach and a very wholesome understanding of the problem, it is certain that the Rural Electrification Corporations would also be most willing to try out this optimising method of reducing the distribution losses. In fact, the technology for the manufacture of feeder voltage regulators is not at all advanced and is well within the capacity of Indian manufacturers. The two connection diagrams alongside of the feeder voltage regulator are typical.

Wind and water

The most satisfying news from the energy front has been the Government's proposal to set up a seperate commission for renewable sources of energy—and what more renewable sources can there be than wind and water?

The history of the use of wind power in India is tragic to say the least. National Aeronautical Laboratories had started a department to develop a windmill capable of harnessing wind even at low speeds. During 1960-64 more than 70 windmills were manufactured and erected by the NAL when inexplicably a decision was taken to close down the wind power division of the NAL.

Escorts, it seems have entered into a collaboration agreement with the world famous MAN of West Germany to fabricate and manufacture the AEROHANN windmill. Data are being collected throughout the costal belt of the country to ensure correct locationing of the windmills.

The author suggests that every future lift irrigation scheme should be subject to a no-objection certificate from various decentralised bodies to the effect that a windmill cannot be utilised due to wind conditions prevailing in that particular region where the new lift irrigation scheme is proposed. Abysmal conditions on the energy front would call for drastic measures. The suggestion is not made lightly or without regard for the administrative problems involved. To monitor wind conditions over a long period and to make these observations scientifically reliable i no mean task.

In this connection it migh be interesting to note tha the National Climatic Centre Asheville, N.C., USA, car supply wind direction dat for any part of the country Here, anemometers (a fairl simple devices which) shoulc not cost more than Rs 1,50 each, which record on : counter, at the beginning anc at the end of any period, th average wind speed durin that period, can be used.

Energy transition and international co-operation

By ENIQUE V. IGLESIAS

SCANNING through history, few topics have attracted the attention of humanity as much as has energy. Energy a fundamental issue to all people permeates the fabric of human life with impact on world politics, on international economics and on national development strategies. In recent years, energy has acquired significant importance due to what has been called, with some ambiguity, the world energy crisis. Three important elements characterise this crisis and situate the problem in its correct perspective.

First, at the beginning of the 1970s, it became apparent that fossil fuels, which have been the basis of the energy balance of the modern world, will in the not too distant future be depleted. For the first time, the rate of reserve discoveries and the rate of consumption growth became inverted providing human kind with a realistic perspective based on scientific assessments that depletion could take place during the next generation. This fact drives home to humanity an urgency of attention to energy that has never been felt before.

The second element of this crisis comes from the fact that for the first time in history, an energy transition will be accompanied by higher economic costs. Until recently, people had lived through a period of cheap energy and depressed oil prices. From now on, energy will be available only at higher prices, setting a new challenge of unknown proportions.

Last, the energy crisis has affected humanity in a very unhomogenous manner. The crisis, affecting both industrialised and developing nations, has had a very special impact on the developing countries. These countries will have to go through their process of economic development and modernisation with much higher energy prices than those paid by the industrialised countries. This undoubtedly presents the international community with a problem of equity and solidarity which should stimulate international co-operation.

Possible options

For the first time in human history, the impending world energy transition necessitates that the international community work and debate collectively on possible options. This paves the way for the Conference to initiate activities designed to lead towards a new world energy mix based on a pluralistic and diversified framework of available energy sources than can provide a horizon peace and security. It would be useful to recall here five elements of this energy transition.

The first element is its inevitability. It appears to me that on this topic there is already a commonly agreed point of view. Oil consumption in the world energy mix will continue to play a significant role although of relatively decreasing significance through the end of the century. The demand for oil will be important in the industrialised world where it is expected that the increment in demand will be of the order of 50 per cent and will be four to five times the present demand of the developing world which requires energy sources to accelerate its process of development and growth. All this will occur regardless of conservation or investment policies. At some moment in the next century, it will be even less significant in the world energy consumption pattern making imperative a new energy mix. This is the inevitable challenge facing the industrialised and developing countries collectively.

The second characteristic is that the transition is viable. It is not possible to say today that the world lacks energy resources. That is not the problem. The problem is the potential scarcity of certain types of fuels, mainly the liquid fuels. Experts have told us on several occasions that energy resources do exist, and point out that the real problem is one of investments in technological resources and in production. We also have learned from the reports prepared for the Conference by the technical panels and expert groups that there will no longer be a single alternative energy source as in the past, but instead a mixture of such sources. Our Conference will deal with 14 energy sources as determined by the General Assembly. A UNITAR Conference has identified more than 40 new sources of energy.

A third aspect of this energy transition is that it will be much more complex than energy transition in the past. A complexity due mainly to the fact that humanity has maintained, over many de-

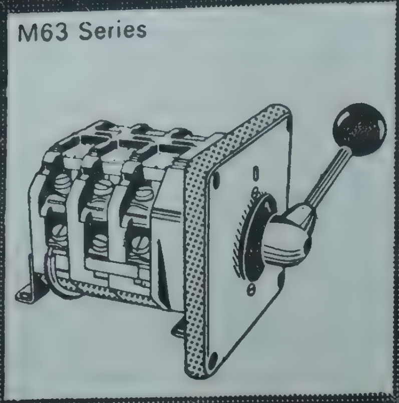
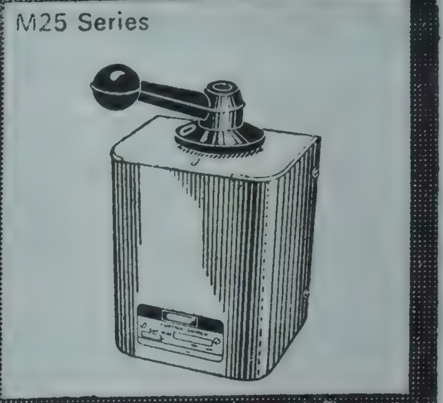
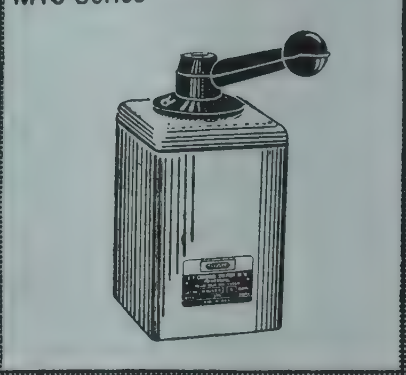
M63 Series



M25 Series



M16 Series



The first choice of renowned original equipment users

M63 Series
L.T. Control. Cam Operated switches. Rating 63 Amps. Versions: On-Off, Star-Delta, Reversing, System-Selector and Programme

M16 Series
L.T. Control switches. Rating 6 and 16 Amps in sheet steel housing with Reversing, On-Off, Change Over sequences

M25 Series
L.T. Control Cam Operated switches. Rating 16 and 25 Amps in open execution and sheet steel housing. Versions: On-Off, Reversing, Star-Delta, System selector, 2 speed pole changing, reversing pole changing and programme

M6 Series
Rotary Cam switches. Rating 6 Amps in open execution upto 12 positions (12 ways)

FS6 Series
Heavy duty foot switches. Rating 16 Amps in 2 and 3 positions with 1NO + 1NC to 4NO + 4NC contact combinations

Rotary Switches
Rating 10 to 100 Amps AC, in 4, 6 and 8 positions in open execution

Tailor-made switches also supplied

cades, artificially low and depressed fossil fuels prices and that the current adjustment has been produced by a process which has complex implications. Over the short term, the problems of balance of payments, imbalances in the energy bill and imported inflation will affect particularly the developing countries who have not even been able to make adjustments by expanding their exports but who are increasing their indebtedness. At the same time, this transition will mean that, economically, higher and higher proportions of investments will have to be dedicated to energy. In the developing world, this will affect the investment requirements for other economic and social purposes.

Degrees of urgency

The fourth characteristic of the energy transition is that it implies varying degrees of urgency. If we accept the messages we have received from the technical panels and groups of experts, involved in the preparations for the Conference, it appears that the world is facing an energy transition which will manifest itself in a different manner for the modern sector of the world economy than for the traditional sector. To the modern sector, the energy transition presents a strong technological challenge to make available a diversity of energy sources. Yet if we follow historical optimism and humanity's achievements over recent decades in the energy field, there would be no room for pessimism: the world, particularly the modern sector, will always find ways to effect an adequate energy transition. On the other hand, a very different situation obtains for the traditional sector basically located in the developing countries. The rural areas of many of these countries are still operating on fuelwood and charcoal and have not yet made the first energy transition. This is an urgent summons, requiring immediate action. The technical panels and the rural energy expert group have dramatically conveyed the pressure that is exerted on natural resources, on the environment and on the forests by this problem. however, because of the special conditions surrounding the traditional sector, it does not necessarily follow that the past scheme of transition from traditional to more modern techniques in more advanced countries could or should be followed by the traditional sector. The complex issues involved demand the attention of the international community if equipable solutions are to be found.

Lastly, I believe that the fifth aspect of the energy transition involves the efficiency in the use of energy as a fundamental element of this transition. This has been noted very clearly by the industrialised countries which in recent years have made very commendable efforts to conserve energy. However, there is still a lot to do to improve the efficiency of primary energy use. When experts tell us that only 15 per cent of the primary energy reaches its end use and that 70 to 80 per cent is lost along the way, this obviously leaves much room for improvement. This is true not only for the industrialised countries but also the developing countries.

The common global interest to increase the energy available should be based on a diversified and sustainable mix especially those which can ensure humanity with a stream of renewable resources for the future. This effort complements a development strategy that will make an active and dynamic contribution to the economic and social development process during the energy transition.

For a wide choice of cables of International Standard there's one choice INCAB

Whatever be the application, whatever be the specification, rest assured INCAB is fully geared to deliver the goods.

INCAB's world encompasses the simplest flexibles for domestic applications; complex electrical and electronic systems for power transmission and industry; and the most sophisticated cables for space projects. All at par in quality and technical perfection to the best in the world.

Sustaining this dedication for excellence is continuous research, development, innovation and the feedback received from the Contracts Department—spanning over six decades.

INCAB's Contract Department is a force by itself with a coveted record in the execution of major electrification projects in India. Today, it's at the fore be it power stations, industrial establishments, railways or city electrification projects.

Little wonder why INCAB's products and services have been the 'choice' for over 35 countries around the world.

Introducing

YULE
heavy-duty
contactors
and relays

The widest range.
The finest performance.
The best value for money.

Andrew Yule, in technical collaboration with Togami Electric of Japan, is now progressively manufacturing the widest range of heavy-duty contactors and relays. Built to meet the most arduous conditions, Yule contactors and relays are of the highest standards and highly dependable in use. The various accessories available go towards making this range one of the most compact, convenient and versatile in the country.

The simple design facilitates easy mounting and ready access to main and auxiliary contacts, resulting in installation economy.

- Available in ratings of 6, 8, 18, 20, 50, 100, 150, 225, 300, 450 and 600 AMPS with three main contacts plus 2 NO and 2 NC auxiliary contacts.
- All contactors conform to the requirements of IS 2959 and IEC 158-1.
- Contactors are light and compact. Dust-proof construction of auxiliary contacts prevents entry of foreign bodies.
- Low cost protection for all applications.
- Main contacts are of silver cadmium oxide. Auxiliary contacts are of silver alloy ensuring long life.
- Self lifting clamps and large pan headed screws simplify cabling.
- Low operating noise.
- Overload relays available in autoreset or handreset with ambient temperature compensating device.
- Relays are available for contactor mounting or individual mounting.

Take your choice from the Yule range. Drop us a line for more information.

Electric Power:
Our nation's finest cables
Our nation's finest motors

Today, Cable Corporation of India has got it all under one roof

With the country's power horizons constantly expanding, we know that you will turn to us more and more for your cable and prime mover requirements. And we have the satisfaction of being able to give you the best... TROPODUR--a synonym for the nation's finest power carriers. Motors manufactured by Bharat Bijlee, under licence Siemens, Germany—the nation's finest prime movers.

Today, our countrywide sales and service network looks forward to meeting your most demanding needs, for we are committed to bringing the same high standards to marketing that we have brought these many years to cable manufacture.

Special Reports

Reviving coastal shipping

BOMBAY

THE state of coastal shipping in the country today is deplorable, according to Mr R. D. Pradhan, director general of shipping. Addressing a meeting on the subject, he said that this was evident from the state of coastal tonnage, traffic and the state of shipping companies which got themselves engaged in coastal operations. Coastal tonnage in 1961 was 3.38 lakh grt, today it is 1.28 lakh grt. Coastal traffic in 1961 was 33.4 lakh tonnes, today it was less than 10 lakh tonnes. There were 17 companies operating in coastal shipping in 1961, today there were only four. Moreover, all coastal traffic was carried at a loss. The Shipping Corporation of India which carried coal on coastal operations, incurred losses of Rs 119 lakhs on these operations in 1974 and Rs 112 lakhs in 1979-80.

Mr Pradhan said the general feeling was that the present state of coastal traffic was due to deficiencies in the trade structure. That was only one aspect of the problem. The unhappy situation in coastal shipping had arisen from two factors: (i) coastal shipping companies had been deprived of legitimate bulk cargo and (ii) there was an uneconomic trade structure. Unless these basic problems were tackled, it would be futile to contemplate the revival of coastal shipping.

It was worthwhile to consider the revival of coastal shipping since India had such a long coastline. For a variety of reasons coastal shipping had lost in competition with road and rail traffic . The present situation had not arisen because coastal shipping was economically less competitive, but because of the uncompetitive conditions in which it was asked to operate.

Mr Pradhan felt that coal, salt, cement, foodgrains and other bulk commodities should be carried by coastal ships and not by the railways as at present. Under the telescopic freight structure applied to railways, the longer the distance, the lower the freight. Telescopic freight rates could not be applied to shipping. The freight per tonne increased with the length of the journey in the case of coastal shipping. The Food Corporation of India wanted to move foodgrains from Kandla to other ports. When it came to organising this transport, it was found that movement by railways would cost Rs 14.71 per quintal and Rs 60 by ship. As long as the rail freight rates did not reflect the real cost of movement by rail, exporters would prefer to move their goods by rail, Mr Pradhan said. In any case the future of coastal shipping would depend on a policy decision to integrate coastal shipping into the overall transport system of the country. There was also a time lag between the increase in fuel prices and freight rates which had to be bridged.

Discussing the prospects for coastal shipping, Mr Pradhan said that by 1984-85, if bulk commodities like coal, salt, cement and foodgrains were moved by ship, coastal traffic would rise to 73 lakh tonnes and by 1990, it could go up further to 122 lakh tonnes. The core of the movement would be coal and salt. The development of coastal shipping would be directly related to the movement of coal; salt could be carried as return cargo. Coal could dominate cargo and about 27 lakh tonnes of coal and five lakh tonnes of salt could be transported by coastal ships by 1984-85.

Mr Pradhan outlined some of the new perspectives which had come up in coastal shipping. One was that most minor ports in the country today were in disuse. Another was that in certain areas of the country, coastal shipping was the only mode of transport as in Lakshadweep, the Andaman and Nicobar islands. The economies of coastal districts were primarily agricultural. Many coastal districts also had vast mineral reserves. Because of the availability of these rich mineral resources, these districts were ideal for location of extractive industries. Coastal shipping and the use of minor ports was one way in which industrial inputs and outputs to these areas could be moved. Mr Pradhan cited some interesting developments in Gujarat, which had a large number of minor ports. There was a scheme for transporting 6.4 lakh tonnes of clinker between Jaffrabad and Magdala. There was another scheme for carrying 3.4 lakh tonnes of clinker from Jaffrabad to Ratnagiri. There was also considerable scope for increasing traffic between Saurashtra and Kandla by moving chemicals. Similarly, there was scope for increasing traffic between Andhra Pradesh and Tamil Nadu. Rice and fertilisers could be moved from Tuticorin to the Godavari delta of Andhra Pradesh.

Bombay spot exchange rates of leading currencies as on 7-9-81

(Currency units per Rs 100)

Country	Currency	Selling T.T.D.D.	Buying T.T. clean
Australia	A. $	9.50	9.70
Austria	A. Schilling	185.00	191.00
Belgium	B. Franc	434	443
Canada	C. $	13.05	13.51
Denmark	D. Kroner	83.20	84.50
France	Franc	63.80	64.90
Hong Kong	H.K. $	65.00	66.90
Italy	Lira	13,360	13,540
Japan	Yen	2510	2560
Malaysia	M. $	25.90	26.70
Netherlands	Guilder	29.40	29.90
Norway	N. Kroner	66.30	67.40
Singapore	S. $	23.70	24.40
Sweden	S. Kronor	57.00	58.00
Switzerland	S. Franc	22.90	23.40
UK	£	5.9960	6.0475
USA	$	10.92	11.12
West Germany	D.M.	26.50	27.00

In the context of these developments, what could be done to make coastal shipping attractive ? According to Mr Pradhan, a package of measures was needed to develop coastal shipping. The time had come when procedures for the revision of freight rates should be revised. A freight rate revisory board should be appointed for the purpose. Similarly the creation of a directorate of coastal shipping was necessary to tie up all cargo movement with shipping companies. On the technical side, a new definition of a home trade ship would have to be found to include ships of less than 300 grt. Moreover, since the problem of customs and documentation was so complex, coastal ships would have to be given green channel treatment. Financial measures would also be needed to attract new investments to coastal shipping. If 57 ships had to be added to achieve the Sixth Five Year Plan target, there was a need for more entrepreneurs. Coastal shipping companies would have to be given the maximum number of loans. Ships over 15 years of age would also have to be allowed to operate on coasts, if some shipping companies operating in international trade wanted to shift to coastal operations.

WOOLLEN GOODS

Export at the cost of domestic consumer?

BOMBAY

THE central theme in the national textile policy insofar as it related to the woollen industry is how to provide cheap woollen cloth to consumers in the country, specially the economically weaker sections, the Textile Commissioner, Mr R. K. Takkar, told members of the Indian Woollen Mills Federation. Yet, most of the organised industry is getting diversified into exports.

Mr Takkar said, the Government did not have a closed mind on licensing further spindleage. It was in the midst of drawing up a policy for units that wanted a capacity of over 2,400 spindles and has decanalised spindleage upto that capacity. This figure was not sacrosanct; if the industry felt the figure was too low, a detailed debate could be held on the subject.

Mr Takkar also emphasised the importance of not placing physical limitations on the use of various fibres by industry. As it is industry had been placed under too many restrictions. He was referring to suggestions made by the federation that restrictions be placed on the use of acrylic and wool by the non-woollen industry. We had to think of ways and means of making industry healthier by not placing restrictions on the use of raw materials by different sections of the textile industry. Acrylic was a new fibre in the textile world and efforts should be made to be true to the multifibre policy. If national priorities required the restricted use of certain fibres, the same could be achieved by fiscal measures, creating tariff barriers rather than placing physical restrictions.

Mr B. K. Kedia, chairman of the Indian Woollen Mills Federation, speaking at the federation's annual general meeting, told the Textile Commissioner that while the decision to liberalise delicensing of worsted and non-worsted spindles up to 2,400 was welcome, this did not help many existing mills. Many good mills were engaged in supplying yarn to the decentralised sectors of hosiery and carpets and in supplying the bulk of the requirements of fabrics and garments meant for domestic trade and exports. The capacity of these mills had been frozen for the past two decades. Today, they had to compete with large resourceful mills from the other textile sectors which had been permitted delicensing up to 50,000 spindles. The federation had, therefore, represented to the Government that all worsted mills should be allowed normal expansion up to 25 per cent of capacity, or up to 4,800 spindles, whichever higher. The non-worsted mills should be allowed expansion up to 25 per cent of capacity, or 2,400 spindles, whichever higher, with the added facility to expand in corresponding loomage. The process of expansion should continue till the woollen mills reached a capacity of 50,000 spindles in line with the other textile sectors.

Speaking about the hurdles in the way of expansion of the woollen industry, Mr Kedia said, the imported machinery required by the industry had become very costly because of inflation in the exporting countries. On top of it there was a 56 per cent duty on imports of such machinery. The federation had asked the Government to place imports of woollen machinery, not available indigenously, under appendix two OGL in the current import policy. This would enable the woollen mills to modernise expeditiously.

Unofficial foreign currency rates in Hongkong

Sri Lanka Rs. (100)	30.00	22.00	
Swiss Franc	2.79	2.74	2.7920
Taiwan $ (100)	15.20	15.00	
Thai Baht (10)	27.50	26.30	

It was also necessary to couple expansion of both the worsted and non-worsted sectors with facilities for modernisation of existing production equipment by allowing replacement of old spindles and looms by new spindles and looms on a one to one basis. The extension of IDBI loans at a concessional rate of interest would be very helpful to the industry.

Mr Kedia said, the woollen mills which had been permitted unrestricted use of man-made fibres for diversifying production, were facing serious and unequal competition in their basic line of production of wool/polyester blended goods. The cotton and art silk mills were permitted to use up to 40 per cent wool in their products. As there was delicensing of capacities in these sectors up to 50,000 spindles, the consumption of wool by these sectors had assumed significant proportions. The Federation had represented to the Government that cotton and art silk mills be permitted to use wool to a maximum limit of 10 to 15 per cent.

Another problem faced by the woollen industry was the use of acrylic fibre by large cotton mills. Acrylic fibre was first introduced by the woollen mills for manufacture of hand knitting wool as a substitute for wool. This line had become one of the major activities of many woollen spinning mills till a few years ago when large cotton mills started encroaching on this line of production, pushing the small woollen mills completely out of production. The federation had, therefore, suggested to the Government that acrylic fibre of 2.9 denier and above and staple length of 1½" should be exclusively reserved for use by the woollen industry. Acrylic fibre below 2.9 denier and staple length below 1½" could be used by cotton and art silk mills.

Mr Kedia spoke about the excessive burden of import and excise duty placed on the products of the woollen industry. The duty content of 55/45 polyester/wool fabric had gone up to Rs 26.06 per per metre as against Rs 26.06 per metre for 67/33 polyester/cotton fabric. The parity between these two classes of fabrics finding outlets in the same markets had thus got disturbed, so that woollen products had begun to face severe consumer resistance.

While welcoming the reduction of duty on imported wool from 75 per cent *ad valorem* to 45 per cent *ad valorem*, the federation regretted that the decrease was more than made up by corresponding rise in the duty on tops as well as on fabrics. The federation also pleaded for a uniform rate of duty on all products which would lead to fair competition between the products of different sectors. There was a heavy fabric duty of 17 per cent *ad valorem* imposed on woollen industry products while a duty of 5.5 per cent was imposed on blended/mixed fabrics manufactured by the cotton and art silk sectors. The burden on all products of the woollen industry had been further increased by a flat rise of 5 per cent on the basic duties under the budget proposals for 1981-82.

The federation had also represented to the Government about the high incidence of excise duty of 30 per cent on machine made carpets which, it was pointed out, were not in competition with handmade carpets. It complained that the excise duty granted to IPCL on the manufacture of acrylic fibre had not been passed on to consumers.

The federation had submitted a scheme to the Government under which indigenous combers be permitted to import duty free wool under the advanced licensing scheme and supply duty free wool tops to valid import licence holders, which should be deemed as exports by them. This would give them an equal opportunity to compete with overseas suppliers. The Ministry of Commerce has recently permitted import of duty-free wool tops to exporters under the advance licensing scheme.

Describing the federation's export efforts, Mr Kedia referred to the successful buyer-seller meet held at Moscow International Hotel in June 1981 in which buying organisations from all over the USSR participated. The USSR buyers showed a significant interest in non-traditional Indian woollen products. The organised woollen industry in India is already exporting to USA, Canada, the EEC and West Asian countries.

At this year's meeting, the federation's award for a unique contribution to the cause of the Indian woollen industry was presented to Mr Babubhai Ravjibhai Goradia of the well-known firm of Babubhai Jagjivandas of Bombay.

Mr Botha escalates war

By A SPECIAL CORRESPONDENT

"IF you want peace, prepare for war"—this is the advice South Africa has followed in firing the first shots in a full-scale invasion of Angola and in pulling down the shacks of cardboard and corrugated iron sheets inhabited by black squatters not far from Parliament House in Cape Town. To outsiders, all this may appear singularly ill-timed. The reopening of the South African Parliament has drawn to Cape Town journalists not merely from Pretoria but the outside world. They have flashed to the world pictures of blacks shivering in cold. During these days, there was a visiting party from the United States of nine members of the American Congress. Some of them were moved to tears when they talked to journalists about the plight of the blacks in face of the heartlessness of *apartheid*. That the US legislators lived world apart from the South African law-makers was proved beyond doubt when a Johannesburg newspaper, known for its support for Mr Botha's government, headlined the news story : "Weepy Liberals". The cold winds of this year's severe Cape winter will not bite the homeless Africans so unkindly as will the brutalities and violence affect the Americans who have seen them at first hand. "The government has gone mad": this is the verdict of the Federal Party MP and veteran liberal, Mrs Helen Suzman, on the events in South Africa.

It is unlikely that the South African Government will be moved towards more civilised conduct by opposition at home or criticism abroad. Dr Koornhof, South African Minister for Development, has announced that his government will "not be blackmailed". If anything, there probably is method in Mr Botha's madness. Presenting his post-election budget against the background of developments "in an uncertain and hostile world", the Defence Minister has stepped up defence spending by 30 per cent. This is not the first year of mounting armed preparedness. Defence expenditure has been pushed upwards by 50 per cent over where it stood some three years ago. This is both heroic and self-defeating when unproductive expenditure must stoke the fires of inflation : in 1980 it was 13.8 per cent and this year's estimate is 14.6 per cent. Add to this the fact that the falling price of gold has already reduced the value of this year's output to some two-thirds of the ore mined in 1980. This has more serious implications for South Africa's external accounts. At the end of 1981, the balance of payments must show a substantial deficit, estimated at present of about £ 2,000 million as compared to the 1980 surplus of some £ 1,800 million.

Mr Botha is in no danger nonetheless, of losing his majority of a hundred in the South African Parliament so long as he shows to black Africans an iron fist. In the earlier years of his premiership, he took care to slip the fist occasionally into a velvet glove. Indeed many enemies of *apartheid* must then have felt they found a new friend in a seemingly liberal Botha who too talked of winds of change and asked his supporters to "adapt or die". Recent months have seen him stalling the implementation under UN auspices of international agreement over Namibian independence, although the major western powers were behind UN Resolution 435. His support for "search and destroy" parties to attack guerilla groups allegedly finding a haven in Mozambique must bring its own armed reaction.

Conceivably the latest invasion of Angola is his ruse to internationalise the war by drawing Cuban troops (now in Angola to help protect, among other security zones, the American investments in oil exploration and export). It is too early to say to what extent Mr Botha has felt encouraged by his own interpretation of Mr Reagan's African policies. There is little doubt that South Africa's armed aggression must destabilise the Angolan Government and cause great uneasiness in Zambia and Zimbabwe. If they feel drawn to the increasingly violent struggle of South African blacks for human rights and self-rule, the primary responsibility will be South Africa's, But Mr Botha must have calculated that he is not alone in asserting racial superiority of whites over blacks and in waging on their behalf a last-ditch war. Which are the powers behind the throne of Botha who has deliberately escalated the war against black Africans at home and abroad ?

The controversial Farooq Abdullah

From O. N. KOUL

SRINAGAR

IF the 46-year old eldest son of the Chief Minister, Sheikh Abdullah, Dr Farooq Abdullah, MP, has received an unqualified support from the rank and file of the ruling National Conference of which he was ceremoniously installed as the new president here on August 21, he has also invited adverse comment for his suggestion that the Congress (I) wind up its establishment in Jammu and Kashmir.

However, there is nothing new in this demand. Immediately after returning to power in February 1975, Sheikh Abdullah exchanged several letters with the then state Congress boss, Syed Mir Qasim, on the subject but the latter firmly rejected the idea that the concerned people operate from the common platform of National Conference which was duly revived in 1976. What the Sheikh had in mind and what his son now dutifully appears to think is that the National Conference should regain the status of an associate party it had with the Indian National Congress in and outside the Parliament till the latter inducted its units in to the state, for the first time, in January 1965.

In holding this view, Dr Abdullah does not only believe that his party and the Congress (I) have an identity of ideals but also wonders what considerations govern the latter in opposing a return to the pre-1965 organisational arrangement especially when the late Prime Minister, Mr Jawaharlal Nehru, had categorically stated in his letter of September 20, 1963 to the then State Premier, Bakshi Ghulam Mohammed, that the Congress had been closely associated with the National Conference in Jammu and Kashmir and could not, therefore, encourage any new organisation "even though it called itself the National Congress".

Retail prices of essential commodities in Bombay

Compiled by Commerce Research Bureau

Item	Quality	Rs per kg				Percentage variation on Sept. 4, 1981 over		
		Sept. 4, 1981	Aug. 28, 1981	Aug. 7, 1981	Sept. 5, 1980	A week ago	A month ago	A year ago

Dr Abdullah may have adequate reasons to think the way he does. He may also tend to believe that the present Congress (I) leaders have some unfounded suspicions. But, he cannot ignore the fact that the induction of the Congress into the State took place under the guidance and with the approval of Mrs Indira Gandhi who, of all persons, could not be expected to take kindly to a "quit notice" after an interval of 16 years. In any case, Dr Adbullah should have realised that the Congress (I) was the only organised and effective opposition party in and outside the state legislature and as such had a very valuable role to play in the professed democratic order. Fears repeatedly expressed by Sheikh Abdullah in recent months in the wake of an aggressive campaign against him by Congress (I) leaders, including Mrs Gandhi, that the ruling party at the Centre was out to dislodge him by fair or foul means were allayed by the Prime Minister herself here recently when, in fact, she defused the situation in favour of the National Conference at the cost of the morale of her own partymen. Not that the state Congress(I) leaders have given up their mistrust of the Sheikh. But, they assert that they are the only link with the Centre in the prevailing circumstances and have, therefore, an aditional responsibility of being truly functional in Jammu and Kashmir.

It is difficult to believe that Dr Abdullah did not expect the criticism that has come for his anti-Congress suggestion. That he did not refrain from doing so is explained by some observers by pointing out that the National Conference has the chronic habit of taking extreme positions, as and when necessary, to rouse sentiments. According to these observers, in saying what he did, Dr Abdullah projected himself as bold as his father in taking a stance which smacked of resisting New Delhi. They add that the stance could be deliberate in the context of general belief that assembly election will be held in the state next year instead of the scheduled date of June 1983. Does it, therefore, mean that Dr Abdullah's statement was meant only for local consumption? If so, will not the same hold good for the critical references made earlier by the Sheikh himself to the Centre on the issue of granting permission to the residents of occupied Kashmir to visit this side and vice versa?

However, if it is chronic with the National Conference to take extreme positions, its attitude towards the press is pathetic. Addressing the party delegates on August 23, Dr Abdullah expressed satisfaction at the coverage given to the speeches delivered by him and his father on August 21 but took strong exception to "miserly treatment" given to the 7-km presidential procession taken out earlier on that very day. "The tide makes no distinction. It will sweep you away", he roared at the newsmen. There is no doubt that the procession was spectacular. Equally spectacular were the illuminations and the fireworks which preceded and continued till the National Conference-annual session ended. Was the press expected to fill columns about it by, say, comparing it with the recent royal wedding celebrations in London? Dr Abdullah should be grateful if the press did not point out that the people's involvement in his presidential procession was not as impressive and widespread as was the case in the 1977 mid-term election or earlier in 1975 when Sheikh Abdullah visited the valley immediately after assuming the office of Chief Minister in Jammu in terms of the Kashmir Accord. The people concerned had better realise that it is one thing to ask press to be fair and constructive and absolutely another to tell newsmen, directly or indirectly, what they should write.

What exactly he does will be known only with the passage of time. But Dr Adbullah, a young man of excellent manners, tall, fair and handsome, enjoying the patronage of his illustrious father, the unchallenged leader of the state people, should be expected to cure whatever is known to be chronic and pathetic about his party.

FICCI pleads for higher growth

MADRAS

THE executive committee of the standing advisory committee of the Federation of Indian Chambers of Commerce and Industry (FICCI) met here last week under the chairmanship of its president, Mr Arvind N. Lalbhai. Meetings of the sub-committees of taxation, foreign trade, internal trade, energy and rural development were also held.

The committee noted with satisfaction that the economic situation, particularly since the last one year had significantly improved due to efforts made by the Government in major areas like power generation, and coal production and movement. Industrial production, on current indication, is increasing at the rate of 10 per cent per year. The committee hoped that this growth will be maintained. It, however, feared that a section of industry may be forced into sickness for lack of adequate working capital and it is imperative that credit

As I see it

Small industry "promotion"

IT is the policy of the Government of India to promote the development of small scale industries. The normal expectation under the circumstances would be that the public sector undertakings would be actively involved in the effort to help the growth of the small scale industries. The facts do not, unfortunately, stand up to this expectation. Many of the public sector undertakings are found to be lukewarm to the small scale units inspite of the number of guidelines issued by the Bureau of Public Enterprises in the Union Ministry of Finance. Indeed in nearly 30 out of the 100 public sector undertakings, which have scope for ancillarisation, plant level committees for ancillary development programmes have not been set up. The complaints have been voiced that many of the public sector undertakings suddenly change specifications and do not place orders for their requirements, often delay in inspecting the products and the payment of the bills for supplies made by the small scale units.

During 1979-80, 66 manufacturing public sector enterprises procured from the small scale unit items worth Rs 119 crores—less than ten per cent of the outside purchases by these public sector undertakings. It would not be correct to put the entire blame for the low purchases from the ancillaries on the public sector undertakings in the absence of any study on the range of items that can be purchased by them from the small scale sector. Between 1975-76 and 1979-80 the number of ancillaries serving the public sector enterprises went up from 479 to 888 and the value of purchases by the public sector enterprises from the ancillaries registered an almost fourfold increase.

The Government has been a silent spectator to the undercutting of the small scale units by the large manufacturers in more ways than one. In some cases the large manufacturers charge relatively higher prices from the small scale units on raw materials and intermediary products purchased by the latter. This is done to reduce the price competitiveness of the products of the small scale sector. In other cases the large units adopt the practice of undercutting the prices of small scale units to push them out of the market.

The Small Industries Service Institutes (SISIs) maintain 16 exchanges for the purpose of effecting linkages between small scale units and large and medium undertakings in the matter of subcontracting of part of the job undertaken by the latter. The functioning of these exchanges leaves much to be desired. During 1979-80 no subcontracting was arranged by the exchanges at Jaipur and Srinagar, while that in Patna handled business worth only Rs 38,000 and that in Madras business worth just Rs 44,000. The fact is that only a small number (8,100 units out of a total of over eight lakh small scale units) in the country are registered with these exchanges.

Nearly 843 items have been "reserved" to be produced by the small scale sector exclusively. In practice many of the so-called "reserved" items are still being produced by the large units including multinational companies. Toothpaste was reserved for the small scale sector in 1970. Notwithstanding such reservation nine organised sector units with the total approved capacity of 3,927 tonnes had increased their production of toothpaste to 9,400 tonnes by the end of 1978. Just the opposite was the picture in the small scale units numbering nine whose production in 1978 was just 740 tonnes—less than one sixth of their installed capacity of 4,700 tonnes! This is how "reservation" operates in relation to the small scale units.

Subhash Chandra Sarker

Money

Much delayed cheque realisation

THE amount of troubles that large companies and corporations face regarding their local and outstation cheques deposited with banks are immense. Everyone knows by this time that realisation of cheques takes a long time in banks. Even local clearing cheques take a long time. Neither drawers nor payees have an assurance that their cheques will be paid or collected within the expected time range. In metropolitan cities like Bombay or Calcutta even local clearing cheques take three to four days if both the banks are concerned in suburbs. Banks receive clearing cheques for payments late in the evening and often they keep them pending till the next morning before passing. Very often cheques are turned long past the return time. Above all, the collecting banks take weeks to send back to the depositor cheques returned through clearing.

Thus by the time a depositor receives back the cheque deposited by him in his bank, it is usually 15 days. Most of the time, collecting banks do not read the objection memos and do not represent the cheques even if the paying banker has specifically stated "effects not cleared", or "present again".

It has been usual with most customers not to sign the cheques and with most bankers to certify "payees account will be credited". Often the customers forget or fail to sign and the bankers fail to give the stamped certificate. Recent modifications in clearing house rules provide that even if there is no specific certificate to that effect, the clearing stamp of the bank will be tantamount to such a certificate. Yet many bankers return clearing cheques with such technical objections.

These are the problems which most customers face in one way or another, at one end or another. But these problems are compounded hundredfold where the customer is another bank or financial institution, which has given loans and which has to credit the cheques to the loan accounts of their customers. They find that there is no finality about realisation of cheques deposited in a bank for clearing purposes. They, therefore, go to another extreme of withholding credits to their borrowers for 15 to 25 days, until they are absolutely certain that a clearing cheque can no longer come back now !

Not only others, even banks themselves follow this practice. Give a clearing cheque to a bank for payment to government; it will ask for a "cooling" period of 10 days before the receipted *challan* is issued. The entire automaticity in the clearing operations of the banks, and the time discipline in their clearing operations have been lost or replaced by problems, delays and indifference. No one, not even banks rely on the results of their own clearing. Whatever may be the sophistications introduced in banking services, in this elementary task of clearing cheques, banks are not reliable or accurate.

If this is the state of affairs in clearing of cheques, the problems are worse in outstation collection of cheques and bills. The realisation advices do not come, even if they are received, they are not credited, and even where they are credited, the credit advices are not issued.

In cases of financial institutions which have to give credit to their customers' loan accounts, such uncertainty about outstation cheques for months together is very damaging. Since they do not know which of their cheques are realised and which are not, they are unable to give to their own borrowers a clear picture of their own ledger accounts. And the troubles continue at all levels. Pharmaceutical and consumer goods companies cannot credit their depots and sales dealers and cannot supply goods. Money and balances are locked up at all stages and in all offices. And such lock-ups go to raise the cost of money to all, including consumers.

S. G. Shah

---

needs of industry be maintained to keep production expanding.

It is the considered view of the committee that a number of commodities are currently imported at considerably higher prices than the domestic cost of production. In fertilisers, the domestic price is half that of import price, in cement only a little above one-third, and in paper about 40 per cent. Import of these and other commodities such as edible oils, iron and steel, aluminium, synthetic fibres and chemicals would cost Rs 2,500 crores. These could be indigenously produced and the import bill reduced to that extent. In fact, many of these may be good export items. Self sufficiency in these commodities could be achieved through investment of Rs 3,400 crores. Unless this is done India's trade prospects would remain bleak.

The committee urged that the time involved in the implementation of projects should be cut down drastically and investment be made attractive enough. The time taken for clearance of applications for industrial licences, MRTP approval, issue of import licences and sanction of loans by financial institutions was quite long. To reduce the delay, Government should create a "single window facility" which would take a final decision on all these aspects.

While pleading that investment be made really attractive, the FICCI pointed out that in many of the controlled industries, the level of prices did not permit a return of 15 per cent which is the interest industry had to pay on its borrowing from financial institutions. Moreover, the escalation of cost of new projects due to inflation made it impossible for them to compete with established industries. This handicap could be removed by reintroducing the excise duty rebate scheme which was in operation during 1976-79. The committee appreciated the Government's decision to revise cement prices.

The committee felt that the present system of depreciation based on historical cost made it impossible for companies to replace worn-out plant and machinery and often lad to industrial sickness. It was, therefore, suggested that the retention of resources through depreciation and other facilities like investment allowance should be such as to bring up the resources to match replacement value of plant and machinery.

The FICCI decided to organise a workshop on tourism in Delhi on September 30. It will be inaugurated by Union Minister for Transport and Tourism, Mr A. P. Sharma.

Doubly Deadly

Shelltox®

2-in-1 Household Insecticide

knocks down mosquitoes dead, and kills cockroaches, bed-bugs, ants.

Shelltox—the most powerful 2-in-1 insecticide
Shelltox contains two powerful insecticides—one has a quick, knock-down-dead effect on flying mosquitoes and insects. The other has a longer-lasting, persistent effect that kills cockroaches, ants, fleas, bed-bugs, etc.

Shelltox comes ready-for-use
Shelltox is safer since you do not have to mix it before spraying. Just pour Shelltox into your sprayer. Close all doors and windows and start spraying. First into space, then behind furniture, curtains, beds—wherever cockroaches and insects hide in the house. Then leave the room and keep it closed for 15 to 20 minutes.

Shelltox is available in ½ litre, 1 litre and 5 litre tins from leading stores and chemists.

INDO-AUSTRALIAN TRADE

Exploring new areas

BOMBAY

POLITICAL and traditional links between India and Australia are close, but trade links are poor, Mr J. B. Gough, leader of a high powered seven-member Australian delegation to India told members of the Bombay Chamber of Commerce and Industry. Only one per cent of Australia's exports come to India, and only one per cent of its imports of Rs 180 billion come from India.

The Australian Trade Development Council survey mission has, therefore, come to India in the wake of the Australian Prime Minister, Mr Malcolm Frazer's recent visit to this country to explore possibilities of stepping up trade between the two countries.

Mr Gough described some of the advantages of trade with Australia. About 70 per cent of Australia's imports went in duty free 20 per cent at duty rates up to 30 per cent and the final 10 per cent was protected. The Australian Government had embarked on a plan of reducing tariffs in the last decade, when it reduced tariffs by 30 per cent. Only some items like clothing, footwear and textiles were placed under protection and that might affect trade with India. But developing countries were given a preference of 10 per cent. The 10 per cent preference, however, was not allowed if products reached 15 per cent of the import market. This meant that India's competitors like Taiwan and South Korea would probably not get the 10 per cent preference.

Mr Gough expressed the delegation's tremendous desire to find an Indian manufacturer willing to export a product to Australia which would find credibility in the market. India today was what Japan was 25 years ago. A number of goods like textiles, automobiles and sports articles like wooden tennis rackets and hockey sticks could be exported to Australia. Australia was a highly competitive and fashion conscious market. If the market there could be captured, it would be a wonderful passport to enter the US market. The Japanese experimented with the Australian market before penetrating the US market he pointed out.

It was clear that the Australians did not know much about India nor Indians about Australia. The latter could only learn about Australia by sending entrepreneurs to visit the country.

CORPORATE SECTOR

In the market

Uptron Electronic Devices

Uptron Electronic Devices Ltd (Registered office: 64/2, Site IV, UPSIDC Industrial Estate, Sahibabad-201 005, District Ghaziabad, Uttar Pradesh) is offering for public subscription at par 4.90 lakh equity shares of Rs 10 each totalling Rs 49 lakhs. The subscription list will open on September 16 and close on September 26 or earlier but not before September 18.

The company, incorporated in October 1979, is setting up a project at Sahibabad for the manufacture of 1.85 million each of aluminium electrolytic capacitors and polystyrene capacitors per annum. The trial runs are scheduled to be made in November 1981 and commercial production shortly thereafter. The total cost of the project is estimated at Rs 2.54 crores which will be financed by equity share capital of Rs one crore, term loans of Rs 1.46 crores and unsecured loans of Rs 8 lakhs from private Indian promoters.

Uptron Electronic Devices Ltd is a joint venture of Uttar Pradesh Electronics Corporation Ltd, L. M. Ericsson Telephone Company, Sweden, and Messrs S. R. Jiwarajka and P. Obul Reddy and their associates.

Morarjee Goculdas

The Morarjee Goculdas Spg & Wvg Co Ltd, Dr Ambedkar Road, Parel, Bombay-400 012, is offering for public subscription at par 2.50 lakh 13.5 per cent secured debentures of Rs 100 each totalling Rs 2.50 crores. The subscription list will open on September 14 and close on September 24 or earlier but not before September 16. The company, incorporated in August 1871 for the manufacture of textile goods, wishes to augment its resources through the debenture issue.

Kirloskar Brothers

Kirloskar Brothers Ltd (Registered office : Udyog Bhavan, Tilak Road, Pune-411 002) is offering for public subscription at par 1.50 lakh 13.5 per cent secured redeemable debentures of Rs 100 each totalling Rs 1.50 crores. The subscription list will open on September 14 and close on September 24 or earlier but not before September 18. The company was incorporated in January 1920 for the manufacture of agricultural implements and machinery. The object of the present issue is to augment the resources of the company.

Tristar Concrete Industries

Tristar Concrete Industries Ltd (Registered office : 231/H, Rai Bahadur Road, Calcutta-700 034) is offering for public subscription at par 2.10 lakh equity shares of Rs 10 each totalling Rs 21 lakhs. The subscription, which opened on September 11, will close on September 26 or earlier but not before September 15. The company was incorporated as a public limited company in May 1981 for manufacture and trading of RCC Spun pipes and concrete products.

Other developments

GIIC: Hotel project in Baroda

Gujarat Industrial and Investment Corporation Ltd has signed an agreement with Mr Mahendra Patel of GEAP Group, a company based in United Arab Emirates which has its business interests in other parts of the world as well, for setting up a hotel and housing project in the joint sector in Baroda city.

The estimated outlay for the hotel project would be about Rs 3 crores although the details in respect of the exact number of rooms and types of facilities to be provided are being worked out. The hotel will be located at RC Dutt Road, Baroda. The housing project envisages construction of 600 luxury flats for non-resident Indians in Alkapuri, Baroda. Each flat is estimated to cost Rs 6 lakhs which will have to be bought against the payment in foreign exchange. The implementation of the projects will commence shortly.

Kunal Engineering: Expansion apace

Kunal Engineering Ltd has reported higher turnover for the year ended March 1981 at Rs 5.85 crores compared to Rs 3.97 crores in the previous year. The net profit, after providing Rs 20.82 lakhs (Rs 15.72 lakhs) for interest payments and Rs 24.06 lakhs (Rs 16.78 lakhs) for depreciation, was Rs 48.69 lakhs (Rs 52.83 lakhs). The equity dividend recommended for the year under review is 24 per cent (20 per cent). An amount of Rs 12.16 lakhs (Rs 27.72 lakhs) is tranferred to investment allowance reserve and Rs 16.68 lakhs (Rs 2 lakhs) to general reserve. Production of spindles during the year under review was 7.15 lakhs numbers (6.29 lakh numbers) and that of inserts was 4.36 lakh numbers (30,000 numbers). Expansio project for spindles and inserts to 9 lak numbers each per annum is progressin well.

Laxmi Starch steps up

Sales of Laxmi Starch Ltd for th year ended March 1981 increased to R 15.37 crores from Rs 10.30 crores in th previous year. The net profit, after pro viding Rs 20.42 lakhs (Rs 19.76 lakhs for depreciation and Rs 49 lakhs (Rs 1 lakhs) for taxation, amounted to R 29.66 lakhs (Rs 20.93 lakhs). The equit dividend recommended for the year under review is 15 per cent (12 per cent) An amount of Rs 1.70 lakhs (Rs 2.5 lakhs) is transferred to investment allowance reserve and Rs 15.92 lakhs (Rs 12.5 lakhs) to general reserve.

Enfield India : Losses cut

Enfield India Ltd has reported higher turnover for the year ended June 1981 at Rs 31.95 crores compared to Rs 22.97 crores in the previous year. The net profit, after providing Rs 1.12 crores (Rs 1.10 crores) for finance charges and Rs 28.05 lakhs (Rs 25.76 lakhs) for depreciation, was Rs 1.32 crores (Rs 71.14 lakhs). The accumulated losses has been brought down to Rs 66.81 lakhs from Rs 2.05 crores in the previous year. The accumulated losses stood at Rs 3.58 crores at the end of 1977-78. Output of bullet motorcycles during the year under review was 19,512 units (16,180 units) and that of mini-bullet motorcycles was 4,866 units (2,682 units). The modernisation programme is estimated to cost Rs 2.87 crores which will be financed by term loans of Rs 2 crores and Rs 87 lakhs from internal resources.

L & T : Ambitious diversification

Larsen and Toubro Ltd will invest an additional Rs 200 crores in a cement plant, shipping and further expansion of its activities. Disclosing the company's future plans at a press conference, the chairman, Mr N. M. Desai, said L & T was also thinking of taking up projects such as caustic soda, metallurgy and sponge iron.

There will be a capital investment of about Rs 80 crores in the cement plant with a licensed capacity of 1.1 million tonnes and likely to be commissioned by February 1983. For its shipping business, L & T will acquire four bulk carriers — one next month and the second in January 1982, both being second hand. Early in 1982, the company plans to place orders on overseas hipyards for the remaining two ships. It has also applied to the Monopolies and Restrictive Trade Practices Commission for clearance of the proposal to acquire bulk carriers totalling 180,000 dwt. The capital outlay is expected to be Rs 70 crores.

The company has had higher profitability this year due to better capacity utilisation ranging from 70 to 95 per cent for most units resulting in better productivity. Sales for the first four months ending July 31, 1981 totalled Rs 54 crores against Rs 36.54 crores during the corresponding period for the previous year. Production rose to Rs 42.78 crores from Rs 29.10 crores. Order booking as on July 31, 1981 was Rs 77.61 crores compared to Rs 41.58 crores a year ago. Order backlog is Rs 155 crores compared to Rs 117 crores for the previous year.

L & T will soon have a Bahrain subsidiary. The company will be formed on a joint venture basis with Consolidated Contractors International Company Limited (CCICL) Liberia, which will hold 25 per cent of the total share capital of Rs 100 lakhs. CCICL is a leading construction and engineering company operating in the Middle East. The L & T subsidiary, Engineering Construction Corporation (ECC) is, together with CCICL, executing a contract for mechanical equipment erection and piping works for the crude process unit in Zirku, UAE. ECC has also secured a large order valued at Rs 40 crores from Iraq for the construction of police headquarters in Baghdad. ECC is executing two earlier contracts in Iraq, together valued at Rs 26 crores. The total value of overseas orders including orders from Abu Dhabi and Sri Lanka currently under execution by ECC stands at Rs 6 crores.

LM-Maneklal: Good export erformance

Sales and other income of SLM-Maneklal Industries Ltd for the year nded March 1981 increased to Rs 23.11 crores from Rs 19.80 crores in the previous year. The net profit, after providing Rs 48.09 lakhs (Rs 46.44 lakhs) for depreciation and Rs 17.60 lakhs (Rs 3.75 lakhs) for taxation, amounted to s 66.47 lakhs (Rs 69.75 lakhs). The quity dividend recommended for the ear under review is 14 per cent. An mount of Rs 25.68 lakhs (Rs 18.02 lakhs) is transferred to investment allowance reserve and Rs 3 lakhs (Rs 13 lakhs) general reserve. Exports during the ear under review were Rs 1.04 crores s 40.19 lakhs). The company has on and export orders for over Rs 1.60 crores. The plant for the manufacture of high pressure rubber hoses at Kalol, Panchmahals District, Gujarat, in technical collaboration with Tecalemit Flexibles, France, has been successfully commissioned in March 1981. The company, along with the Standard Mills Co Ltd, Bombay, is participating in a joint venture project being set up in Indonesia for the manufacture of cots and aprons for the textile industry and other rubber products.

Gwalior Rayon recommends 20 per cent

The Gwalior Rayon Silk Mfg (Wvg) Company Ltd has reported a higher turnover for the year ended March 1981 at Rs 295 crores compared to Rs 247 crores in the previous year. The net profit, after providing Rs 7.92 crores (Rs 7.42 crores) for depreciation and Rs 7.38 crores (Rs 6.83 crores) for taxation, was Rs 9.15 crores (Rs 7.17 crores). The equity dividend recom-

Tuticorin Alkali Chemicals plant nearing completion

Tuticorin Alkali Chemicals and Fertilisers Ltd, a joint sector project sponsored by Tamil Nadu Industrial Development Corporation Ltd (TIDCO) is fast taking shape at Mullakadu village, near Tuticorin, in Tamil Nadu for the manufacture of soda ash (a basic chemical) and ammonium chloride (a nitrogenous fertiliser). The plant will have an installed capacity of 66,000 tonnes of soda ash and 66,000 tonnes of ammonium chloride per annum. Construction work had started in June 1979 and the plant is expected to go on stream in early 1982.

TAC has entered into a contract with Hitachi Shipbuilding and Engineering Company Limited, Japan, popularly known as Hitachi Zosen, for the supply of process know-how, design and detailed engineering of the project, apart from supply of machinery and equipment, all valued 2,169 million yen (Rs 8.58 crores).

The cost of the project is Rs 53.20 crores which is proposed to be met by equity share capital of Rs 13 crores and Rs 40.20 crores by way of loans from financial institutions. TIDCO's participation in equity share capital will be Rs 643 lakhs, SPIC's Rs 20 lakhs and the balance of Rs 6.37 crores would be offered to the public.

Current production of nitrogenous fertiliser in India is 2.20 million tonnes as against a demand of 3.50 million tonnes. Projections for 1984-85 are for six million tonnes and a supply of 4.20 million tonnes.

Construction work in progress at the TAC project site.

mended for the year under review is 20 per cent. An amount of Rs 1.98 crores (Rs 1.45 crores) is transferred to investment allowance reserve. Production of pulp during the year under review was 97,797 tonnes and that of caustic soda was 39,536 tonnes. The turnover of Bhiwani Textiles during the year under review increased to Rs 28 crores from Rs 22 crores in the previous year. During the year under review, the company exported goods worth Rs 1.10 crores comprising chemicals, machinery, etc.

Piramal Steel: Increased sales

Sales turnover and other receipts of Piramal Steel Ltd for the year ended April 1981 increased to Rs 6.01 crores from Rs 3.73 crores in the previous year. The net profit, after providing Rs 6.95 lakhs (Rs 5.65 lakhs) for depreciation, was Rs 32.90 lakhs (Rs 32.08 lakhs). The equity dividend recommended for the year under review is 10 per cent. An amount of Rs 2.50 lakhs (Rs 0.33 lakh) is transferred to investment allowance reserve.

The company proposes to establish a sophisticated rolling mill for which the requisite letter of intent had been obtained. The first phase of the project is likely to be completed during the latter half of 1982.

Investment Corporation: Increased income

The Investment Corporation of India Ltd has reported higher gross income for the year ended March 1981 at Rs 1.08 crores compared to Rs 1.07 crores in the previous year. The net profit, after providing Rs 20.24 lakhs (Rs 9.80 lakhs) for taxation, was Rs 52.96 lakhs (Rs 66.73 lakhs). The equity dividend recommended for the year under review is 20 per cent (same). An amount of Rs 55 lakhs (Rs 5.10 lakhs) is transferred to general reserve.

HDFC's maiden dividend

Housing Development Finance Corporation Ltd has made considerable progress during the year ended June 1981. Total loan approvals have exceeded Rs 61 crores for 24,000 homes in 185 towns and cities throughout the country. The net profit, after providing Rs 53.75 lakhs for taxation, was Rs 1.14 crores. The company has declared a maiden dividend of 5 per cent for the year under review. Dnring the year under review, the company approved loans totalling Rs 31 crores and disbursed Rs 22 crores.

Indian Explosives: Turnover up

Indian Explosives, a fertiliser and blasting explosives company, has earned a turnover of Rs 62.32 crores during the first six months of the year ending September 1981 compared with Rs 37.03 crores during the same period the previous year. It is interesting to note that during the year ended September 30, 1980, the company's sales totalled Rs 68.15 crores.

The estimated trading profit for the half year comes to as much as Rs 7.41 crores, as against Rs 3.05 crores during the corresponding half year of the previous working year and only Rs 2.13 crores for the whole of the working year ended last September. A record rise in the sales of fertilisers to Rs 41.37 crores against Rs 20.02 crores and Rs 30.05 crores for a full working year ended September 1980, has contributed to the spectacular rise in the sales for the half year under review. The company's fertiliser expansion project which increases the existing capacity by 50 per cent was completed in record time.

Despite this excellent performance, the company has not declared an interim dividend, and also despite the fact that tax allowances like depreciation and investment allowances available for the fertiliser expansion project take the entire tax liability away. The company is really worried by the increase in the interest burden on account of heavy working capital borrowings.

Tata Oil Mills: Bonus issue proposed

The Tata Oil Mills Company Ltd has reported higher income for the year ended March 1981 at Rs 150.54 crores compared to Rs 105.95 crores in the previous year. The net profit, after providing Rs 4.54 crores (Rs 3.01 crores) for interest payments, Rs 1.19 crores (Rs 1.14 crores) for depreciation and Rs 2.37 crores (Rs 1.81 crores) for taxation, amounted to Rs 2.40 crores (Rs 1.52 crores). The equity dividend recommended for the year under review is 20 per cent (same). An amount of Rs 17 lakhs (Rs 12 lakhs) is transferred to investment allowance reserve and Rs 1.23 crores (Rs 46.87 lakhs) to general reserve. The company proposes to issue 1:5 bonus shares subject to necessary approvals. The bond-holders who have opted to convert the convertible part of the bonds into ordinary shares will also participate in the bonus issue.

Similar adjustments are sometime the items also. Totals may not add up due to rounding off.

EQUITIES

Feeble recovery

Bombay, September 7

After a subdued spell, pivotals staged a feeble recovery on emergence of short-covering and replacement support at the lower levels during the past week. Price movements were generally small in the absence of any significant buying or selling. In a few cases, however, price variations were large. Activity was restricted and the undertone at the close of the week was barely steady. The market was open for trading only for two days, namely, on September 1 and September 4 on account of intervening holidays.

Century staged a smart rally from the week's low of Rs 795 to Rs 809 before closing at Rs 808, with a small net gain of Rs 2.50. Standard sought a lower level at Rs 508. The scrip also recovered strongly to Rs 515. However, on balance, it yielded five points. Khatau, Morarjee, Bombay Dyeing, G.E. Shipping, Scindia, Gwalior Rayon, PAL and Tata Oil lost small ground.

TELCO suffered a setback on reports that certain bond holders had approached the Controller of Capital Issues against the management's adjustment price of Rs 64.29 following the proposed bonus issue of two-for-five. The bondholders' contention was that they should get Rs 90 per share of Rs 225. According to the company's adjustment price, the bondholders would stand to lose Rs 5 crores out of their capital contribution, the bondholders have argued. The scrip came down to as low as Rs 574 from Rs 606. The closing was, however, at Rs 596 with a marked loss of 10 points.

Voltas, however, firmed up by eight points to Rs 209 on informed buying. NRC also hardened by Rs 5 to Rs 355. Tata Mills, Tata Chemicals, Larsen, Tata Steel, ACC, Amar Dye-Chem and Indian Dyestuff ruled steady-to-better.

In the cash section, Bajaj Auto continued to encounter heavy selling on uneasy labour situation at its Pune plant. The scrip was marked down further by Rs 105 to Rs 1,370. The other major losers were Dempo Steamship, MICO and Kenetic, dipping by Rs 30 to Rs 470, by Rs 12.50 to Rs 447.50, by Rs 6 to Rs 102 and IOC by Rs 9.25 to Rs 307. Century Enka recorded a useful gain of Rs 5 at Rs 660 on replacement support.

Market Gossip

Shipping dividends

THE Shipping Development Fund Committee (SDFC) is apparently trying to be strict with the dividends of the shipping companies which might have taken additional loans or defaulted in respect of instalments or interest of the loans taken from the Committee. In the case of Ratnakar Shipping, it has rejected the proposal of the directors for a 10 per cent equity dividend, and Chowgule Steamships, which had taken a fresh loan of Rs 8 crores from the SDFC, has been asked to reduce its dividend from 15 to 10 per cent. The SDFC, in making its decision known advances no reasons for it. But in the case of Ratnakar Shipping, there would appear to be some default in repayment of the loans and in the case of Chowgules, the argument would seem to be that if the SDFC had not extended a loan of Rs 8 crores, even with the upturn in the freight market and the company doing well in the 1980-81, there would not have been that liquidity surplus to declare a 15 per cent dividend. The SDFC, under the conditions it lays down for loans, requires that a shipping company should take its prior permission before paying a dividend which the directors may have recommended. Even in the case of a shipping company which has not taken recently a loan from it, the SDFC stipulates that its prior permission will have to be obtained before declaration of a dividend above 20 per cent.

Blade war

MALHOTRAS, who manufacture the Topaz and other brands of blades and reportedly enjoy 80 per cent of the Indian market for blades, and Wilkinson Sword Ltd of the UK are involved in a blade war. Wilkinson is setting up in collaboration with Asian Cables and Karnataka State Industrial and Investment Corporation a Rs 10-crore project in Mysore, which is expected to produce about 40 million blades and 10 million shaving systems during 1982-83. The plant expects to reach its full capacity of 150 million blades and 20 million shaving systems in about three years after it goes in production in the middle of next year.

Malhotras are obviously disturbed by this development and ran an advertisement campaign in newspapers to say that 'Wilkinson of England bought our blade machinery'. This has brought a retort from Mr Donald Jack Kemp, technical director of Wilkinson Sword, that the claim was baseless and the Wilkinson had imported some equipment from Malhotras in line with the practice to evaluate the performance of the blade machinery manufactured by other companies in the field. This machinery was never used by Wilkinson. Malhotras point out that it was Mr Kemp himself (then works director of Wilkinson), who had issued in 1976 certificates of inspection after eight hours of production run for the machinery bought and the next day ran an advertisement repeating the earlier statement and showing the certificates issued by Mr Kemp for two of the machines. So they say it is no use Mr Kemp giving another story now. Sources close to Malhotras also claim that Wilkinson Sword blades have fallen behind in blade manufacturing technology and their sales of razor blades and shaving systems have dropped to below 50 per cent in the last two years. Wilkinson was losing money heavily in its blade manufacturing division and had been salvaged only by amalgamation of its balance-sheet with a match company. Moreover, Wilkinson have now been taken over by the American giant corporation, Alleghany Ludlam to save it from going into liquidation.

Pig iron: Will supplies improve?

THE liberalisation of pig iron imports under the import policy for 1981-82 by placing them under open general licence has obviously not brought relief to the foundries, and the Government early this week canalised imports of this commodity again through the Steel Authority of India Ltd. It appears pig iron in any grade will be imported only through SAIL.

The decision to canalise pig iron imports is said to have been taken in view of heavy premium of Rs 3,000 per tonne the material is currently attracting in open market. The Government expects canalised imports at international prices should provide a measure of stability to the operations of the consumers, especially foundries and spun pipe units, a number of which are reported to have downed the shuttters owing to non-availability of the material. Capacity utilisation in these units, which have somehow managed to remain in the picture, has dropped to a dismal 35 per cent and chances for improving this rate are not bright as pig iron production by indigenous steel plants has been declining. So unless the government agency moves rapidly in the matter of placing orders for imported pig iron, it appears consumers will have to bear with the present difficulties.

At the present world prices, the landed cost of imported pig iron will be higher by about Rs 1,000 per tonne compared to the indigenous price, because 40 per cent import duty and Rs 160 per tonne countervailing duty are involved.

Bumper harvest, higher consumption

THE Food and Agricultural Organisation (FAO) expects a total cereal production this year between 1.48 billion and 1.535 billion tonnes which compares with the 1980 figure of 1.435 billion tonnes. But FAO has cautioned that despite bumper harvest prospects, the world cereal stocks are likely to fall this year to the lowest level since 1975-76. While there could be a rise of 45 million to 100 million tonnes over 1980 figure, the FAO believes that most of the increase is likely to be accounted for by increased consumption and stocks to be carried over in 1982 are forecast to be 27 million tonnes down at 224 million tonnes, equivalent to just 15 per cent of the world consumption.

COMMODITIES

Limited business in cotton

Bombay, September 7

Listless trading conditions prevailed in the spot cotton market during past week with limited business passing. For want of adequate support, prices of a few varieties declined by Rs 50 to Rs 100 per candy over the week.

According to informed sources, arrangements are being made in Karachi to expedite the shipment of Pakistani cotton. The Indian Cotton Mills' Federation is continuing its efforts to impress upon the mills to take up as much Karachi cotton as possible. So far, the efforts have not brought about the desired degree of response.

In the meanwhile, the ICMF has urged the Industrial Development Bank of India (IDBI) to grant more loans to textile mills to enable them to go ahead with their approved modernisation programmes. With the escalation in their prices the book value of newly installed machinery, according to the ICMF, is bound to be higher than the one adopted for creating of security while sanctioning the modernisation loans. The higher book value would provide enough security for any additional loan that needs to be granted by IDBI for taking care of the overrun in the projects, it is argued by the ICMF.

At the time of applying for the IDBI soft loans, the mills had made financial projections on the basis of the then profitable working and the then obtaining machinery prices. They had also provided for promoters' contribtution towards investment in fixed assets and working capital requirements on the basis of then prevailing situation. These calculations had, however, gone awry because of the steep rise in machinery prices and the deteriorating conditions of the mills. It is in these circumstances that the ICMF has asked for a review of the IDBI soft loan scheme.

The IDBI itself is apparently in the hunt for more funds. It is planning to tap deposits from the public in a big way besides resources from abroad. Its attention is increasingly turning to non-traditional sources of finance to bridge a substantial part of the resources gap estimated at over Rs 400 crores for 1981-82.

The demand for textile machinery has declined markedly in the past few months and many manufacturers have been asked to postpone or cancel orders previously placed. The demand decline is to the extent of 65 per cent. In the case of some of the manufacturers. This situation has come about at a time when the machinery manufacturers have been able to supply machinery within 18 to 24 months as against 30 to 36 months earlier.

Reports from Ahmedabad indicate that the National Textile Corporation (Gujarat) is considering a proposal to set up a 100 per cent export-oriented composite textile mill at a total cost of Rs 38.32 crores at Naroda. The unit will have a foreign exchange component of Rs 13.57 crores and will have a capacity to produce 60,000 metres, providing employment for 1,650 workers.

The following is the trend of prices of some of the leading varieties :

(Rs. per candy)

	Septembet 4	August 28

Yarn prices rise

Bombay, September 7

A rise in prices highlighted trading in the local yarn market. 150D NRC, 120D NRC, 150D CR, 120D CR and 100D SIV were quoted higher at Rs 52.31, Rs 54.52, Rs 52.03, Rs 55.07 and Rs 61.67 against Rs 51.76, Rs 54.10, Rs 51.76, Rs 54.10 and Rs 61.12 respectively in the preceding week. The price of 150D acetate, however, was quoted lower at Rs 48.46 against Rs 49.01 in the previous week.

Dull conditions in jute goods

Calcutta, August 31

Trading was a dull affair in jute goods in the Calcutta gunny market during the past week as buyers were generally reluctant to make fresh commitments pending the Government's decision on industry's request for subsidy on exports of jute goods.

Price fluctuations consequently were dictated by speculative activity throughout the week under review. Initially there was a setback in the wake of selling but prices reversed the trend subsequently on optimism that the Centre would grant the industry's request on subsidy.

The fibre market was also dull due to slack buying by jute mills. The inflow of the fibre was however fair this being the peak arrival season.

New Delhi reports reaching here said that for the first time in several years the Union Commerce Ministry has officially admitted of the difficult conditions in world markets for jute goods leading to losses on exports. It is considering proposals for giving cash compensatory support and DGS and D purchases to boost demand.

At the prevailing market prices, mills are losing on an average Rs 2,707 a tonne on carpet backing cloth, Rs 1,430 a tonne on hessian and Rs 857 a tonne on sacking, according to the ministry. It has attributed the difficult situation to the recessionary conditions in developed countries and competition from Bangladesh and synthetic substitutes. Information on the prospects for the sale of carpet backing through overseas offices is being collected and corrective measures are under way.

Meanwhile, the Centre is considering the possibility of a short-term buffer stock in sacking as also compensatory assistance for the export of carpet backing, according to Mr Saran Singh, Textile Secretary in the Union Ministry of Commerce. Mr Singh told a two-day seminar on jute here over the week-end that Indian jute goods could regain their competitive position in the international market by taking specific measurts to reduce costs. The industry, he said, had kept

Indo-Australian trade: Exploring new areas

Concluded from page 477

Referring to the repeated talk on developed countries and third world countries getting together, Mr Gough said Australia had technical advantages and India plenty of labour. This meant there were opportunities for joint ventures. Australia would spend Rs 36 billion on mining ventures in the next few years and would need equipment for that. Indian engineers could get into those ventures. He also believed there would be advantages in an exchange of intellectuals of agricultural universities and found the strides made by agriculture in Punjab and Haryana tremendous.

On the problem of difficulties, Mr Gough said Australia did find Indian trade barriers difficult. It was difficult to invest here and taxation rates were very high. It was sad that there was not greater interchangeability. For instance, he said, it was sad there was a duty on imports of Australian wool. He felt India could have developed a big worsted wool industry and had passed up an enormous international market.

One area in which Australia could help India, a delegation member said, was in materials handling in the mining industry. A large number of mining companies would be ready to offer assistance in this area. Australia could also supply many more minerals to India.

Finally, Mr Gough stressed the importance of Indian businessmen visiting men there. Taiwan, South Korea and Australia personally or finding middle-Japan did that initially, as well.

its cost element shrouded in mystery and defied efforts of the Jute Commissioner's office to carry out a detailed and scientific analysis of the cost structure.

He cited raw jute purchases by the mills as a case in point. There was a nexus between the private trader and the millowner and the price paid to the jute grower was often below the statutory minimum. The books, however, revealed another story. Despite lack of reliable data and co-operation from the industry, the JMDC technical committee has prepared a detailed report on raw jute, power and fuel (coal) and stores and spares used by the industry. In his view there was considerable scope for cost reduction and achieving higher efficiency in the industry and hope that the technologists and scientists participating in the workshop would find some solutions to the many problems faced by the industry.

Groundnut oil gains

Bombay, September 7

After the recent nervous selling due to raids by income-tax officials on the premises of a number of oil traders, groundnut oil prices again started going up on encouraging advices from producing centres in the oilseeds market. The price was lifted by Rs 1.56 to Rs 150.80 per 10 kg. In sympathy with the groundnut oil, groundnut also moved up. Karad bold, Saurashtra bold and Saurashtra quality edged up by Rs 2 each to Rs 620, Rs 625 and Rs 630 per 100 kg respectively.

Imported oils, however, ruled steady in limited activity. Palmoleine closed unchanged at Rs 143.52 and soyabean at Rs 132.08 per 10 kg. RBD, on the other hand, dropped sharply by Rs 5.54 to Rs 115 per 10 kg.

Castorseed receded on poor demand. Madras small and Kanpur bold lost Rs 2 each at Rs 318 and Rs 310 per 100 kg. Castor commercial oil was quiet at Rs 68 per 10 kg against Rs 68.25 in the previous week. Castor BSS oil, however, remained steady at Rs 73.25 per 10 kg.

A drifting trend was in existence in linseed and its oil. The former dropped by Rs 2 to Rs 528 per 100 kg and the latter by Rs 3.16 to Rs 125.84 per 10 kg.

Activity was far from satisfactory in cakes following dullness on the export front. Groundnut expeller dropped by Rs 25 to Rs 1,825 per tonne while de-oil, castor and cottonseed ruled steady.

Comparative prices in rupees per quintal of seeds and per 10 kg of oils :

	5-9-1981	**29-8-1981**
G. nut		
Karad bold	620.00	618.00
G. nut oil	150.80	149.24
Cast. Md. Sm.	318.00	320.00
Cast. oil com.	68.00	68.25
Cast. oil BSS	73.25	73.25
Linseed bold	528.00	530.00
Linseed oil	125.84	129.00

Grains subdued

Bombay, September 7

A subdued trend prevailed in the local foodgrains market during the past week. Barring wheat (Saurashtra) and rice (Basmati) all other grains showed a steady to declining trend.

In cereals the superior variety of wheat declined by Rs 7 to Rs 270-295 per quintal. Demand was slack. Receipts were 2,000 bags per day. The Saurashtra variety hardened by Rs 2 to Rs 208-235 per quintal.

In rice, the Surti Kolam variety ruled steady at Rs 340-400 per quintal. Supplies were comfortable. The Basmati variety firmed up by Rs 25 to Rs 500-700 per quintal on account of paucity of supplies. Export demand was good.

In coarse grains, trading was restricted. Jowar and maize maintained the earlier week's levels of Rs 190-235 per quintal and Rs 185-190 per quintal respectively. Bajra eased by Rs 3 to Rs 190-250 per quintal.

Among pulses gram and massoor dal declined. Gram was traded Rs 9 lower at Rs 380-400 per quintal and masoor dal was traded Rs 33 lower at Rs 460-490 per quintal. Tur dal and urad (Khandesh) ruled steady at Rs 450-575 per quintal and at Rs 310-315 per quin-

are you a small investor

DHRANGADHRA CHEMICAL WORKS LIMITED

NOTICE

It is hereby notified for the information of the public that Dhrangadhra Chemical Works Limited proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval for the establishment of a new undertaking for the production, supply, distribution or control of 1,200 MT per annum of Stainless Steel Sheets. Other particulars of the proposed undertaking are as under :

(i)	Name of the proposed undertaking :	**DHRANGADHRA CHEMICAL WORKS LIMITED**
(ii)	Name(s) of person(s) or authority/authorities proposing to establish the new undertaking. Where it is a body corporate furnish details of its management structure together with those of the proposed undertaking :	Dhrangadhra Chemical Works Limited which is managed by Managing Directors under the supervision and control of the Board of Directors, namely : Shri Sahu Shriyans Prasad Jain (Chairman) Shri Gian Chand Jain (Managing Director) Shri Shashi Chand Jain (Managing Director) Shri H. H. M. Sriraj Dhrangadhra Shri A. K. Roy Shri Gopaldas P. Parikh Shri Dharma Vira Shri Radhakrishna R. Ruia Shri F. H. Tapia Shri K. M. Philip Shri Prem Chand Jain Shri D. G. Ramaiah Dr. G. P. Kane The new undertaking will be managed by the Managing Directors under the supervision and control of the Board of Directors. If necessary, a new Managing Director may be appointed to look after the new undertaking subject to the approval of the Government of India.
(iii)	Capital structure of the applicant person or authority and of the proposed undertaking :	

SHARE CAPITAL :

Authorised Capital :		
1,00,000 Preference Shares of Rs. 100/- each	1,00,00,000	
2,50,000 Equity Shares of Rs. 100/- each	2,50,00,000	3,50,00,000
Issued, Subscribed and Paid up Capital :		
2,591—11% (subject to tax at source) Cumulative Redeemable Preference shares of Rs. 100/- each fully paid up	2,59,100	
25,000—9.5% (subject to tax at source) Cumulative Redeemable Second Preference shares of Rs. 100/- each fully paid up	25,00,000	
35,000—9.5% (subject to tax at source) Cumulative Redeemable Third Preference shares of Rs. 100/- each fully paid up	35,00,000	62,59,100
2,34,774 Equity Shares of Rs. 100/- each fully paid up	2,34,77,400	
Add : Forfeited Shares	200	2,34,77,600
		2,97,36,700
140—7.8% Cumulative Redeemable Preference shares of Rs. 100/- each not surrendered by shareholders for redemption		14,000
		2,97,50,700

(iv)	Proposed location of the new undertaking :	Ponda Taluka, Goa
(v)	Brief outline of the cost of project, the scheme and source of finance :	Estimated cost of the project —Rs. 300 lakhs. The project is intended to be financed partly from our own resources, partly from borrowings and incentives available from State authorities for backward areas.

Any person interested in the matter may make a representation to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

Dated this 31st day of August, 1981.

tal respectively. Moong (chumki) was quoted at Rs 450 per quintal showing no change over the week.

Sugar recedes

Bombay, September 7

Sugar prices declined sharply in the local market due to lack of buying support. The price of sugar C-30 was quoted Rs 40 lower at Rs 524-531 per quintal. The undertone was subdued. Upcountry demand was at a low ebb. The weekend stocks of sugar improved from 906 bags in the previous week to 1,111 bags at the close of the past week. The price of C-30 as on September 5, 1981 was lower by Rs 322 per quintal than on the corresponding date a year ago.

Khandsari inferior variety was quoted at the weekend at Rs 400 per quintal, while the superior variety was placed at Rs 500 per quintal.

The Union Government fixed the tariff value of sugar at Rs 550 per quintal for September 1981.

Gold down, silver erratic

Bombay, September 7

A downtrend in gold and an erratic tendency in silver marked trading in the Bombay bullion market during the past week. Standard mint gold opened at Rs 1,780 per 10 gms and gradually drifted to close at Rs 1,745 per 10 gms. Ready silver (.999 fineness) resumed at Rs 2,715 per kg and firmed up to Rs 2,745 per kg before closing at Rs 2,730 per kg.

Money easy

Bombay, September 7

Conditions in the Bombay short-term money market were comfortable during the past week. In the inter-bank call section interest rates opened at 9.5 per cent and moved between 8.5 per ecnt and 10 per cent. The market closed with interest rate at 10 per cent.

Bank credit contracts

Bombay, September 7

Bank credit of scheduled commercial banks contracted by Rs 31.38 crores to Rs 26,790.81 crores during the week ended August 28, 1981. Aggregate deposits spurted by Rs 204.12 crores to Rs 40,987.96 crores. The balances of banks with the Reserve Bank of India (RBI) declined by Rs 588.91 crores to Rs 4,543.32 crores while their borrowings from the RBI increased by Rs .04 crores to Rs 561.60 crores.

RALLIS INDIA LIMITED

NOTICE

It is hereby notified for the information of the public that RALLIS INDIA LIMITED proposes to make an application to the central Government in the Department of Company Affairs, New Delhi, under sub-section (4) of Section 23 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to the acquisition of the whole or part of PROTEIN PRODUCTS OF INDIA LIMITED. Brief particulars of the proposal are as under:

(i)	Name and address of the applicant undertaking	: RALLIS INDIA LIMITED, 'Ralli House', 21 D. Sukhadvala Marg, Bombay-400 001.
(ii)	Name and address of the undertaking the whole or part of which is proposed to be acquired and the manner of acquisition, i.e., by purchase take-over or otherwise	: PROTEIN PRODUCTS OF INDIA LIMITED, Sandynalla, Sholur Town Panchayat, Ootacamund-643 237. The acquisition is by way of purchase of 5,36,000 equity shares of Rs. 10/- each fully paid, at Rs. 12.50 per share.
(iii)	Management structure of the applicant undertaking	: The Company is a Board-managed Company. The Directors of the Company are :— Mr. D. S. Seth (Chairman), Mr. A. D. Mango (Deputy Chairman), Sir George Burton, Mr. J. S. Kerridge, Mr. A. S. Mathieson, Dr. F. A. Mehta, Mr. V. J. Sheth, Mr. M. R. Shroff, Mr. H. J. Silverston, Mr. R. N. Tata, Mr. J. S. Hewitt (Alternate Director to Sir George Burton).

(iv) Capital structure of:

(a) the applicant undertaking :

Authorised Capital	Rs.
Preference	1,00,00,000
Ordinary	8,00,00,000
Unclassified	1,00,00,000
	10,00,00,000
Issued, Subscribed and Paid-up as at 31st August, 1980:	
75,000 6% Cumulative Preference Shares of Rs. 100/- each fully paid ..	75,00,000
4,96,039 Ordinary Shares of Rs. 100/- each fully paid	4,96,03,900
	5,71,03,900
Add : Forfeited Shares	1,800
	5,71,05,700

(b) the undertaking proposed to be acquired :

Authorised Capital	Rs.
Preference	75,00,000
Equity	2,00,00,000
	2,75,00,000
Issued, Subscribed and Paid-up as on 30th September, 1978:	
3,00,000 9.5% Redeemable Cumulative Preference Shares of Rs. 10/- each fully paid	30,00,000
9,00,000 Equity Shares of Rs. 10/- each fully paid	90,00,000
	1,20,00,000

(v)	Line(s) of business of the undertaking which will or is likely to emerge as a result of the proposed acquisition	: At present, Protein Products of India Limited manufactures and sells gelatine, ossein and dicalcium phosphate, and will continue to do so after the acquisition.
(vi)	Consideration for the acquisition	: Payable in cash.
(vii)	Scheme of finance indicating the sources of finance for the proposed acquisition	: Finance for the proposed acquisition is to be met from the Company's own current resources.

2. Any person interested in the matter may make a representation to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this Notice intimating his views on the proposal and indicating the nature of his interest therein.

Long-term planning in business

By K. CHANDRASEKHAR

"STRATEGIC planning" is a term we hear with increasing frequency. More and more managers in business firms and other organisations are trying to plan, execute and control the operations in a strategic manner. This means that they look for a more precise picture of desired results and a strategy for achieving them. They consider many alternate strategies, not merely how to continue current activities, plans and policies, for achieving the projections.

The post-independence era, with the governmental emphasis on industrialisation of our country and the consequent introduction of developmental plans, brought new resource applications, improved technology, varied groups of customers, and new forms of competition. Shortening product life cycles and the availability of new technologies and concepts caused many organisations to realise that they could not leave their future to chance and that management by intuition or reaction alone was, at best, risky. From this realisation that there was a growing need to guide future events evolved the concept called the planning process. Typical of a "mixed economy that we have adopted, the national government and large business houses have led the way in adopting this process.

Planning is a process by which an individual, organisation or nation decides in advance on some future course of action. The process consists of a series of steps, some of which may be taken immediately, to reach desired goals. Planning can be equally valuable to organisations in achieving their objectives and the individuals in attaining personal aims. At organisational level, it is concerned with taking action in the immediate present to prevent becoming obsolete in the future. To put it in another way, planning is concerned with how an organisation can change internally to adopt to variations in external conditions.

The entrepreneur(s) first of all should have some specific ideas for the direction of the organisation. Finding the best way to get there is what we call strategy development. The key to good strategy development is to foresee and use the external and internal forces or trends in order to move the organisation towards its objectives. There are certain important external factors, like the following ones, which make the planning process essential for organisational survival: (i) Accelerating pace of economic, social and technological changes; (ii) Interdependencies among modern organisations; and (iii) Complexity of social business undertakings.

In most organisations, management has been formalised by defining the duties and authority of members and by linking them in a hierarchial authority structure. Also, formal planning steps are common in which the level of organisation's output or services is forecast or set and budget for operating expenses and capital additions are prepared. Specific performance goals are often set and a control system is instituted to measure actual results and compare them with expected results.

This type of planning is known as operational planning when the nature and scope of activities have been prescribed and when policies which guide actions have been determined. The time horizon is no longer than one or perhaps two years, and management performance is evaluated on the basis of short-term results.

Operational planning is necessary but it alone is not sufficient. An organisation may survive and perform exceptionally well for many years by careful operational planning without even considering a change in its basic strategy. However, the best "strategic structure" or composite set of policies and plans will not achieve desired goals forever. Internal resources change and so too the external environment, including social, economic, political, technological, and physical components. Thus, every organisation needs to review systematically and regularly its objectives and goals, the broad plan or strategy currently used to achieve these goals, the level of accomplishment, the internal resources available for future activities, to expected shifts in external factors over the next few years, and alternative strategies which can be used to achieve goals in the future. This is strategic planning.

Strategic or long-range planning is thus much more concerned with major assessment of the external and internal forces, and with the establishment of long-term objectives and major strategies. In contrast to operational planning, strategic planning is not normally done at regular intervals. The basic steps in the planning process are as follows :—

(1) Determine organisational purpose and management philosophy (2) identify internal strengths and weaknesses (3) Monitor changes in the external environment (4) Forecast future conditions and establish planning premises (5) Determine external threats and opportunities (6) Formulate specific goals (7) Identify and evaluate alternative policies and strategies (8) Select best strategic plans (9) Prepare functional action plans (10) Prepare financial plans.

Life span of many new projects is getting relatively shortened for they become replaced by new, improved technology. Management is defined as planning and using resources such as time, money, energy, manpower etc to achieve stated objectives or goals. Objectives can serve a number of purposes since they state the basic long-term aspirations of the organisation, usually in terms of its values.

Strategy defines the basis for all the further action steps in planning. Developing an appropriate strategy is a creative process that tries to make maximum use of the internal and external macro forces to propel the organisation towards its objectives. Strategy can be thought of as making the best use of the forces over which we have little or no control by using the forces which we do control. Specific strategies would then be developed in production, finance, marketing, research and development, etc. Each strategy attempts to make optimal use of the external or internal forces to help attain the organisation's objectives.

In the mid-1970s, many firms and organisations had started formal long-range planning because of the expansion and resultant complexity in business operations and their need to evaluate many investment opportunities so as to allocate scarce resources most effectively. Strategic planning can provide benefits in any organisation which far exceed the cost if managers are willing to search for new opportunities in a changing, uncertain world rather than bask in the satisfaction of past accomplishm

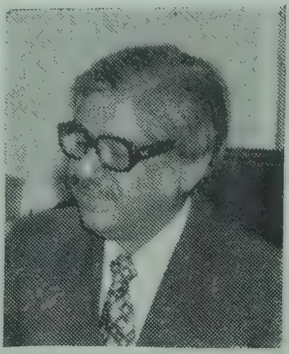
PEOPLE

Mr V. H. Doshi, managing director of Echjay Industries Private Ltd, has been elected president of the Association of Indian Drop Forging and Stamping Industries. Mr B. N. Kalyani, general manager of Bharat Forge Co Ltd, was elected vice-president.



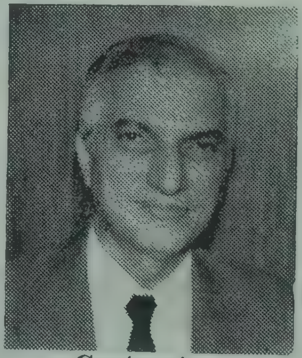
Bali

Mr V. K. Bali has been appointed president of the Tata Oil Mills Co Ltd from September 1, 1981. Till recently he was the vice-president of the company.

Mahajan

Mr N. N. Mahajan, who has taken over as the chief general manager of the Kanpur Circle of State Bank of India, was the chief executive officer of SBI at Los Angeles, USA. Mr Mahajan holds a master's degree in economics and joined the then Imperial Bank of India in 1952 and held many responsible positions with IBI, and its successor, SBI, especially in foreign exchange business and overseas expansion. His services were also loaned to other organisations and he also was a member of many trade delegations.

Mr S. H. Jadhav, director, Small Industries Service Institute, has taken over as the managing director of Bharat Leather Corporation from September 1, 1981.



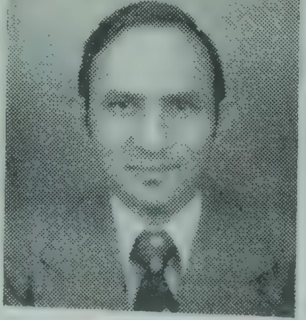
Contractor

Mr Dady K. Contractor has been elevated as general manager of the Central Bank of India with effect from September 9. Mr Contractor joined the bank in 1946 as an officer trainee and held several responsible positions. Till recently he was holding charge of the industrial finance division as its deputy general manager.

Mehta

Mr Labhshanker S. Mehta, who was till recently deputy general manager of Dena Bank, has been promoted as general manager with effect from September 9, 1981. He succeeds Mr Chandrakant R. Trivedi who has been appointed executive director of the bank. Mr Mehta joined the bank in 1943 and is an expert in international banking. He is also actively associated with several social, cultural and religious organisations.

Mr S. S. Roongta has taken over as traffic superintendent and chief public relations officer, Metropolitan Transport Project (Railways), Western Railway, at Churchgate, Bombay.



Shah

Mr N. P. Shah has been promoted as the assistant general manager (international division) at Bank of Baroda. He will be looking after project finance and correspondent relations in the bank. Prior to his promotion Mr Shah was looking after the Bombay city branches as regional manager.

THE WEEK

Industrial Development Bank of India will issue on Tuesday next its 23rd series of bonds to raise Rs 100 crores. The bonds, which will carry interest at 7.25 per cent per annum, will have a maturity period of 15 years.

★

The East India Cotton Association Ltd has received the concurrence of the Forwards Markets Commission to begin trading with effect from September 4 last in non-transferable specific delivery contracts in CJ-73, SRT-1, Shankar-4 and Varalaxmi varieties of cotton of 1981-82 season grown in Gujarat. However, delivery against the contract will be in the month not later than the third month following the month in which the contract was entered into.

★

Under an amendment to the Income-Tax rules passed by the Lok Sabha on Monday, companies can repay deposits in excess of Rs 10,000 by only account payee cheques or drafts.

★

The Salem steel plant went on stream on Sunday and has commenced production of cold-rolled stainless steel coils and sheets. This is the first public sector steel plant to be commissioned during this decade.

★

Kudremukh Iron Ore Co Ltd, a public sector undertaking, has signed two separate contracts with Rumania for setting up a pelletisation plant and for supply of three million tonnes of iron ore concentrates.

★

The Andhra Pradesh Government has decided to take over wholesale distribution of rice and wheat in the State within one year. For this purpose, Essential Commodities Corporation Ltd has been set up, Civil Supplies Minister, Mr G. Venkata Swamy, has announced.

★

Steel Authority of India Ltd has decided to give a rebate of Rs 50 per tonne on bars, rods and billets to housebuilders. It will also set up a design bureau at Visaknapatnam.

★

Wholesale price index

At 286.2 the latest available wholesale price index for the week ended August 29, 1981, showed a fall of 1 per cent over the preceding week. However, at this level the index was higher by 10 per cent than its level a year ago.

Money stringent

The Bombay short-term money market witnessed stringent conditions on Monday (September 14, 1981). Both notified and commercial funds were renewed at ten per cent. Fresh money was also transacted at ten per cent.

COMMERCE

Plight of the poor world

THE International Monetary Fund (IMF) in its 1981 annual report describes the world economic situation as 'difficult and disappointing'. The world economy is characterised by high rates of inflation in many countries; recession in industrial output, deceleration of growth, higher unemployment and record levels of interest rates in the industrial countries; instability of exchange rates, slowdown in trade expansion, falling terms of trade, large current account deficits and crippling debt burden of non-oil developing countries. The high levels of interest rates have constituted a drain on the international purchasing power of most net debtor countries. "This problem is especially serious for the non-oil developing countries at a time when their international purchasing power is already under pressure..." the IMF comments.

During 1980 the growth of real GNP of the industrial countries turned out to be a meagre 1.2 per cent as compared with about four per cent per annum during 1976-79. Real GNP recorded a decline, *albeit* nominal, of 0.2 per cent in the United States and of 1.7 per cent in the United Kingdom in 1980. Consumer prices in industrial countries increased at an accelerated rate of 12 per cent in 1980 as compared with 7 per cent in 1978. The plight of the non-oil exporting countries which numbered 110 was worse. At 4.8 per cent the average rate of growth of their real GDP in 1980 was lower than that in the preceding three years : 5.2 per cent in 1979, 6.5 per cent in 1978 and 5.3 per cent in 1977 (in this respect India fared better with a growth rate of about 7½ per cent in real national income in 1980-81). The decline in the rate of their GDP emanated partly from the recessionary conditions prevailing in the industrial world. While the terms of trade of the oil exporting countries improved by 42 per cent in 1980, those for industrial countries deteriorated by 6.7 per cent and non-oil developing countries by 3.1 per cent.

The recession of the industrial world in turn adversely affected the growth of exports of the non-oil developing countries. Faced with the resources constraint, the level of development expenditure in these countries could not achieve the desired levels and resulted in reduced demand for domestic output. This whole process of retarding their growth was aided by the restrained monetary and fiscal policies. However, these policies could not control the inflationary forces. As a result, continued rise in the prices dimmed the growth prospects in that consumer prices during 1980 in the non-oil developing countries spurted by as much as 32 per cent as against 24 per cent in the previous year and 19 per cent in 1978.

It was against this background that the current account deficit of the non-oil developing countries had been steadily mounting during recent years and almost trebled from $ 29.000 million in 1977 to $ 82,000 million in 1980 and was likely to reach a new high of $ 97,000 million in the current year. As percentage of GDP this deficit steadily increased from 3 per cent in 1977 to 4.8 per cent in 1980. If the oil importing countries find themselves in a precarious position, oil exporting countries are flush with funds. Their current account surplus in 1980 amounted to $ 1,12,000 million and was likely to be of the order of $ 96,000 million in 1981. To finance a large current account deficit, non-oil developing countries were forced to resort to heavy external borrowings. Such debts increased by $ 47,000 million to $ 3,70,000 million during 1980.

India has also fallen a victim to the staggering rise in the international prices of petroleum and products. Its oil import bill of Rs 5,200 crores in 1980-81 accounted for nearly 80 per cent of its total export earnings leading to a staggering trade deficit of Rs 5,535 crores. Until recently, largely on account of the tremendous growth of income from invisibles (including inward remittances from Indians abroad), India enjoyed a comfortable balance of payments position. But there has been a change in that situation. Following deceleration in the inflow of income from invisibles and the continuing trade deficit, India has been facing payments difficulties. During the first five months (April-August) of 1981-82, the country's foreign exchange reserves have fallen by Rs 1,069 crores or at the rate of more than Rs 200 crores a month. The foreign exchange reserves of Rs 4,247 crores at the end of August were not enough to meet six months' imports (without the IMF loan of Rs 815 crores taken earlier reserves would have been just Rs 3,432 crores). It is in this context that India has approached the IMF for a loan of about $ 5,600 million. This is one instance how an oil importing country, even when it is somewhat better placed than some other oil-importing countries, finds it difficult to meet the external obligations in the present international economic situation.

The IMF's report observes that the positive relationship between the rate of overall economic growth and that of oil consumption in industrial countries seems to have weakened during recent years. While their real GNP increased by 1.2 per cent in 1980, energy consumption declined by 3 per cent. On trends in the more severely affected non-oil developing countries, unfortunately, the IMF has no comments to offer. It is rather mystifying that while commenting on the factors adversely affecting the output of non-oil developing countries, recession in the industrial countries is adequately played up as one of the factors contributing to the lower growth of the exports of non-oil developing countries, but there is not even a word about the rising protectionist policies of the industrial countries. If recession in the developed countries affected adversely the increase in real GDP in the non-oil developing countries, the protectionist policies of the former did even more.

India-Bangladesh parley

THE easing of tension in the relationship between India and Bangladesh over the New Moore Island which Bangladesh calls South Tallpatti is to be welcomed unreservedly. In the relations between the neighbours there are bound to be differing claims on contiguous territories and territorial waters. The interest of neither is served by keeping alive tension and conflict. Nor is it profitable to go into reasons that might have prompted one country or the other to come down from its belligerent pose. It has been suggested in some quarters that the Government of Bangladesh chose to discuss the matter with India after the decision had been taken to postpone the presidential election in deference to the wishes of the opposition parties and that this postponement had removed the necessity to continue the hate-India campaign, to boost which the controversy over the island proved handy. It may be so or may not be so. But that does not take away from the statesman-like visit of the Bangladesh Foreign Minister, Muhammed Shamsul Huq to this country to discuss an amicable settlement of the dispute.

It was well that there was no fixed agenda for discussion with the Bangladesh Foreign Minister. When disputes over small matters assume big proportions they signify a certain loss of mutual trust and confidence. Only through the restoration of the mutual trust the climate is made conducive for the settlement of specific disputes. Thus the entire gamut of the strained Indo-Bangladesh bilateral relations were covered during the discussions that Mr Huq had with the leaders of the Indian Government. The outcome of the talks was the decision of the two countries that the settlement of contentious issues like New Moore Island and Farrakka Barrage and the maritime boundary should be sought in a constructive and positive manner. The Indian Prime Minister, Mrs Indira Gandhi, made it clear to the visiting Bangladesh Foreign Minister that India wished to have close and friendly relations with Bangladesh and emphasised that the two countries should cooperate with each other to further the cause of peace and stability in the region, taking into account the long-term interest of the people of the two countries.

In the light of the conclusions arrived at the discussions held by the Foreign Ministers of Bangladesh and India, the foreign secretaries of the two countries would meet next month to re-examine all the available data and pave the way for an early peaceful solution to the New Moore — South Tallpatti Island that was causing tension. The foreign secretaries would also explore means of resolving all outstanding problems related to the land boundary including finalisation of the terms and conditions of lease-in-perpetuity of the Tin Bigha corridor. The foreign ministers of the two countries would also meet at an early date to resolve the Farrakka Barrage. The two foreign ministers agreed to intensify efforts to find a solution to the long-term problem of augmenting dry season flows of the Ganga in the context of the difference between the two countries over the Farrakka Barrage.

A disappointing aspect of the Indo-Bangladesh relationship is the slow growth in trade between the two countries where the potentialities are far from being fully realised. India is among the first five trading partners of Bangladesh. But then the total of Indian exports to Bangladesh amounted to only Rs 65 crores (India's total export trade amounted to Rs 6,814 crores during 1980-81) and imports from Bangladesh at Rs 10 crores (India's imports totalled Rs 8,908 crores) were even less. Indian exports to Bangladesh were higher during 1979-80 when these totalled over Rs 100 crores; but imports from Bangladesh during 1979-80 totalled just a little over Rs 5 crores. Indications are there that both the countries have come to see the gains they can make from an extension of the business connections with each other. There is reduced hostility to things Indian in Bangladesh since the flow of spurious and substandard goods through unscrupulous operators have ceased.

There is a welcome willingness among Bangladesh industrialists and businessmen to consider Indian technology, which has relevance for another underdeveloped country like Bangladesh, on merits rather than with a prejudiced eye, as they were wont to do until recently. For the Bangladesh conditions Indian products often are found to provide better service and reliability than products made by manufacturers in the more advanced industrialised countries. Some Indian products are even price competitive *vis-a-vis* those from other countries. A well-known Indian scooter manufacturing company assembles 3,000 scooter rickshaws in Chittagong. HMT has been given a licence to manufacture tube lights. Bangladesh is now the eighth largest importer of engineering goods from India. The newsprint and wet blue leather from Bangladesh are becoming quite popular in India. If the artificial trade barriers are removed both the countries would benefit from savouring a wider range of each other's products.

New oil finds

THE announcement by Mr P. C. Sethi about new oil finds, both onshore and offshore, is encouraging news at a time when the oil import bill continues to be crushing. The Petroleum Minister has reported the discovery of 80 sq km new oilfield, 35 km east of Bombay High, and three days later went on to announce oil finds in Tripura and Nagaland and discovery of oil in new wells in proven fields in Assam and Gujarat. The new offshore field is an indicator that further exploration of offshore areas could prove rewarding. Geologists have even otherwise calculated that of the geological oil reserves from the various sedimentary basins in India, 67 per cent are in the offshore and that of the total recoverable reserves onshore are about 40 per cent while offshore are estimated at 60 per cent. It should be possible for the Oil and

Natural Gas Commission to exploit the new finds off Bombay High without any difficulty. The well has shown an initial production of 1,030 barrels a day without acidisation and is therefore promising though the extent of reserves in the area will be known only after some more wells are spudded. The Government has already announced a programme to increase the offshore oil production to as much as 21 million tonnes by 1984-85. This, of course, does not take into account the new oilfield discovered off Bombay High or any new discovery that the Oil and Natural Gas Commission may make in the Godavari or other basins. The ONGC's activities in undertaking deep-sea exploration are hampered by the fact that it does not possess the sophisticated offshore rigs and specialised skills. But that should be treated by the ONGC more as a challenge to it than as a barrier to further progress.

Mr Sethi's announcement about the 'small finds' in the north-east region and Gujarat has raised hopes about the eastern region making a better contribution to India's total crude production than it does so far. The region contributed only 2.2 million tonnes to a total of 14.3 million tonnes produced by the dountry in the past year from onshore and offshore sources. Over the Sixth Plan period as a whole the total contribution from the region has been placed at only 10.8 million tonnes while between 1981-82 and 1984-85 the country's total output is placed at 58.14 million tonnes from offshore alone. To these is to be added 24.1 million tonnes from the onshore wells making a total of 82.24 million tonnes.

As for production plans, the Oil Ministry expects more than three million tonnes annually during the last two years of the Plan. If the Tripura and Nagaland finds turn out to be substantial, then the eastern region could supply more than three million tonnes to the national total per year and it will be interesting to know by how much more production can be raised in the next two to three years. Exploration work is also about to be taken up in the northern bank of Brahmaputra and the Sundarbans in West Bengal and, according to some oil experts working in the region, the Sundarbans could well throw up many pleasant surprises if systematic exploration work is done over a reasonable period of time. The Government has completed the takeover of Oil India and its properties in Assam and with this the nationalisation of the oil industry is complete. One direct result of the takeover will be the expansion of refining capacity in the eastern region. The Digboi refinery will be both modernised and expanded. A team of experts from Engineers India is already in Assam to make a detailed feasibility study of the expansion plan.

Limits to urban banks!

THE Reserve Bank of India is facing an embarrassing task in prohibiting new urban co-operating banks or new branches of existing urban co-operative banks in metropolitan centres with a population of ten lakhs and above and allowing them strictly on merits in urban and semi-urban centres with a population of less than ten lakhs. This is apparent from the apologetic and sometimes contradictory wording of the RBI circular and the press note. First, this is a temporary and somewhat *ad hoc* decision, since RBI has said that such a decision has been taken pending "the announcement of new licensing policy for commercial bank branches during the remaining years of the Sixth Plan." Obviously, the RBI has kept an exit valve open, in case too much political or co-operative opposition is generated against its decision. Secondly, the RBI has emphasised two aspects regarding its policies for urban co-operative banks. First is that before promoters of such new banks can expect to get a licence, they should fulfil formalities regarding share capital, number of members and the bye-laws. These are simple rules of mathematical ratios and are easy to understand and operate. As such most people must have believed that they can first get a licence to start a bank or open a branch by fulfilling these requirements. The RBI has warned them it is not enough to fulfil these rules and requirements to get a licence. In addition, promoters should satisfy the RBI on the second requirement that they also comply with the policy governing grant of licences.

There are three elements in such a policy. First the applicant bank should have a truly co-operative character with cohesion and commonality among the members or in the area of operations of the bank. Second, the bank must be urban and should not probe rural areas for additional business. Thirdly, the main purpose should not be to poach business from nationalised banks or gain control over the savings of the community. The first two requirements of this policy are not difficult to understand or fulfil. Urban co-operative banks should be urban and co-operative, no doubt about it. But the third requirement is difficult to comply, or even to understand. Any group of people who have cohesion or commonality are bound to belong to one social, economic, business, cultural or geographical function or area. If there is such a bond of common feelings or functions, they are bound to have control over their savings and some business is bound to be diverted from other commercial or nationalised banks.

The RBI has emphasised that just because an urban bank has the co-operative form, it will not get a preference over the commercial. This is very wise and sound. The real requirement is that the applicant bank should have skills, expertise and experience. This is also very wise and sound. In fact nobody would expect a licence for a bank if it does not have skills, expertise and experience. How is it that RBI has taken special pains to emphasise the obvious? The whole context and the apologetic tone of the RBI circular suggests that the real reason is that the RBI and government fear that urban co-operative banks are competing with the nationalised banks on the basis of their better efficiency and good customer service—and this is what hurts the nationalised banks. It is to protect these commercial banks and their inefficiencies that the RBI is going out of its way to curb the growth of urban banks.

LETTER FROM HONGKONG

A SPECIAL CORRESPONDENT

China: Changing banking scene

FOR nearly three decades after the founding of the People's Republic in 1949, China's banking system mainly played the role of a glorified bookkeeper and cashier for the country's Ministry of Finance, which under the State Council — Cabinet — defined the financial policies and laid down strict guidelines for their implementation. Such a system suited the interests of a highly centralised economy, where external trade remained marginal and foreign investment next to nothing.

But in recent years as China's economic policies have undergone a sea change, its banking system has also seen major structural transformation. In the domestic sphere as rational considerations began to dominate economic activity, the role of planners, financial bureaucrats and bankers started overshadowing those of ideologues. Instead of merely following orders and implementing instructions, they were put in charge of shaping policies to meet the requirements of the new economic directions.

On the international scene China's external trade doubled in the three years to 1980 and technological and economic co-operation with non-communist nations burgeoned, at the forefront of this activity being western bankers, industrialists and traders. Peking also became very active in the international agencies, with the highlight of 1980 coming when it finally joined the International Monetary Fund and the World Bank, having replaced the Kuomintang regime on Taiwan as the government representing the people of China.

After much revamping and reordering the lines of co-ordination, the principal financial institutions of China since 1979 are: People's Bank of China, Ministry of Finance, Agricultural Bank of China, General Administration of Exchange Control (GAEC), Bank of China and People's Construction Bank of China.

The Ministry of Finance, whose head is a member of the State Council and China's governor to the World Bank, is in charge of fiscal management and the central budget, both annual and long-term. It supervises the provincial budgets and is responsible for drawing up the national capital construction budget.

People's Bank of China ranks along with the Ministry of Finance as a member of the State Council. Its president is China's member of the IMF. It handles all domestic banking, except agricultural finance and new capital investments. It offers short-term loans to industry and commerce for working capital and replacement capital. With a staff of about 330,000 and a branch network reaching remote rural areas, its presence rivals that of any other government agency. It has a supervisory role over Bank of China, Agricultural Bank of China and GAEC.

Agricultural Bank of China, with its 23,000 branches, most of them in rural communes, extends farm credit, supervises rural credit co-operatives and accepts peasants' savings deposits.

People's Construction Bank of China, which was reestablished in 1979, comes directly under the State Capital Construction Commission which approves the projects and the Ministry of Finance, which provides the funds. Even if a project is cleared and funds are available, the bank can exercise considerable clout in examining the final feasibility of a project.

GAEC, works in conjunction with the Bank of China and is directly answerable to the State Council. It plans exchange control policies and implements those. It also sets foreign exchange rates of the Chinese *renminbi*, after due clearance from the People's Bank.

In 1980 there have been extensive discussions to establish an industrial-cum-commercial bank, to take over some of the functions of the People's Bank. The plan was to let the People's Bank concentrate only on its role as a central bank and the resultant monetary functions. Under the proposals the new bank would have specialised in providing working capital to industrial and commercial enterprises and term loans for replacement or renovation of capital plant and equipment. Although the proposals which called for the new bank to be set up b 1982, had a large measure of support the leadership has decided to shelve th issue as the pace of economic change an the bank lending, particularly for capita projects, has been so fast that a ne bank would compound the problems fur ther.

Along with banking, China's ne leaders have also paid attention in em phasising the insurance sector. For ove two decades the People's Insurance Cor poration of China (PICC) had been en gaged solely in marine cargo and expor insurance. But in 1980 it revived its do mestic market and with growing expor trade began seriously expanding the external insurance market also.

PICC's international business pre mium income in 1980 rose to 230 million yuan from 170 million the previous year, whereas income from reinsurance in 198 rose to US $150 million from US $120 million in 1979. In the domestic market the company's premium income in 1980 was 200 million yuan on the insured worth of assets totalling some 100 billion yuan.

Profit for 1980, including investments and interest in addition to operating profit was about 60 million yuan compared with PICC's profits for 1979 of 44 million yuan. Total assets of the insurance firm were put at 1 billion yuan at the end of 1980 as against 705 million yuan a year before.

Overseas, the PICC joined an international syndicate headed by Continental International in 1980 to deal in the New York market. Its sister left-wing firm Ming An Insurance of Hongkong has a similar tie up with American International Group of New York. PICC also has a stake in the UN sponsored Asia Reinsurance Corporation of Bangkok, which is supposed to serve the Third World members of ESCAP.

Considerable portion of PICC's profits are known to be invested in Hongkong's real estate sector.

Bank of China (BOC) which had been in the news in 1979 and 1980 as

IMF REPORT 1981—WORLD ECONOMY

Mounting debt burden of non-oil developing countries

Following are excerpts from the 1981 *Annual Report of the International Monetary Fund.*

THE world economic situation during 1980 and the first half of 1981 was difficult and disappointing in important respects. Nevertheless, signs of progress in dealing with some of the severe economic problems of recent years have begun to emerge.

For the past two years, dominant characteristics of the world economic picture have included the continuation of inflation at very high rates in many countries; the marked slowing of growth in the industrial countries, resulting in high unemployment and a slowdown in world trade expansion; and external imbalances on current account that have been both extremely large—reflecting major changes in terms of trade — and unusually volatile for some individual countries. Sharply increased deficits on current account have generated financing problems for many countries. Although international flows of credit through private market channels have been remarkably well sustained, a number of the non-oil developing countries, particularly among those with low per capita incomes and limited access to capital markets, have not obtained enough financing to sustain the growth of imports needed to achieve satisfactory domestic development.

A particular source of uncertainty and international concern during 1980 and the first half of 1981 was the prevalence of very high rates of interest, in real as well as nominal terms. These interest rates resulted from the interaction of firmer monetary restraint in a number of the industrial countries with the momentum of the ongoing inflation after a long period of generally inadequate fiscal restraint. Although there are sound theoretical and practical reasons to anticipate a substantial decline in nominal interest rates when inflationary expectations subside, the absence of a reliable basis for gauging the timing of any such change in expectations has tended to maintain uncertainty about the prospects for interest rates.

Meanwhile, the present levels of real interest rates are creating a drain on the international purchasing power of most net debtor countries. This problem is especially serious for the non-oil developing countries at a time when their international purchasing power is already under pressure because of deterioration in their terms of trade, weak markets for their exports, and relatively slow growth in flows of concessional assistance to low-income countries. Any decline in nominal interest rates in major financial centres will be rather quickly reflected in the nominal value of external interest payments by developing countries relying heavily on market finance (because of the prevalence of flexible interest rates—linked to London market rates—on a considerable proportion of their outstanding debt). However, any such decline might be short-lived if inflation and inflationary expectations are not curbed. In view of the imperative need for the industrial countries to control inflation, there seems to be a strong prospect that real interest rates will remain well above the abnormally low or negative levels of the 1970s. The likelihood that external borrowing will remain more costly in real terms than it has been for many years underscores the need for prudent adjustment measures in many of the borrowing countries.

Among the encouraging aspects of the world economic situation at mid-1981 were indications that the inflationary surge of 1979 and 1980 has abated. An opportunity is now presented for its reversal. Monetary expansion in the major industrial countries has been considerably restrained, and might be brought under lasting control if policies of restraint are not relaxed prematurely and are accompanied by appropriate fiscal policies. Although the desired results of firmer monetary control can appear only with an uncertain lag, substantial progress has been made toward establishment of a monetary environment conducive to more stable prices.

One of the obstacles to achievement of a less inflationary monetary environment is clearly the prevalence in many countries of government expenditures at levels beyond those which the public is willing to cover through payment of taxes. The resultant fiscal deficits have made governments strong competitors in credit markets, and have thus contributed to the upward pressure on interest rates. Here, too, however, a considerable shift in direction seems to be in process. Most governments in the larger countries are engaged in strenuous efforts to tighten their fiscal policies, and some of them are working to limit or reduce the role of government in the economy. These efforts do not appear to have been made in vain. With allowance for the more or less automatic effects of the current international recession on both revenues and expenditures, fiscal positions have been appreciably less expansionary in this recession than they were in the 1974-75 recession.

An indication that the more restrained financial policies of the past two years have not been ineffectual is the flattening or deceleration of price increases in a number of countries since the first half of 1980. This development, which has recently been offset in a number of countries by the impact of currency depreciation on import prices, is in part a reflection of the relative stabilisation of oil prices after two years of large increases. However, the incipient tapering of inflation rates also reflects a considerable degree of success, in most of the industrial countries, in containing secondary repercussions of the 1978-80 upsurge in energy costs. In this respect, adjustment to the latest round of oil price increases has been much better managed than was the adjustment of the mid-1970s. In particular, the rise in wages has been distinctly more moderate in relation to current increases in consumer prices during the period 1978-81 than it was following the oil price increases of 1973-74.

A related development of hopeful significance is that the former close linkage between economic growth and oil consumption appears to have been severed during the past few years. After a decline of 3 per cent from 1979 total energy consumption in the industrial countries during 1980 was approximately the same as in 1973 despite a 19 per cent growth of real gross national product (GNP) over the period. In addition, more rapid substitution of non-oil sources for oil has emerged in recent years. Consumption of non-oil energy in the industrial countries is estimated to have risen by 7 per cent from 1978 to 1980, compared with an 8 per cent decline in the consumption of oil. These developments both reflect and support the policy that has now been adopted in most industrial countries of allowing a full pass-through of oil price increases so as to encourage conservation of energy and substitution of alternative energy sources for oil.

Another reassuring aspect of developments over the past two years is the smooth fashion in which the recycling of the large cash surpluses accumulated by the oil exporting countries has been carried out, mainly through private market channels. Many borrowing countries, despite the rise in real costs of credit, have gained valuable time for adaptation and adjustment through the continuation on a large scale of international lending by private financial institutions. Private facilities have been supplemented by expanded activities of international agencies, including the Fund; and the Fund, in particular, now has in place and in prospect arrangements that permit further enlargement of its role. Member countries making sufficiently strong efforts to adjust their external payments imbalances may be permitted to draw on Fund credit up to 450 per cent of their newly increased quotas over a three-year period (subject to a cumulative ceiling of 600 per cent of quota), not counting any drawings under the low-conditionality facilities for compensatory and buffer stock financing.

At the end of June 1981, upper credit tranche and extended arrangements were in effect with 39 members, about four times as many as (on average) during the five years preceding 1979, and they involved large sums. During 1980, new loan commitments and other use of Fund resources reached a total of SDR 9.5 billion, some two to three times the level of previous years; and the corresponding total for the first half of 1981 alone was even larger — nearly SDR 10 billion. The programmes underlying these figures offer solid grounds for hope that orderly adjustment toward viable external positions for the longer run will be widely carried out.

Non-oil developing countries

A wide variety of domestic developments was evident in 1980 and the first half of 1981 among the non-oil developing countries. In the discussion that follows, an effort is made to depict some of the salient distinctions within this group of some 110 countries by focusing attention on selected analytical and regional subgroups.

For the group as a whole, 1980 was a year of high inflation and reduced growth in output. The average increase in real GDP was a little less than 5 per cent, compared with 5¼ per cent in 1979 and 6½ per cent in 1978. All these figures are increased appreciably by the inclusion of data for the People's Republic of China, which was not covered in previous Annual Reports and for which data are available only from 1977 to date. Apart from that country, the average 1980 growth rate was about 4½ per cent, considerably below the average of close to 6 per cent for non-recession years of the late 1960s and 1970s.

At least in part, this shortfall was a reflection of the impact of the current recession in the industrial countries, which has markedly affected the predominant markets for exports of the non-oil developing countries. The recession has tended not only to inhibit the expansion of export volume but also to exert a progressively stronger downward influence on primary commodity prices. The index of such prices (expressed in US dollars) rose substantially less rapidly in 1980 than in the previous year; and it declined in most months from October 1980 through June 1981. The combination of slower growth of export volume and falling terms of trade cut into the purchasing power of export earnings, and a rising share of those earnings was diverted into interest payments on external debt.

For many developing countries, the inflow of real resources obtainable from abroad was thus limited, despite a sharp expansion in the net flow of funds acquired through foreign borrowing. Confronted with a squeeze on the total availability of resources for consumption and investment, some of the affected countries were unable to avoid constraints on the pace of their developmental spending, and these constraints reinforced the negative impact of the international recession on total demand for their domestic output.

During the latter part of 1980 and the first half of 1981, another factor tending to retard the expansion of output in many developing countries was the emergence of more restrained fiscal and monetary policies. Such policies were adopted to combat inflation, or to curb import demands and external deficits on current account, or both. To some extent, the slowing of growth now in process thus reflects implementation of adjustment measures made necessary by the prevalence of internal and external imbalances. However, the shifts away from accommodative financial policies came generally too late to prevent a worsening of inflation for 1980 as a whole. That year's monetary expansion in the non-oil developing countries was larger by about one fifth, on average, than the corresponding expansion in 1979.

Growth of domestic credit, to which the progressive increases of recent years in the average size of central government fiscal deficits have contributed, was the primary force behind the 1980 acceleration in rates of monetary expansion and price inflation. These developments reflected the efforts of many non-oil developing countries to maintain adequate growth in the face of soaring import costs and softening of export markets. Such efforts, however, often came into conflict with other objectives. The tightening of financial policies that began in many countries during the latter part of 1980 appears, as already mentioned, to represent a shift toward renewed emphasis on containment of inflation and of external imbalances.

Slack demand in the industrial world was also a factor in the relatively weak rates of growth in real GDP recorded in 1980 for both the middle-income exporters of primary products and most of the low-income countries (whose exports, in most cases, also consist mainly of primary products). This weakness was especially marked for the numerous small countries in the low-income group. Although the growth rate for that subgroup as a whole was bolstered in 1980 by comparatively sizable gains in the two largest low-income countries (the People's Republic of China and India), real GDP expansion in the other 38 low-income countries is estimated to have amounted to only 3 per cent in 1980. For them, it was the second consecutive year of growth at that disappointingly low rate, barely sufficient to prevent complete stagnation of per capita income. Even with higher increases for China and India included, the average per capita increase in real income in the low-income countries — which contain some two thirds of the population of the entire developing world — was not much above 2 per cent in 1980.

The economic record of the non-oil developing countries in 1980 was marred by another sharp rise in the rate of inflation, which had already turned upward in 1979. As measured by a weighted average of consumer price increases, the inflation rate for the whole group reached 32 per cent in 1980, compared with 24 per cent for the previous year and 19 per cent in 1978. This disturbing flare-up of inflation reflected both the sharp rise in costs of imported goods and the pursuit of expansionary financial policies by a majority of the non-oil developing countries during 1979 and part of 1980. However, as already noted, a shift away from strongly expansionary policies has become evident in many countries over the past year. If the numerous adjustment programmes that have been instituted with a view to improving both internal demand/supply relationships and external balances are appropriately implemented, some easing of the average rate of inflation among non-oil developing countries in 1981 would seem likely.

International trade and payments

International trade and payments developments of the past two years featured unusually pronounced changes in the terms of trade of major groups of countries, large swings in their current account balances, with accompanying shifts in capital movements, and substantial changes in exchange rates, including wide short-term variations in response to changes in monetary conditions and interest rates in the major industrial countries. These changes occurred against a background of continuing high — and quite uneven — rates of inflation and, during 1980 and the first half of 1981, very slow growth of world trade.

The relative importance of sources of change in the terms of trade in the past two years can be inferred from the following : the terms of trade of the oil exporting countries rose by 28 per cent in 1979 and another 42 per cent in 1980 those of the industrial countries fell by 3 per cent in 1979 and 6½ per cent in 1980; and the terms of trade of the oil importing developing countries were reduced by about 8½ per cent over the two years. (Because the non-oil terms of trade of this last group displayed moderate cyclical strength in 1979, but were cyclically weak during the last two or three quarters of 1980, the group's overall terms of trade deterioration over both years was concentrated in the second).

Mainly in reflection of changes in terms of trade, but under the influence also of the cyclical slowdown in world trade stemming from the recession in the industrial countries, swings in the current account balances of major groups of countries in 1979 and 1980 were by far the largest since the middle 1970s. From 1978 to 1980, the increase in the current account surplus of the oil exporting countries amounted to nearly $ 110 billion, while the current account balance of the industrial countries shifted by $ 75 billion in the opposite direction — from a surplus of $ 31 billion (excluding official transfers) in 1978 to a deficit of $ 44 billion in 1980 — and the aggregate current account deficit of the non-oil developing countries more than doubled, to $ 82 billion.

The aggregate current account deficit of the non-oil developing countries was pushed upward dramatically in 1979 and 1980. By the latter year, it had reached $ 82 billion, compared with $ 38 billion in 1978; and a further increase to $ 97 billion is projected for 1981.

For the main group of oil importing countries, the impact of declining terms of trade and reduced export volume growth on the real import purchasing power of export earnings has been severe — indeed, for the low-income countries, almost devastating. Even for the whole group of net oil importers, including the relatively prosperous exporters of manufactures, the rise in purchasing power of exports* dropped to 1 per cent in 1980, compared with 5 per cent during each of the previous two years and well over 10 per cent in the period of buoyant primary commodity prices (1976-77). And for the low-income countries, the purchasing power of export earnings actually declined by about 6 per cent in 1980, after having already undergone a cumulative decline of almost equal magnitude during the preceding two years. The only group of non-oil developing countries with buoyant export earnings expressed in terms of external purchasing power was the subgroup comprising net exporters of oil.

The foregoing considerations explain to a considerable extent both the marked reduction of real import growth for the entire group of non-oil developing countries in 1980 and the sharp contrasts among the main subgroups of such countries with respect to import trends. Even though many countries borrowed heavily of the long-term and medium-term components of such debt (including rough estimates of private debt without a guarantee from the authorities of the borrowing country — a component not covered in previous annual reports) indicate a total of $ 370 billion at the end of 1980, nearly $ 100 billion above the amount outstanding at the end of 1978 and more than 3½ times the end-1973 total. These nominal comparisons, however, do not give a meaningful view of the scale of changes in debt over a period of high inflation and substantial real growth. A more realistic notion of the changes in the scale of the debt can be obtained by comparing it with other basic economic variables that also reflect inflation and growth.

All three major country groups experienced increases in their holdings of total reserves excluding gold in 1980. For the industrial countries, holdings of non-gold reserves grew at approximately the same rate (20 per cent) as the average for all countries. The major oil exporters increased their holdings by 32 per cent, while those of the non-oil developing countries increased much more slowly, by 4 per cent. For the latter group of countries, this was a much slower rate than in 1979 (11 per cent) or 1978 (21 per cent). The sharp reduction in the growth of the reserves of non-oil developing countries as a group accompanied the weakening of their external payments positions resulting from such causes as cyclical factors affecting export receipts higher import costs, and increased debt service. The development of non-gold reserves was even more unfavourable for some subgroups of developing countries those of the low-income countries declined by 5 per cent and those of the group of major exporters of manufactures fell by 10 per cent in the course of 1980.

---

*That is, the value of export earnings deflated by an appropriate index of import prices.

The role of Fund liquidity in the international monetary system

Provision of liquidity, unconditional and conditional, is one of the principal functions of the Fund. Unconditional liquidity is supplied through the allocation of SDRs and, as a by-product of the extension of Fund credit, through the growth of reserve positions in the Fund. Conditional liquidity is made available through the Fund's various lending programmes and facilities. In allocating SDRs, the Fund directly provides reserve assets under rules set out in the Articles of Agreement; this topic is related to the discussion of the preceding section and will, therefore, be taken up first.

Unconditional liquidity

The characteristics of the SDR have been considerably improved during the last year. Since January 1, 1981, the SDR is based on a new currency basket, containing five major currencies, which is used to determine both the value of the SDR interest rate. With effect from May 1, 1981, the SDR interest rate was increased from 80 per cent to 100 per cent of the combined market interest rate (the weighted average of short-term market yields in the five countries whose currencies are in the SDR basket). At that time, the reconstitution requirement on SDR holdings was also eliminated (with effect from April 30, 1981). These measures improved the asset quality of the SDR and enhanced the role of the SDR in the international monetary system. As a result, there has been further development of the private market in financial assets denominated in SDRs. The SDR has also been increasingly used by other international institutions, and most recently the International Bank for Reconstruction and Development, the International Development Association, and the Central Bank for West African States have been prescribed as authorised holders of SDRs.

With the final allocation (SDR 4 billion) for the third basic period at the beginning of 1981, there has now been a cumulative allocation of SDR 21.4 billion. The fourth basic period starts at the beginning of 1982. As of June 30, 1981, consensus with respect to SDR allocation in the fourth basic period had not yet been reached, and, as provided in the Articles of Agreement, the Managing Director has made a report to the Board of Governors and to the Executive Board indicating that as of that date he was not in a position to make a proposal regarding allocations during the fourth basic period that has broad support among Fund members. At its meeting in Libreville, Gabon, in May 1981, the Interim Committee urged the Executive Board to continue its deliberations on the subject to enable the Managing Director to submit to the Board of Governors at the earliest possible date a proposal that would command the necessary support among members. In reaching decisions on allocation, the Fund is guided by certain provisions of the Articles of Agreement, which require that there be a long-term global need to supplement existing reserve assets and that SDR allocations be consistent with the objective of avoiding economic stagnation and deflation as well as excess demand and inflation in the world. Moreover, the size of SDR allocations has significance for the objective of making the SDR the principal reserve asset in the international monetary system.

As has been discussed earlier, the rapid growth of non-gold international reserves that has occurred in recent year has primarily taken the form or large foreign exchange holdings. Accordingly the share of cumulative SDR allocation in total non-gold reserves declined from 10.5 per cent at the beginning of 1972 just after the last allocation of the firs basic period, to 6.6 per cent at the beginning of 1981. Past experience indicates that, with the expansion of internationa transactions in goods, services, and financial assets, further growth of international reserves is likely to occur. A large part of the total reserve increment wil certainly be generated through international financial markets. If a portion o the required reserve increment were, however, to take the form of allocated SDRs this could satisfy part of the rising demand for reserves without depending o international credit markets; it could als accommodate some tendency toward asset diversification without adding to existing pressures in foreign exchange markets and help to maintain the position of the SDR relative to other reserve assets in the international monetary system. In the present circumstances of the world economy, characterised by sluggish growth and entrenched inflationary pressure, it is of course important that decisions on SDR allocation avoid giving wrong signals to the private sector while aiming at the objectives discussed above.

Conditional liquidity

Members' quota subscriptions are the basis source of funds used for the extension of conditional credit by the Fund. A country making use of the Fund's resources is generally required to undertake an economic programme designed to achieve a viable balance of payments position over an appropriate period of time. The criteria for the provision of

Fund support are uniform for all members, in the sense that all members in a particular situation are entitled to receive the same treatment, given their needs and their adjustment efforts. The Fund recognises that to rectify a country's balance of payments position may, under present circumstances, require structural changes and that these adaptations may take longer than the one to three years normally set for Fund programmes. While macroeconomic policies must ensure that the demand for resources is kept in close balance with supply, increased attention has been devoted to the impact of policy measures on the incentives and the capacity to augment supply. To this effect, collaboration with the International Bank for Reconstruction and Development has been intensified. In addition, since payments imbalances are now often large relative to quotas, the Fund has taken steps to enlarge access to its resources. As a general norm, and apart from drawings under certain low-conditionality facilities, members may now use the Fund's resources up to 150 per cent of their new quotas in any year and up to 450 per cent over three years, with a cumulative limit of 600 per cent of quota.

To ensure that there are adequate funds available to support members' adjustment programmes, the Fund has periodically increased its quotas and, when necessary, made use of borrowing facilities. Quotas were increased by 50 per cent as a result of the Seventh General Review of Quotas, which became effective in November 1980. In addition to this general quota increase, some members had special increases, chiefly the major oil exporting countries. Most recently, the Saudi Arabian quota in the Fund was doubled to SDR 2.1 billion and the quota of the People's Republic of China was increased to SDR 1.8 billion. It has been decided that the Eighth General Review will be the occasion to review the criteria by which quotas are calculated and to reflect in the quota structure the evolution in members' positions in the world economy.

While work has begun on the Eighth General Review, it may be some time before the Fund obtains sufficient additional resources from quota subscrip-

Pakistan's explosive population growth

By B. M. BHATIA

LIKE many other Third World countries, Pakistan continues to face a serious demographic situation. The annual growth rate of population continues to be around 3 per cent which is among the highest in the world. The initial results of the 1981 population census of the country released at the press conference by the secretary, statistics division, Syed Munir Hussain, on July 29 this year, have come as a shock to those who had pinned their faith in the efficacy of family planning measures taken by the government and had hoped that growth rate of population would turn out to be no more than 2 per cent at the 1981 census.

The present census held in the first half of March this year, has been taken eight and a half years after the last census which because of Bangladesh crisis and subsequent separation of eastern wing from West Pakistan, had to be postponed from February 1971 to last quarter of 1972. The latest census shows that in the interval of 8½ years between the two head counts, 18.4 million persons have been added to the total population of the country. The increase works out at 28.8 per cent for the period or 2.98 per cent a year at a compound annual rate. This means that the earlier growth rate of 3 per cent per annum has been maintained and, population planning measures have failed to make the least dent into the problem of population explosion. If the population continues to grow at the present rate, the country might well have a population of 135 million by the end of the century. At the time of partition, population of West Pakistan which means whole of present Pakistan was only 51.2 million.

Another demographic feature underlined by the latest census data is the growing urbanisation of the country. The proportion of urban to the total population rose from 25 per cent at the last to 28.28 per cent at the latest census. The increase in urbanisation is not necessarily an indicator of economic progress of the country. At least not in the case of Pakistan. Urbanisation in that country is the effect of an unnatural expansion of tertiary sector that is unwarranted by the level of industrial growth there. According to the growth theory as well as all development experience, expansion of tertiary sector of an economy comes as a result of industrialisation and is a consequence of that development. In the case of Pakistan, the development of tertiary or service sector has preceded and outstripped that of industrialisation.

The share of tertiary sector in the gross domestic product at constant factor cost has gone up from 42 per cent in 1959-60 to 45 per cent in 1969-70 and 52 per cent 1979-80. Against that, the share of agriculture in the gross domestic product has declined correspondingly from 45.8 per cent in 1959-60 to 39 per cent in 1969-70 and 31.5 per cent in 1979-80. The share of manufacturing which includes small scale industries and traditional handicrafts has meanwhile moved up tardily from 12.2 per cent in 1959-60 to 16 per cent in 1969-70 and 16.5 per cent in 1979-80. Obviously, the tertiary sector has grown at the cost of agricultural sector and not as an end product of industrialisation which was the case with industrially developed countries.

Apart from that, urbanisation in a country which has a narrow industrial base has various other disadvantages. Pakistan at its inception, had only two big cities, Karachi and Lahore, and less than a dozen big towns. The population in most of these has grown five-fold over the last thirty years but the growth of civic amenities has been nowhere near even half that rate. Thus Karachi has now a population of 5.2 million (some say it is 10 million) compared to one million at the time of formation of Pakistan, and Lahore 2.92 million compared to 5 lakh in 1947. Faizabad (formerly Lyallpore) today boasts of a population of 1.09 million compared to little over one lakh at the time of partition. The story of Rawalpindi with its present population of 9,28,000, Hyderabad (Sind) 7,95,000, Multan 7,30,000 Gujranwala 5,97,000, Peshawar 5,55,000 Sialkot 2,96,000, Sargodha 2,94,000 and Quetta 2,85,000, is the same. Only Islamabad with a population now of 3,35,000 is a new city where civic amenities have been planned to correspond to the growth of needs for them over time.

Everywhere else, the growth of cities and towns in the country has proceeded in an unplanned manner with the result that population has everywhere outstripped the supply of such elementary amenities for the citizens as drinking water, proper drainage, adequate housing, health care facilities and schooling for the children. The old cities and the towns are now bursting at the seams. This not only causes severe strain on the public exchequer in finding funds for providing the ever-growing needs of the urban population but also generates economic and social tensions. Sind is the most urbanised of the four provinces of Pakistan; 43.4 per cent of its population was found to be living in urban areas at the 1981 census. At the other extreme are the two frontier provinces of N.W.F.P. and Baluchistan in

---

Prof Bhatia is a close student of Pakistan economy.

which 85 per cent of the population still is rural.

Punjab which is the most populous of the four provinces but has shown the lowest growth rate of population among the four provinces in the last decade, has 17.8 per cent of the population living in the urban areas. The following table shows the population at the 1981 census and the percentage increase in each case over the previous census figure in the four provinces, the Federally Administered Tribal Area (FATA) and in the capital city of Islamabad.

	Population (in million)	Percentage increase over 1972
Punjab	47.11	25 28
Sind	18.96	33 98
NWFP	10.885	29.77
Baluchistan	4.30	77.23
F.A.T.A.	2.175	N.A
Islamabad	0.335	42.55

More than 55 per cent of the population of the country lives in Punjab which is the most populous of the four provinces. The overall density of population for the country as a whole is 105 per square kilometre which is rather low. But this is accounted for by the fact that because of the rocky and barren terrain in N.W.F.P. and Baluchistan the two provinces are sparsely populated. The density of population in Baluchistan, for instance, is no more than 12 at present compared to 7 at the 1972 census. Against that, density of population in Punjab now stands at 229 compared to 183 at the 1972 census. The density of population in Sind which was 100 in 1972 has now risen to 134 and that in NWFP from 113 to 147.

Uneven distribution of population among the four provinces represents unequal distribution of national income and political power among them. Punjab has remained from the very outset, economically the most developed and richest, and politically the most dominant of the four provinces. Punjabis are the most articulate of the country's population and they form the biggest single element of the nation's ruling elite. This is one of the factors that inhibit growth of a true national unity and federal polity.

Land-man ratio in Pakistan is still far more favourable than in most of the neighbouring developing countries. Also a considerable amount of irrigation and power potential of the country still remains to be exploited. But the availability of large untapped resources cannot provide much comfort to the country's planners and policy makers. For one thing, these resources have been there with the country for the last 34 years. If little progress has been made so far in exploiting these, it is because massive investments are required to utilise the available potential. The funds needed for the purpose simply do not exist nor is there any hope for the country getting these from abroad. Secondly, the past performance of country's leadership in the matter does not encourage hope for the future. The untapped resources have been there "with us over the years, but the effort to harness them and accelerate the pace of progress has always been tardy", laments a Pakistan weekly. The country's leadership had all its development priorities wrong: it encouraged the development of consumer goods manufacturing industries which yielded for more than a decade spectacular growth rate results, but neglected agriculture in which the country enjoyed a considerable degree of comparative advantage over the neighbouring countries including India. There is no indication even now of the country having learnt its lessons from the failure of its past strategy of development and reversing its priorities in its development plans.

In the circumstances, population control policy acquires much greater significance and urgency today than ever before for the country. But the traditional methods of family planning would not do. That seems to be the latest thinking on the subject by the policy-makers. A new three year plan has, therefore, been drawn up and is being implemented. The plan aims at improving the living standard of the masses in the belief that such improvement would help to reduce the birth rate. The details of the core plan have not been published yet but it is confidently hoped that the "core" programme, which will be supplemented by the effort of each provincial government, will help raise the level of "effective knowledge" from 33 per cent to 55 per cent by 1984 and raise the level of current practice of family planning from an estimated 12.5 per cent to 25 per cent at the end of the three-year period. The plan aims at bringing down birth rate from the present 41 per thousand to 37.5 per thousand over the three-year period. The results of this novel experiment in Pakistan in population control through raising living standards of the poorer sections of the population will be watched with greatest interest by governments and peoples of the developing countries.

Soviet Union meets China in Nepal

By **BRAHMANAND MISHRA**

THERE was a time when in India as also elsewhere there existed a general belief that India was meeting China in little Nepal. In recent years, however, the situation appears to have changed drastically. Now, it is the USSR and not India which meets China in Nepal.

Till recently the Indian mission in Nepal—inclusive of personnel from both, the Indian Embassy and Indian Cooperation Mission—was considered the second largest Indian mission abroad, first being the Indian High Commission in London. But today India maintains only a skeleton staff of what it had there earlier. As a result the designation of the director of the Indian Co-operation Mission has changed. Now there is a liaison officer who functions not from Haribhawan but from the premises of the Indian Embassy with mere three hands in his office to assist him. The chief engineer of the erstwhile Indian Cooperation Mission (ICM) has been withdrawn. While the Butwal and Nepalganj circles are still there, the acting engineer made responsible to complete the remaining projects functions from New Delhi.

The net result has been that all the joint projects for which agreements between New Delhi and Kathmandu were reached during the Janata Party days are put in the cold storage. The handing over of Rs 10-crore Surajpura hydel project, built by Bihar Government across the Gandak river canal, under the Indo-Nepalese treaty of friendship has been against this background. On August 31, the Prime Minister of Nepal, Mr Surya Bahadur Thapa pressed a button to mark the formal taking over of the 15 mw-power house. Observers in Kathmandu believe there would be now many such handing and taking over functions in the coming months when, as was done on this occasion at an impressive function attended by ministers and diplomats be-

SOUTH ASIA REVIEW

sides 10,000 people, the historic ties binding India and Nepal would be reaffirmed.

India's quiet exit from Nepal has come at a time of Russia's entry into Nepal. The Russian entry has not been so quiet. The Nepalese mind became agitated this summer when *Jan Marg,* a Nepalese language weekly, came out with a startling story that the Soviet embassy in Nepal had brought into the kingdom two truckloads of powerful communications equipment. Later a German news agency quoting reliable sources reported from Kathmandu that there were actually four truckloads. The trucks had come from Calcutta accompanied by two Russians. Due to the suspicious nature of the cargo containing 84 crates, the Nepalese customs authorities at Birgunj, contacted the Nepalese Foreign Ministry. The shipment was detained for over two weeks while the matter was discussed at the ministry in Kathmandu and personnel from the Soviet embassy were rushed to Birgunj to keep a 24-hour watch over the consignment. The crates were reportedly released without customs inspection after the Soviet embassy presented a manifest which reportedly said that the crates contained construction materials for the embassy building which has been under construction for the past over three years.

It is said that the shifting of the Soviet embassy at Baluatar from Dilli Bazar was itself an after-thought after the Chinese had undertaken construction of their permanent embassy at Bhath Bhatenee, overlooking the huge flat land occupying hundreds of acres of Baluatar from where a large number of Nepalese farmers have been uprooted after the Soviets had bought it. On way to Baluatar. while one can see the Chinese embassy's main building because of the low walls—compared to its former building at Naxal, with a Chinese flag atop the building with one hundred rooms, the Soviet embassy at Baluatar, remains a closed show. The *Jan Marg* report had come soon after the detention of sophisticated communications equipment allegedly taken illegally into Bangladesh by the Soviet embassy in Dacca.

Incidentally the present ministry led by Mr Surya Bahadur Thapa is suspected of having a soft corner for the Soviet Union. It is said it was perhaps because of the Prime Minister leaning towards the Soviet Union that the entry of Mr Randhor Subba in the Nepalese cabinet was barred. After the grand success of the Partyless Panchayati group in the last general elections considering Mr Subba's experience and performance, political observers in Kathmandu took it as almost certain that the new government will name him the kingdom's foreign minister. Now it is said his entry was barred because of his known pro-Peking stand, which would not have been to the liking of Soviet Union.

What has forced India to withdraw from the scene quietly, the observers believe, is growing anti-Indian feeling, which was forcefully blown up under the primeministership of Kirtinidhi Bista in late sixties. At a time when polarisation of forces started taking place the world over, they say, for avoiding further embarrassment, New Delhi might have considered it safe to withdraw quietly. Whatever might have been the compulsions of New Delhi to take this step the fact that both India and Nepal have a shared destiny still remains unchallenged. According to Mr Bruno Knall, director, Sud-Asien Institute (Institute of South Asian Studies) Heidelberg, West Germany, Nepal's trade with India is by far much more important to it and there should be no politics or emotionalism in this respect. Mr Knall, currently a visiting professor at the Tribhuvan University, Kathmandu, has said that a spectacular increase in Nepal's trade wit
other countries was to a large extent du
to diversion of trade with India. Ther
is scope for more trade within the region, consumption patterns and qualit
expectations for products being simila
unlike in the case western countries. M
Knall felt that a better climate can b
achieved only if the Indian Government shows a more practical and development oriented attitude to Nepal i
matters of trade and cooperation and i
both the parties look at bilateral economic relations in a "more business-lik
manner". But one should not overloo
the fact that the bilateral trade is by fa
more important to Nepal than to India
Mr Knall suggested that Nepal shoul
evolve an integrated foreign trade polic
and dovetail the efforts at economi
diversification into it.

The foreign trade statistics sinc
1956-57 showed that trade with India
remained pre-eminent for many years
Nepal's trade with overseas countries
which was less than 5 per cent in 1968-69, however, increased approximately to 50 per cent in 1978-79. Trade with India
dropped resulting in shortage of Indian
currency and in 1978-79 Nepal's trade
deficit with India reached a new low of
Rs 106 crores.

Mr Knall has recommended that Nepal should import goods from India against direct payment of convertible foreign exchange. Imports from alternative sources had proved to be dearer because of the transport costs involved. Very few developing countries have the type of geopolitical constraints which Nepal faces. "The big brother" in the south had previously conceded exceptionally favourable terms of trade in its treaty with the Himalayan kingdom which are not yet made full use of; in the opinion of Mr Knall.

Bangladesh: Green revolution still away

From ZAKERIA SHIRAZI and ARSHAD MAHMUD

DACCA

THE green revolution in Bangladesh continues to remain a chimera, as distant as ever. Yet agriculture is the staple of the economy of Bangladesh and assumes a central importance in any programme aimed at making a dent in the abysmal poverty of this country (per capita income US $100). Agriculture contributes 60 per cent to GDP and supports 80 per cent people but the method of farming is still manual and archaic and yield per acre one of the lowest in the world (1,000 lb of rice per acre) even though the soil is fertile and the silt deposited by periodic floods further contributes to fertility.

Though the food gap has been significantly reduced during the last two financial years (July to June) due to good monsoon the country still has to import more than a million tonnes of food. The much heralded programme of doubling food production by 1985 has run into difficulty. The growing amount of government subsidy pumped into the agricultural sector has not only proved inadequate but has not improved

Pattern of land holding in Bangladesh—1977

Category of farmer	Size of holding (area)	Percentage of agricultural families	Percentage of agricultural land
Landless farmers	—	32.8%*	—
Marginal farmers	0.01 — 2.00	44.9%	25.1%
Subsistence farmers	2.01 — 4.00	12.7%	24.2%
Surplus farmer	0.01 — 10.00	6.9%	31.3%
Rich farmer	10.01 +	1.8%	19.3%

* In four years since the percentage of landless farmers is said to have grown sharply.

the condition of the masses of the peasantry because of the steady growth in the number of marginal, submarginal and landless farmers. The disproportionate amount of remittances from expatriate wage-earners (taka 340 crore annually—100 taka=Rs 49) has nearly unbalanced the economy and its resultant hyperflationary pressures have raised the price of agricultural land to impossible heights, forcing more and more farmers into landlessness and outside the pale of agricultural investment. Currently 50 per cent farmers are reported to be landless. However, due to liberal food subsidy it has been possible to stabilise rice price at around taka 6 a seer (a little less than a kilo).

Land utilisation is satisfactory and there is not much fallow land left to be brought under cultivation. Indeed forest areas are constantly under squeeze due to expanding agriculture thus threatening ecological balance. The net cropped area is 20,445,000 acres and 8,534,000 acres are sown more than once thus bringing the total cropped area to 28,979,000. Only 3,600,000 acres are irrigated by various methods.

Agriculture receives about 13 per cent of the total allocation under annual development plan. In 1978-79, for instance, taka 192.6 crore (13.1 per cent) was allocated for agriculture but 40 per cent of it was spent on subsidy for fertiliser and insecticides. Even with this heavy governmental subsidy producton is not rising significantly. One reason seems to be that the government food subsidy on rationing (which benefits only the 14 per cent urban people) tends to artificially hold down the price of agricultural produce, due to which the growers lose incentive.

In the current 1981-82 financial year, the total allocation on agriculture, irrigation and rural development is 996.40 crore takas which is 33.22 per cent of the total annual development plan of taka 3,015 crore including project aid of taka 1,000 crore. The allocation over these sectors is up by 27.2 per cent over the previous year's. One of the main goals of this programme is to attain self-sufficiency in food and to double food production by 1985. This year a target of 1,62,30,000 tonnes food production has been set up from last year's target of 1,48,00,000 tonnes. The other principal agricultural targets are: jute 63,80,000 bales, cotton 45,000 bales, sugarcane 60,45,000 tonnes and tea 9 crore pound.

To raise the yield of food and other agricultural commodities a target of distribution 12 lakh tonnes of chemical fertilisers has been set. The plan provides for distributing two crore saplings as a part of reforestation campaign. (At present a mere 9,283 sq miles are under forest *i.e.* 16 per cent of the total land area). Another objective of this programme is to yield 9.10 lakh tonnes fisheries through government and non-government efforts.

According to the programme the yearwise target food production up to 1985 would be: 1982—1,62,00,000 tonnes, 1983—1,73,00,000 tonnes, 1984—1,86,00,000 tonnes and 1985—2,00,00,000 tonnes.

Apart from the arrangement of financing and ensuring proper distribution of in-puts and other facilities 72 lakh acres of land are to be brought under irrigation from the present irrigated land of 36 lakh acres to achieve the goal. At the same time, 20 lakh acres of *aman* land are to be protected from the curse of floods and waterlogged areas are to be drained. Besides, experts believe that the use of high yielding variety (HYV) seeds has to be increased ninefold bringing it to 58,000 tonnes, the use of fertiliser in paddy cultivation must be augmented from the present 8,40,000 tonnes to 20 lakh in five years. Effective marketing and storage facility, enhancement of the carrying capacity and above all securing incentive price for the farmers are also important for the implementation of the programme. This is a tall order and there is some pessimism about the realisation of plan objective. As one agriculture ministry source put it, it is a pious wish proverbially unrealisable—at least within the time-frame.

Contribution to gdp by agriculture and other sectors

Sri Lanka : In search of communal harmony

From DALTON DE SILVA

COLOMBO

A RENEWED effort is being made in Sri Lanka to end racial tension, restore peace and harmony and find a peaceful solution to the grievances of the minority Tamils in the country.

The attempt being made by the leaders of the ruling United National Party (*UNP*) and the Tamil United Liberation Front (*TULF*) comes in the wake of last month's communal violence during which hooligans went on a rampage unleashing a wave of killings, arson, looting and rape. Several thousand people of Indian origin working in some of the tea and rubber plantations and some Indian businessmen were among the victims of the attacks aimed mainly at Sri Lanka Tamils.

Following a dialogue launched by President J. R. Jayewardene, the leaders of the *UNP* and the *TULF* agreed to set up a high level committee to find a solution to the minority problem which has erupted in communal violence on several occasions since 1956.

The committee under the chairmanship of President Jayewardene includes the Prime Minister, Mr Ranssinghe Premadasa, and ten Ministers of the *UNP* Government while the *TULF* is represented by its leader Appapillai Amirthalingam and two other members of Parliament. Two constitutional experts, are also on the committee.

The two sides have agreed that the committee will discuss all questions in dispute with a view to finding a peaceful solution. It will also try to persuade all political parties to co-operate and contribute to end all forms of violence throughout the country. In addition to taking other measures, the committee will also make efforts to ensure the proper and satisfactory working of district development councils.

The district development councils, established for the first time in June in each of the 24 districts in the country, are expected to satisfy some of the grievances of the minority Tamils by providing them a measure of autonomy in conducting the affairs in the districts in the north where they predominate.

The *TULF* is conducting a campaign in Sri Lanka and abroad for a separate state for the Tamils who comprise 11.4 per cent of the near 15 million population of the country. The *TULF* began its agitation for a separate "State of Tamil Eelam" in 1976 after governments since independence rejected its call for the establishment of an autonomous Tamil State within the framework of a federal republic of Sri Lanka.

Pressing their demand for a separate state, the *TULF* says that successive governments dominated by the majority Sinhalese have discriminated against the Tamils with regard to their language, religion, culture, education and employment.

The *TULF* also claims that it received a mandate from the Tamils at the last general elections in 1977 to work for a separate state when it won 17 seats in the Northern and Eastern Provinces and surprisingly emerged as the largest party in the opposition in the 168-member Parliament.

Successive governments dominated by the majority Sinhalese have vowed not to allow the country to be divided into two separate states. While rejecting the demand for a separate state efforts have been made in the past too to find a solution to the thorny problem. In fact, two agreements were signed. One was in 1957 between the late leader of the Tamils Mr S. J. V. Chelvanayakam and the then Prime Minister, Mr S. W. R. D. Bandaranaike, who was leader of the Sri Lanka Freedom Party. Another agreement was signed in 1965 between Mr Chelvanayakam and the then Prime Minister, Mr Dudley Senanayake, of the United National Party. Both these agreements could not be implemented due to political pressure from influential extremist groups.

Now everyone is watching anxiously the outcome of the latest moves being made by President Jayewardene to fin a lasting solution. He has an advantag over his predecessors in that his regim has already conceded some concessions t the Tamils in the Constitution that wa drawn up by his Government and adopted in 1978.

Government spokesmen point ou that the Tamil language was recognise as a national language along with Sinhala which continues to remain the official language of the country. It also provides that the language of the courts i the Northern and Eastern Provinces where most of the Tamils live, will b Tamil and records and proceedings wil be in the Tamil language. Fundamenta rights have also been inscribed in th Constitution.

The proper working of the distric development councils which will provide some measure of autonomy in distric administration is expected to be a key factor in the solution that is now being worked out by the high level committee. The two sides are also expected to agree not to make any moves or utterances that will rouse communal feelings.

Observers believe that inflammatory speeches and propaganda on both sides heightened communal tension which sparked the recent wave of violence. President Jayewardene himself chided members of his party recently accusing them of having spoken in Parliament and outside words that encouraged the violence.

The terrorist activities of a group of Tamil youth calling themselves "Liberation Tigers" have also contributed to the tension between the two communities. The "Liberation Tigers" movement proscribed two years ago, supports the *TULF's* demand for a separate state. The *TULF*, however, says that it has no connection with this movement. The terrorist group operating in the Jaffna peninsula in the north has been held responsible for a series of bank holdups, highway robberies and the killing of 21 policemen during the past four years.

The latest wave of violence was sparked off by an incident among school boys at a school in Amparai in the Eastern Province in early August. The violence soon spread to other areas in the Province. Hardly had the incidents abated there when disturbances were reported from towns north of Colombo. The worst affected was Negombo, 25 miles north of the capital where several Tamil shops were burnt and looted. The situation was brought under control with the assistance of airforce personnel called out from a nearby airforce station.

Violence then broke out in Ratnapura, the city of gems, in the central highlands. Here a gang of hooligans set fire to shops and looted them.

A gang of about 300 thugs also went in buses and attacked workers of Indian origin in the tea and rubber plantations in the Ratnapura and Balangoda regions. About 5,000 workers of Indian origin in the estates were affected. The damage caused to buildings, including the "lines" in which the labourers live, to vehicles and furniture in the estates was officially estimated at rupees 2.3 million. In addition to this considerable loss in production of tea and rubber was also incurred due to stoppage of work as the labourers had fled from the estates. The loss in tea production was estimated at one million kilograms.

A person from Madras who was in a party of pilgrims was killed in an isolated incident at Tissamaharama 100 miles south of Colombo. Sri Lanka's Foreign Minister, Mr Shahul Hameed, telephoned the Indian External Affairs Minister, Mr Narasimha Rao, and the Chief Minister of Tamil Nadu, Mr M. G. Ramachandran, and expressed the Government's regrets.

The violence was brought under control after President Jayewardene declared a state of emergency throughout the country on August 17, called out the troops to assist the police and promulgated emergency laws imposing severe punishment on lawbreakers including the death penalty for arson and looting.

30 millon acres of surplus land

From ARVIND BHANDARI

New Delhi

THE disgustingly slow progress in regard to implementation of the land-to-the-tiller policy provides a glaring example of the wide gap between precept and practice in this country. In the last three decades since independence only one-third of the five million acres of surplus land has been distributed to the landless labourers, according to the statistics of state governments. But, to make matters worse, now comes the revelation that these statistics are unreliable. The National Sample Survey estimates that the surplus land in India is 30 million acres and not five million acres.

A further problem is that those among the under privileged who are allotted land often become dispossessed. Take the case of Haryana. The Chief Minister, Mr Bhajan Lal, recently admitted that certain influential people had tried to dispossess the allottees of surplus land in the State. Haryana has been trying to take the lead in the country in the allotment of surplus land to the landless, and the Government is anxious that further "overt and covert" grabbing of panchayati land should be checked in the public interest. The Chief Minister has instructed officials to take strict action against guilty landowners. Outright purchase of holdings from petty allottees who do not find farming remunerative, and pressure tactics to compel the small and marginal farmers to part with their lands, are familiar phenomena.

The surprise is that, despite all the plus land and of granting full protection to petty peasants in the unequal battle they wage against medium and large landowners, the grabbing operations have continued. The Chief Minister has admitted that this is a poor reflection on the State administration.

Admission of such transfers is not enough. Officials and others who have colluded in these deals need to be adequately punished. Although the Chief Minister has asked revenue officials to be alert, considerable damage has already been done. Speedy action is called for to cancel illegal transfers and restore the land to the original allottees; otherwise the aim of distributing surplus land to the landless will be defeated. It is also uncertain how much of the 1.30 lakh acres recently allotted to the weaker sections of society has remained with deserving people.

Irregularities are suspected in respect of urban land also. For instance, the State Government's decision to allow private colonisers to develop land for residential purposes around Delhi had led to much criticism because of the avenues for profiteering and other malpractices which the plan opens up. There is already talk of a "multicrore land racket" in the region. Land values around Gurgaon have risen by about 300 per cent in the past three months. Another report indicates that political considerations have weighed with the authorities in the acquisition of land near Hissar. Certain ministers are stated to be on a plot-grabbing spree in Haryana urban estates.

Slow progress in regard to acquisition and distribution of surplus land is often attributed to litigious hurdles. This may to a certain extent be true but cannot serve as a fig-leaf of lack of political will and administrative lethargy. What is happening in Haryana roughly mirrors the situation in the country as a whole.

IMF REPORT 1981

Concluded from page 499

tions. Given the current high rate of use of Fund resources it is anticipated that the Fund will need to undertake supplementary borrowings of the order of SDR 6-7 billion a year over the next two or three years. In the first half of 1981, the Fund has concluded borrowing arrangements with the Saudi Arabian Monetary Agency, under which the Fund will be able to borrow up to SDR 4 billion in each of the next two years, with the possibility of additional amounts in the third year. In addition, the Fund has made arrangements for short-term financing of about SDR 1.3 billion from central banks of 16 industrial countries. About one half of this amount is available under a borrowing agreement with the Bank for International Settlements and the remainder under direct bilateral arrangements with the 16 central banks. These resources will contribute to financing of country programmes under the Fund's policy of giving members enlarged access to its resources. While the Fund is exploring further bilateral borrowing arrangements with members and central banks of members, it may also have recourse to the private capital markets, if indispensable to finance continued expansion of its operations.

China: Changing banking scene

Concluded from page 494

China's sole foreign exchange bank, seemed to have slowed down its hectic pace of activities this year. The only new branch scheduled for opening in 1981 was New York which will be an addition to 77 branches in China and a network in Hongkong, London, Luxembourg, Singapore and Tokyo.

In December 1980, BOC's articles of association were amended clearly defining the bank's role and its ownership, with a view to meeting some of the objections raised by international law firms advising western banks over loan risks. After the revision BOC became a state-owned bank as a few of the privately-held shares were bought up from the overseas Chinese. W[illegible]being state-owned it remains a distinct entity from the state, thus not making international loans to BOC a sovereign risk.

BOC's legal status to borrow money from foreign sources is specifically described in the new articles and its scope of activities has been widened and more clearly defined.

BOC and other Chinese financial interests had since 1979 formed joint venture merchant banks with United States and Japanese interests. These were set up with the intention of channelling funds to joint venture projects or foreign investments mainly in China. While keeping an eye on luring investors to China, these banks have branched out into other money making activities. For instance CCIC Finance, a joint venture between Bank of China, First National Bank of Chicago, Industrial Bank of Japan, and China Resources, has diversified into foreign exchange dealing, Hongkong and regional loan syndication and consultancy services earning hefty fees.

On the other hand, Kincheng-Tokyo Finance, a joint venture merchant bank — the partners being Bank of Tokyo, Bank of China and Kincheng Bank, which has strong Shanghai connections — stuck largely to regional loan syndications with a loan portfolio of HK $ 300 million in the six months to March 1981. Although both these merchant banks were formed specially in view of their American and Japanese partners, to lure investment into industrial and commercial ventures in China, they have been given a go ahead to pursue interests unrelated to the Chinese economy.

While China's banking activities abroad were diversified and expanded with sure signs of more to come domestically the banking structure came under tighter controls during 1980-81. This was because of heavy budget deficits suffered in 1979 and 1980. These deficits were largely caused by uncontrolled capital investments and larger money in circulation due to wage rises to workers and better prices for farmers for their output.

Therefore, early this year new instructions were issued by the Ministry of Finance and the PBOC to tighten loan conditions. Any enterprise which could possibly be earmarked for closure owing to the policies of retrenchment was not eligible for loans and the bankers were instructed to strictly police all loans to ensure that working capital was not switched to capital construction by individual enterprises.

Since 1979 many individual trade and industrial corporations were allowed to keep a part of their export earnings instead of turning them over to the state. Many of these firms had kept accounts in foreign banks. In early 1981, all such firms were directed to bring back all foreign monies to Bank of China branches, so that authorities could keep an eye on the flow of foreign exchange.

In addition to such belt tightening, the central Chinese leadership issued in early 1981 treasury bonds worth 5 billion yuan (US $3.3 billion) to make up part of the 1980 budget deficit. All collective and state-owned enterprises, as well as individuals were encouraged to subscribe to these bonds. In the early 1950s, Peking had issued state bonds, but only wealthy individuals—former capitalists—were required to subscribe to those, which were paid back in 1958. (The 1979 budget deficit of 17 billion yuan—US$11.3 billion—was covered by merely printing more currency.)

Despite domestic bonds and other austerity measures, China resorted to a loan of US$550 million (equivalent of 450 million SDRs) from the IMF in 1981 to meet its balance-of-payment deficit. The World Bank chipped in another US$200 million to support higher education in China, with the money going mainly for such hardware as computers and scientific equipment.

Also in the business of raising bonds were Fujian and Guangdong provinces, which have strong connections with overseas Chinese in Southeast Asia and North America. These bonds range from 500 yuan to 50,000 yuan, with maturities of eight to 12 years and interest rates of six to eight per cent. The bonds being tax free, Chinese citizens could subscribe to those with foreign currencies arranged by their relatives abroad.

In raising money from capital markets abroad, this year China also initiated plans to issue yen-denominated bonds in Japan. China International Trust and Investment Corporation (*CITIC*) made plans to issue between 10 billion (US$48 million) and 15 billion (US$72 million) yen debentures. *CITIC* is China's official arm to lure foreign investment into the country. The Japanese issue was being prepared by Nomura Securities, Daiwa Securities, and Bank of Tokyo. The money raised through the yen bond issue is to be used mainly to develop China's coal and non-ferrous metal resources.

However, the major source of capital in foreign currency will have to come from foreign governments and related agencies and from international commercial banks. In their flurry to woo the newly emerging market of one billion people western governments and Japan offered direct credits, some arranged loans from their Exim banks, and large commercial banks followed suit. By 1980 over US$26.2 billion worth of credits were committed to China by OECD governments and western and Japanese private banks. However, China's draw down amounted to barely 10 per cent of the total offered. The problem was, as the Chinese have learned through hard knocks, large scale input of technology needs a lot of infrastructure, skilled man-power and the progress of other sectors of economy in tandem with the sectors in which new technology is poured in.

Even without additional external input, the Chinese economy was becoming overheated. While a lot of money was being wasted on unplanned, uneconomic, low-priority ventures, the country could not find the domestic resources even to improve rapidly transport bottlenecks. The over US$2.5 billion worth of projects—mainly Japanese, US and West German—which were cancelled in 1980, were to a large extent due to the Chinese not being able to put up RMB capital and the necessary infrastructure for these large scale plants. Instead, the Chinese leaders have been trying to interest the foreign sellers of these plants to enter into joint ventures to pursue these projects.

Thus China is taking the slower road to modernisation—a policy called readjustment and retrenchment—in

Extension of crop insurance

By **ARVIND BHANDARI**

CONSIDERING the hardship faced by farmers on account of loss of crop, the Government's decision to extend the crop insurance scheme to cover about five lakh hectares spread in 100 districts during the Sixth Plan period is well-conceived. The areas to be covered by the scheme will be selected by the General Insurance Corporation (GIC) in consultation with the Ministry of Agriculture and Co-operation and the state governments concerned. The pilot crop insurance scheme was introduced in the country in 1979 in three states — Tamil Nadu, Gujarat and West Bengal. It covered 13,181 hectares, involving 16,268 farmers. The total sum insured was Rs 1.30 crores and Rs 5 lakhs was collected as premium. During 1980-81, the scheme was extended to Maharashtra. The area covered by the scheme was increased to 18,703 hectares, involving 23,442 farmers. The total sum insured was increased to Rs 1.65 crores and Rs 6.9 lakhs was realised as premium. Nine more states—Haryana, Himachal Pradesh, Andhra Pradesh, Kerala, Karnataka, Madhya Pradesh, Orissa, Rajasthan and Uttar Pradesh — have also decided to implement the crop insurance scheme. Under this scheme, which is voluntary, the GIC and the state governments are co-insurers : the state governments' liability being 25 per cent of the premium and indemnity. The GIC has earmarked Rs 6.50 crores for this scheme. Out of this Rs 4.87 crores is the GIC's share and Rs 1.63 crores that of the state governments. The Ministry of Agriculture will provide assistance to the tune of Rs 20 crores to the GIC for setting up a crop insurance fund to enable it to meet the expenditure on the extension of the scheme. The state governments have also been requested to earmark funds for the scheme.

Helping tribals

A quick tour of the eastern region, which took me through parts of West Bengal, Bihar, Orissa and Madhya Pradesh, has left a few impressions which seem to be worth sharing. One, Calcutta's man-pulled rickshaws are an abounding disgrace, bearing an eloquent testimony to the continuing apathy and insensitivity of man to the degradation of fellow man. It does not subscribe to the Marxist credentials of the West Bengal Government that by turning a blind eye to the this eyesore on Calcutta's streets it should collude in such exploitation of the worker class. Some perfunctory queries gave the impression that the authorities are ignoring this malaise because the rickshaw-pullers, mostly Biharis, constitute a small vote-bank for CPM. Politics on the ground invariably exacts a toll from idealism. Two, now I know what people mean by the disparaging remark that no government exists in Bihar. Dhanbad is the nearest railhead for Bokaro, which is about 30 kilometres away. In order to reach Bokaro you have to cross a longish bridge over river Damodar. Quite some time ago this bridge was declared "unsafe". But construction of an alternative bridge a little upstream, undertaken by the Hindustan Steelworks Construction Limited under the supervision of the State Government, has been inordinately delayed. In the meanwhile, to prevent a disaster, the authorities have sought to "strengthen" the bridge by paving the surface of the road strip on it with wooden beams. This has made the road strip so uneven that frequently heavily loaded trucks break down midway on the bridge, with the result that not only a vital line of communication is disrupted but also that dozens of vehicles are left stranded precariously over a bridge which might collapse any time. I learn on good authority that the State Government, despite the urgency of the situation, is going about in its usual slothful, sluggish ways. Perhaps Jagannath Mishra is waiting for a Baghmati to occur at Damodar. Three, Rourkela provides an example of the gratifying results that can be achieved if an organisation makes even nominal efforts to bring the surrounding tribal population a bit nearer civilisation. A small-built, ebony-skinned people, mostly Hindus but having a sprinkling of Christians, the tribals are being helped by the steel plant authorities to help themselves. Apart from being rendered some direct assistance, the tribals are taught how to secure bank loans to start vocations. I visited three villages to see this peripheral development programme. Nuadara is populated by Santhals and Mundas. The spick and span huts made by them with just straw and mud are truly amazing. Pottery seems to be the popular vocation, but some tribals go to the plant to work as contract labour. The authorities have provided a school building. The tribals of Jobaghat are being encouraged to make paper pulp. A co-operative society assists them in the supply of raw materials like waste paper and discarded clothes as well as in marketing. In Jamsera village it is poultry farming that is gaining popularity, with 16 sheds already having been set up. The plant authorities are lending support in the form of guidance to secure loans from the Bank of India, veterinary services, insurance and collection and transportation of the produce. Each poultry farmer pays Rs 50 to the bank every month as instalment repayment.

Return of native

The Chief Minister of Haryana, Mr Bhajan Lal, recently invited some journalists to Haryana Bhavan for a luncheon and, surrounded by a few officials, announced his assessment that overseas Indians were eager to set up industries in the State. He brandished a sheaf of papers which were supposed to be application forms given to him by the Indians he met in Britain, the USA and Canada. Mr Bhajan Lal's expectation is that about 250 to 300 overseas Indians will eventually come forward to invest in Haryana. For this purpose a Haryana State Infrastructural Development Corporation is to be set up, and arrangements are being made to give single-window clearance. Also, 20 per cent of the plots to be developed by the State Government for residential and industrial purposes will be reserved for overseas Indian investors. The Indian Investment Centre, whose job it is to promote foreign investment in this country, has branches in the countries on which Bhajan Lal and party descended. Complacency would, however, be unwarranted. Only a few days ago Britons of Indian origin, participating in a symposium organised by the London branch of the Indian Investment Centre, castigated the licensing and controls policies of the Government of India. The overseas Indians pointed out that because of the recession in the West machinery was available at cheap prices for being brought to India. But before that the "hurdles" must be removed. They have a point.

DATELINE NEW DELHI

BOOKS & IDEAS

Facets of innovative banking

Current Trends in Indian Banking—Volume I

By B. Ramachandra Rao

Suneja Publishing Corporation, B-4/29, Safdarjang Enclave, New Delhi 110 029; *First Published in* 1981; *Pages* 217; *Price not mentioned.*

'Current Trends in Indian Banking' is a collection of articles which were published in banking and financial journals. Each article forms a chapter of the book which consists of 35 chapters in all. The book is primarily meant for bankers and others concerned with the development of banking. A wide range of issues related to the development of banking have been discussed by the author. At the appropriate places, he has put forth valuable suggestions to tackle the various problems which crop up in banking development and administration.

The concept of development of banking which had a restricted meaning prior to nationalisation needed redefinition in the changed circumstances. Banking development was regarded as a 'synonym' for deposit mobilisation at that time. Now it is a multi-dimensional concept which aims at the development of the economy of the places served by the banks by developing "everything that is possible to develop at micro as well as macro levels". The other development related problems are discussed by the author under various chapters the most important ones being the following: the concept of development in banking, some thoughts on business development of bank branches, the role of manpower in banking development, and banks and small scale industries.

In recent years, the banks led by the public sector banks have introduced various special schemes to serve the society in a much better and bigger way as compared to pre-nationalisation days. The author evaluates 'lead banking', 'district credit plans', 'differential interest rate scheme', 'small loans against DICGC (Deposit Insurance and Credit Guarantee Corporation) cover,' 'credit authorisation scheme', 'participation certificates' and 'rural banking' which are the important schemes introduced by the banks to achieve the above-mentioned objectives.

The author has also chosen to deal with the usual problems faced by all bankers such as those related to deposit mobilisation, recycling of resources, bank loan and write-offs, over-time payments in banks, changing of banks by the customers and branch level profitability. He emphasises the roles of staff involvement and deposit oriented advances as the two keys for a pragmatic approach to mobilise deposits. From the points of view of resources constraints as well as profitability, faster recycling of resources is significant to banks. With increasing levels of participation by banks in the developmental activities through lending under the various special schemes, recovery problems have assumed larger dimensions.

The author has made many suggestions including the restructuring of the pattern of credit, review of the portfolio of the banks' investments and formulation of dependable procedures for projecting and monitoring credit flows to tackle the problems of overdues and recoveries. He has taken exception to the undue publicity being given to overtime payments in banks. It is pointed out that it is difficult to precisely measure the load of service-related work done perceptibly and tangibly in a service industry like banking in contrast with that in production oriented industries where the additional output produced out of overtime payment can be identified.

Everything is said to be time-bound in banking. Things should be up-to-date on day-to-day basis and *ad-hoc* figures and statements called for should reach the head offices promptly which result in overtime work in the branches. Nevertheless, the author has listed certain restrictive practices by the employees which are responsible for overtime work and also made useful suggestions to tackle the problem of overtime payments.

It is reiterated in the book that unless there is a proper reason, customers do not change banks. The provision of personalised service is emphasised to prevent the changing of banks due to dislike between banks and customers. After the nationalisation of banks an impression is gaining ground that each branch does not need to bother about making profits. Howev the author categorically states oth wise. According to him it is necess that branches earning profits sho continue to do so and branches in red should be brought on the pr side by deliberate efforts by the hig authorities.

Valuable efforts have been ma in the book to throw light on some the innovative fields in banking su as lease financing and factoring. Le ing is a very important and attracti branch of term finance. There are t dimensions to lease financing—where person gets plant and equipment use on rental basis for his enterpri without purchasing them himself a where a person wants to buy pla and machinery for hiring to othe against regular rents. Banks may able to make a big dent in industri financing through lease financing areas such as fishing, road transpo shipping etc. Another area quite ne to Indian banking is factoring which primarily concerned with the collecti and financing of receivables/book deb on behalf of manufacturers or selle of goods and services. Those ban which are already engaged in financin of hire purchase and instalment sellin business or lease financing may find easier to develop factoring.

The book also deals with moder tools of analysis such as performanc budgeting in banks and cash plannin by borrowers. The underlying idea to project the business in advance fo every branch and then to work to reac the target set before the date set fo it in each year. Each branch is aske to submit its performance budget fo the next year in relation to its perform ance in the past and based on the poten tiality in the command area of th branch. The regional office in consul tation and co-ordination with the branc itself and in the light of the macro level target fixed by the head office fo the region finalises it. According to th author, performance budgeting is bein taken as a ritual by the bankers an the spirit behind it is not properl understood and translated into action Similarly, cash planning, an importan financial management tool, has not ye received its due acceptance among th borrowing companies, laments th author.

One of the drawbacks of the boo is mentioned by the author himself i the preface to the book. The article which were published from time t time were not updated when convert as chapters purportedly "to retain th historical value". Another drawback i that as each article was written indepen dently of each other, repetitions ar

undant. It is hoped that while
nging out volumes in respect of his
ure articles, these aspects will be
en due attention. On the whole,
book is a valuable addition to the
rature on principles and practice of
king.

World agricultural production has
n steadily increasing for many years
v with the exception of 1972 when
duction did not rise. The major
t of agricultural production is ac-
nted for by cereals which supply 52
cent of the protein requirement of
world's population and 65 per cent
the world's edible dry matter. The
ld production of wheat, rice and
ze, which together supply half the
l food, has more than doubled in a
od of less than three decades—pro-
tion of rice by 154 per cent, wheat
144 per cent and maize by 171 per
. The per capita food production
during the seventies in the deve-
d countries; it also rose in Asia and
th America but fell in the African
ntries. The total grain deficit of
developing countries has been
ening over the years and is expected
each 50 million tonnes in the next
or five years. Considered against
foodgrains production of 730
ion tonnes of the developing coun-
the shortfall of 50 million tonnes
not appear to be significant, but
fact is that the present level of con-
ption in the developing countries
es a very large number of people
ernourished and that means that to
the real needs of the population in
developing countries the production
odgrains needs to be increased by
much more than 50 million tonnes.

An analysis of the factors promot-
production of foodgrains shows that
about a quarter of the increase in
uction was contributed by an in-
e in the acreage under cultivation,
e as much as three-fourths of the
ase was made possible through an
sification of production—an in-
ed crop yield per hectare. It has
estimated that on an average one
tivated land in a developing country produced 10 kg grain. With high yielding varieties of seeds the yield can be still higher. Data for crops other than cereals are not available, though. Nevertheless, the role of fertiliser in increasing food supplies of the developing countries comes out very clearly from these figures.

The issue consists of articles, previouly published and freshly written, on the fertiliser industry and technology. The bulk of the contribution is made up of the papers submitted to the seminar organised by the Fertiliser Association of India (FAI) which are also available in a handy form in a publication brought out by the FAI itself.

Some of the contributions supplied by the foreign authors are not easily available in India. They deal with fertiliser production processes and the position of developing countries in fertiliser availability and use.

Inasmuch as all the writers are knowledgeable in their subjects this collection of articles on fertilisers is a dependable source of reference.

Subhash Chandra Sarker

Unto the last

IN an article in *Ceres*, published by the Food and Agriculture Organisation, Mr Pran Chopra, an Indian journalist, discusses how the *Antyodaya* movement has succeeded in bringing benefits of state policy directly to the poorest of the poor in Rajasthan.

Mr Chopra writes: "There were problems to begin with, not the least being well-based skepticism about politicians' interest in the welfare of the poorest. Haste added some, as with insufficient preparation the Government insisted on launching the programme on Mahatma Gandhi's birthday, October 2, in 1977. Some undeserving families were selected, some given loans without proper testing, the target of five families per village proved to be unrealistic and had to be changed to between three and seven, depending upon the size of the village. But extensive random sampling in different types of villages as well as cross-checking of aggregate information convinces me that *antyodaya*, as operated in Rajasthan, which is an area as large as many countries are and has a population of nearly 26 million, has passed a number of very important tests.

"The first test is the spread of the programme. It has penetrated the remotest tribal villages I visited, and I accept as valid the Government's claim, also corroborated by other evidence, that on an average five families were annually selected in each of the 33,000 villages in 1978 and 1979—except where none were found to be below the poverty line—and, perhaps with some time lag, were also given due assistance.

"The second test concerns the earnings of those assisted. Not only some means of livelihood have been given to those who had none, but the earnings of most of the people I met have risen well above the poverty line and are not far from the *per caput* income in India. By that, I mean net earnings, after operational needs have been met and loan instalments repaid with interest. Apart from the scattered human examples, there is the telling aggregate evidence provided by local bank managers that the borrowers—poor, ignorant and new to money though they be—have a high 80 per cent record of repayment, which apart from certifying their good conduct as borrowers proves satisfactory profit-making.

"The third test has to do with the social quality of the operation. Apart from spreading knowledge about modern money management and such newfangled institutions as livestock insurance, it is making religion and caste barriers more flexible. In many villages, very low-caste families are proportionately more numerous among the *antyodaya* beneficiaries than in the village, which shows that compassion rather than caste interests determined the choice of families when the village met. The only Hindu in a village was among the beneficiaries chosen by Muslims, and examples of this kind are numerous.

"Nevertheless, I have two doubts regarding *antyodaya's* future. One relates to the perversity of politics. When a new party comes to power it sometimes scuttles programmes, however, popular and beneficial, which were feathers in the cap of the outgoing party, not realising that the credibility of the political process as a whole might be thus imperilled. This can happen to *antyodaya* also.

"My second doubt relates to the existing state of social dynamics. The most powerful classes in India's mass politics today, whether urban or rural, are neither the very rich nor the very poor but the middle and lower middle classes. But, while the very rich have only to suit their ends, the poor have only their numbers, and their numbers are not sufficiently organised as yet on their own behalf, especially in rural politics."

Problems of shipping

By P. C. MAHANTI

EASTERN INDIA TODAY

AT the annual meeting of the Foreign Trade Association (Eastern India) the subject of shipping difficulties that this region has been facing was highlighted. The chairman, Mr S. N. Kukreja, focussed on the fact that freight to most destinations in the world from the east coast of India is higher than that from the west coast and being much higher than what the competitors have to pay imposed an additional disability on exporters here. The shipping facilities are equally tardy with frequent changes in shipping schedules, delays in the docks besides protracted transit times. Although containerisation is developing in the region in a satisfactory way there is no perceptible freight advantage. Calcutta port's working has noticeably improved during the last eight or nine months but the infrastructure for the Calcutta-Haldia port complex has not developed adequately yet. Incidentally the Russians are again taking a keen interest in the development of a full-fledged and regular container service from Haldia. A Soviet line, the Black Sea Steamship Company, introduced a service from Haldia last year but withdrew only after four months of operations. Instead it has been running a regular service from Calcutta now.

The only company which runs a fullfledged container service from Haldia is CGM, a French shipping line. The Shipping Corporation of India service to Australia and New Zealand is not fully containerised but it has plans to introduce a service to African ports in the near future. If the Russians come back again, as they are reportedly planning to do—a Soviet delegation is coming to Calcutta soon to examine the possibilities and prospects—then Haldia's container facilities will be fully utilised and there will be a healthy increase in the port's traffic.

Incidentally Calcutta port has been doing steadily well in the container traffic that now operates from here. During August the port authorities claim a record 2,517 containers were handled as against only 539 in the same month of last year. The Port Trust authorities also claim that labour productivity in this particular field has improved to an unrecognisable degree. As many as 65 containers were stuffed and destuffed in a day during last August compared with only 20 to 25 in earlier months. If the infrastructure, including roads and entrances, improves further productivity is likely to spurt even more dramatically.

LIC's investments

Eastern India may have some justification in complaining that public financial institutions, by and large, have not done justice to its needs but that complaint would not apply to the Life Insurance Corporation—if the figures released by the corporation on its investment in the region are correct. The LIC's investments in the country during the past 25 years of its life is Rs 3,823 crores out of which it has invested Rs 675 crores in the eastern region. Percentagewise the ratio to the total is 20.6 and that is quite good.

Of Rs 675 crores as much as Rs 202.94 crores has been given as loans to the state electricity boards. The highest amount of Rs 80.75 crores has been given to the West Bengal State Electricity Board. The Bihar board gets Rs 51.83 crores, and those of Orissa and Assam Rs 47.40 crores and Rs 14.30 crores respectively.

The corporation has also invested as much as Rs 84.67 crores in housing. The various state housing boards have benefited from these loans, West Bengal again being the biggest beneficiary. The State received Rs 30.19 crores followed by Orissa with Rs 26.63 crores and Bihar with Rs 19.91 crores. Assam comes last in the list with Rs 4.61 crores. Industries and co-operative societies have received Rs 37 crores. Drinking water schemes in urban areas received Rs 6.66 crores and State transport corporations Rs 3.5 crores.

Cement project

In the course of a recent visit to Orissa it was interesting to learn that Arab investors are eyeing a ceme project in the State. Negotiations a going on as to financing and producti sharing etc but if its goes through will probably be the largest unit eastern India with an eventual capaci of two million tonnes of portla cement. The State Government auth rities through the industrial developme corporation have applied for a letter intent as well as the lease for lim stone mines in the area which has be chosen as the location for the plant. Finnish company and an Austrian o have shown interest in making fer chrome and press reports have it th the project has been finalised. T State's abundant raw material resou ces remain largely unexploited. It one of the merits of the industrialis tion drive launched by the prese ministry that investor interest fr within the country and abroad is bei increasingly attracted to Orissa. T Finnish and Austrian companies in th case are Outokumpu of Finland a Voestalpine of Austria both mining a steel interests.

A SURVEY ON STEEL INDUSTRY

A view of the Bokaro Steel Plant

Infrastructure for steel

By ARVIND BHANDARI

IF per capita consumption of steel were to be the criterion of development, India would have the dubious distinction of occupying one of the lowest rungs of the economic ladder. This country's per capita steel consumption at about 14 kilograms compares miserably with that of Japan at over 75 kilograms.

In spite of the present aberration in the form of glut of certain items, which would be explained later, the demand for saleable steel, in a general sense, remains ahead of supply. For the current year the demand is estimated at 10.5 million tonnes whereas the targeted production of the integrated steel plants (including TISCO) is 7.3 million tonnes plus another 2.50 million tonnes from mini-steel plants. At the end of the Sixth Plan (1984-85) and Seventh Plan (1989-90) the demand is estimated at 12.7 million tonnes and 18.4 million tonnes, respectively. On the other hand, the steel ingot production capacity of the integrated steel plants, including TISCO, is projected to be expanded from 11.4 million tonnes to 14.6 million tonnes by the end of the Sixth Plan and 20 million tonnes by the end of the Seventh Plan. Since yield of saleable steel is generally 70 to 75 per cent of the ingot production, it would mean that even at the end of the Seventh Plan supply of saleable steel will lag behind the demand. A working group of the Planning Commission estimates that between 1984-85 and 1989-90 steel imports would have to be made ranging between 1.6 to three million tonnes.

Considering the steel industry's close dependence on the availability of power, coal and railway transport, it is necessary to emphasise that mere expansion in capacity would be meaningless without matching increases in infrastructural support. For example, between now and 1989-90 the requirement of coking coal will go up from 17 million tonnes at present to 34.5 million tonnes and that of non-coking coal from 3.3 to 6.6 million tonnes. Requirement of inward railway freight movement of raw materials will go up from 45.9 million tonnes to 96.3 million tonnes. Outward railway freight movement of saleable steel and by-products will go up from 10 to 23.5 million tonnes.

Steel production capacity is to be expanded through expansion and modernisation of the existing steel plants as well as establishment of new plants. Work on modernisation and expansions is behind schedule. This will be taken up in some details subsequently in this article. Progress regarding establishment of new plants is also behind schedule, the magnitude of delay being different for different projects. Major units of the Salem steel plant, which would be a sister unit of the Durgapur alloy steel plant, recently had a trial run. The Salem project is due for commissioning in mid-September. As regards the Vishakhapatnam project, land has been acquired and site levelling and excavation work are in progress. The first stage of the project will be completed in 48 months from now or by mid-1985. The Vishakhapatnam plant will produce 1.5 million tonnes at the first stage and 3.5 million tonnes at the second stage, which is to be completed during the Seventh Plan. The total cost of the project is estimated at Rs 3.000 crores. The Vijaynagar steel project has been cleared by the SAIL board following submission

THE GOOD
EARTH

AND INDEED ROURKELA HELPS GOOD THINGS GROW ON IT

The earth. Green and gold. Nurtured by rain, sunshine and human beings. Bountiful. Treasure-house of unplumbed wealth. From the fish in the waters to the lofty tree-tops. From the metals underground to the rich loam of the crust.

Many good things grow on this good earth of ours. Primary among them being food. Sustenance of man.

To-day, man aided by scientific advancements has put technology to work. Helping good things grow better.

Take farming for example. Bountiful harvests have become routine. Food production has increased ushering in green revolution to meet the increasing demand of a growing population.

Increased mechanization, better fertilizers, pesticides, modern farming equipment like tractors and power tillers, food-processing plants. packaging for year-round availability, transportation-tracts, railways, ships, automobiles to reach food to the people.

All these have developed and matured under the wings of modern steel production. Steel to make machines, machines to farm, process transport. Machines to make good things grow.

Rourkela Steel Plant, one of the most sophisticated steel producers in the country, is helping the entire agricultural scene directly through CAN fertilizer 'Sona' from its huge fertilizer complex and indirectly through various categories of steel for various agricultural implements, steel for pipes for tube wells and water transport, steel for power industry to help better irrigation and steel for trucks, trains and ships to enable quicker movement of food grains.

Rourkela helps things to grow better still on the good earth.

STEEL AUTHORITY OF INDIA LTD.
ROURKELA STEEL PLANT

RSP/PA-80/79

of a preliminary report by Metallurgical Engineering Consultants India Ltd (MECON). This project is also slated to have a capacity of three million tonnes.

The Paradip file is going the rounds in the corridors of power in New Delhi, with the British Steel Corporation and Mannesman-Demag vying for the steel project. The British public sector company is reportedly very keen to get the contract, so much so that the Thatcher Government almost regards it as a prestige issue. I learn from reliable sources that, in the view of the Indian High Commission in London, the British economic aid to India could be adversely affected if the contract were to be denied to BSC. Impartial observers point out that the BSC is at present running up huge losses and a company in such a poor financial condition can hardly foster confidence. In terms of technology also the Germans, who built the Rourkela plant, are regarded as superior. While these pros and cons are being debated the ultimate cost of the project continues to rise. One opinion, which springs more from concern for political sensitivities rather than technological considerations, is that, with the Russians already having the Vishakhapatnam contract, the tangle may be resolved by splitting the remaining two plants between the Germans and the British

Consolidation

It can, however, hardly be gainsaid that more important than creation of new capacity is consolidation of the existing capacity. Capacity utilisation in the Indian steel industry has generally been poor, largely because of the power and coal constraints. The last two years, 1979-80 and 1980-81, were particularly bad because of the infrastructural crisis triggered by the 1979 drought. Coal and power supply to the steel industry went out of gear and it was only in the second half of last year that the situation began to improve. In 1980-81 ingot steel production in the steel plants was only 5.5 million tonnes against the rated capacity of 9.4 million tonnes and saleable steel production was only 4.7 million tonnes against the rated capacity of 7.2 million tonnes.

The first four months of the current financial year, April-July, have recorded a tremendous improvement. Ingot steel production during these four months went up by 18.6 per cent compared to the corresponding period last year. Similarly saleable steel production increased by 30.7 per cent compared to the corresponding period last year. The plant-wise ingot steel production targets for this April-July period impressively fulfilled are as follows: Bhilai 98.6 per cent, Durgapur 102.9 per cent, Rourkela 81.1 per cent, Bokaro 90.5 per cent, IISCO 97 per cent. However, to put the performance in perspective, it is important to note that, owing to the pessimism induced by the difficulties encountered in the previous two years, the annual targets for the current year have been fixed at levels considerably below the installed capacity. The targets fixed and the installed capacity are as in Table A.

Table A: Capacity and targets

	Capacity	Targets
		('000 tonnes)
Bhilai	2500	2100
Durgapur	1,600	1,000
Rourkela	1,800	1,400
Bokaro	2,500	2,050
Tisco	1,000	660

Low target fixation also means that the performance of the steel plants remains considerably below full capacity utilisation. It is further worth noting that the plants which were completely in the dumps during the last two years have recorded a high percentage improvement whereas those which performed comparatively better in the last two years have recorded virtually no improvement. Whereas Bhilai's performance during the April-July period shows only a 0.8 per cent improvement compared to the corresponding period last year, Rourkela has actually come down by 2.7 per cent. On the other hand, Durgapur and Bokaro have recorded improvement to the tune of 32.3 per cent and 72.2 per cent, respectively. This is understandable. While percentage improvement from a low base is always more impressive, Bhilai and Rourkela have reached a plateau at comparatively higher performance. As for IISCO, its percentage improvement is limited because it remains sick.

Reasons for pick-up

What are the reasons for the pick-up in steel production in the last few months ? A tour of steel plants at Durgapur, Bokaro, Rourkela and Bhilai as well as discussions with their managing directors show that the main reason is the improvement in infrastructural support. There has been some improvement in the supply of power and coal to the steel plants. Another contributory factor seems to have been comparatively less trouble on the labour front during the last four months. The importance of this factor cannot be under-rated if it is recalled that the emergency year of 1976-77, when labour was kept on a tight authoritarian leash, was perhaps the best year of the Indian steel industry. It was pointed out to me, with no doubt ample justification, that the human factor should also be taken into account. It can be extremely frustrating for a worker on the shop floor to face, day-in and day-out, shortage of necessary inputs. In other words, as and when the inputs become available, a worker could be expected to be enthused to relatively greater effort.

Mr K. C. Khanna, chairman of SAIL, with whom I had a discussion after my tour of the steel plants, puts the entire issue in perspective. Says Mr Khanna : "Infrastructural support in the form of power, coal and transport is of course our basic need; but after these basic requirements are met our true test begins. It does not mean that the steel industry does not have its own internal problems and deficiencies. We have to improve our technology, productivity of labour and general efficiency".

Railway transportation

Railway transportation remains a major problem for the steel industry. There are two aspects. Raw materials have to be moved into the steel plants and the finished products have to be moved out. Raw materials are no doubt being moved by the railways but, according to the SAIL authority, the requisite rhythm of movement is lacking, with the result that there are often difficulties in regard to availability of the right input at the right time. In regard to the outward movement of freight in the form of steel products the main bone of contention seems to be jumbo-rakes. The railways appear to find it more economical to provide big jumbo-rakes to the steel plants for movement of steel. But the argument of the steel industry is that the various plants often do not need to move huge quantities in different directions and that what is required is smaller rakes.

Since the railways often fail to provide smaller rakes, the steel industry complains of "restrictive practices" of the railways. A jumbo-rake movement of steel causes distortions in distribution. Furthermore, how to move steel into the interior where the consumer is mostly located ? At present there seems to be no alternative to movement by road transport, which is very expensive. The railways naturally explain their inability to fully meet the requirement of the steel industry in terms of shortage of rolling stock, yard capacity and line capacity. The problem seems to be exacerbated to a certain extent by corruption among different ranks of the railways personnel.

I was told of dozens of instances of wagons becoming available to private parties after the SAIL authorities had elicited a negative reply from the railways. All such stories cannot be untrue. The north-eastern region, which mostly has metre gauge, presents a particularly difficult problem in regard to transportation of steel. In the short-run there is no option to the chairman of

SAIL and the chairman of the Railway Board sitting together periodically to sort things out as best as they can. From the long-term point of view, however, the railways do not seem to be geared to satisfactorily meet the requirements of the steel industry and this lacuna will have to be rectified through appropriate adjustments in investment.

Sales organisation

Up to 1961 different steel plants had their own sales outfit. In 1962 the Central Sales Organisation was formed as a wing of the then Hindustan Steel Limited. SAIL was initially a holding company but on its conversion into an operating company, in 1979 CSO became the Central Marketing Organisation, the change in nomenclature obviously being intended to widen its concept. Since distribution of steel is almost fully controlled, CMO is more a distribution organisation rather than a marketing outfit. Quotas for supply of various steel items are determined right down to the grassroot level through an unwieldy pyramidal apparatus which has at the apex the Steel Priority Committee followed by the Iron and Steel Controller. The quotas are fixed on the basis of data collected and supplied by CMO and the statistical wings of the consuming ministries.

Steel consumers are divided into four groups. Group A includes priority sector consumers like coal, steel, defence, railways, power projects coming under the Central Electricity Authority and irrigation projects coming under the Central Water Commission. Then come the other groups in dwindling order of importance. From 70 to 80 per cent of the steel is consumed by the government sector. The CMO also markets other byproducts of the steel industry like fertilisers and coal-derived chemicals like benzene and toluene.

It is, frankly, not easy to understand the so-called glut in regard to saleable steel against the backdrop of a general excess of demand over supply. Mr S. K. Daspatnaik, general manager, Central Marketing Organisation, whom I met at his headquarters in Calcutta, is clearly a worried man. At the time I met him in the first week of August, he was saddled with 6.58 lakh tonnes of saleable steel, 3.3 lakh tonnes in the stockyards and 2.58 lakh tonnes in the plants. The break-up of steel demand for 1981-82 is shown in Table B :

Table B : Break-up of steel demand (1981-82)

	(Million tonnes)
Bars and rods	4.20
Structurals	1.60
Plates	1.41
Hot-rolled sheets	0.36
Hot-rolled coils and skalp	1.10
Cold-rolled sheets and coils	0.68
Galvanised plain and corrugated sheets	0.21
Steel plates	0.13
Railway material	0.17
Pipes	0.08
Total ..	10.52

Imports of 1.4 million tonnes of steel were planned in 1980-81. About one million tonnes have arrived and the rest is in the pipeline. In addition, imports of another 1.66 million tonnes were planned in the current year. Orders have been firmed up and arrivals have commenced. In the meanwhile production of steel has picked-up. The total availability of steel in April-July was 3.23 million tonnes against 2.47 million tonnes in the corresponding period last year. This comprises 2.19 million tonnes from the integrated steel plants including Tisco, 0.53 million tonnes from mini-steel plants and 0.51 million tonnes imported under back-to-back and buffer schemes (as distinct from OGL). But the offtake of the indigenously produced steel items has fallen because imports under the Open General Licence are cheaper, partly because of lower cost of production of foreign suppliers and partly because of dumping by them.

The Bombay region alone is supposed to have imported about one lakh tonnes of cold rolled sheets. The price of the imported products is about Rs 1,500 per tonne less than the JPC price. Therefore CR sheets are accumulating. Another reason given by the CMO authorities for their accumulation is slump in the automobile, drum barrel and refrigeration industries. Also piling up are bars and rods, with Calcutta, Madras and Bombay ports holding stocks. Other items causing worry include hot rolled coils and skelp. With its improved production, Bokaro produced 65,000 tonnes and Tisco 15,000 tonnes but in the April-July period orders were only to the tune of 36,000 tonnes. Because of accumulation of stocks there are reports of the steel prices tumbling in the open market.

Aberrant situation

What is the remedy for this temporary aberrant situation ? SAIL, according to Mr Khanna, has advised the Government to discontinue OGL imports of steel and also permit, albeit temporarily, exports of certain items whose offtake is proving a problem. The items suggested for export are billets, skelps, cold rolled coils and sheets and large diameter spirally-welded pipes. The Government is considering the SAIL proposal. In fact, there are already reports of some tightening in the form of non-extension of the validity period of licences for import of hot rolled coils by the steel tube industry. It has also been decided not to issue further no-objection certificates for such imports. Another step that has been taken is adjustment in production. For example, Bokaro and Rourkela have been directed to shift from cold to hot rolled products. Recourse to such a measure in the present circumstances may be justified, but it is described as unadvisable on technological grounds. Also, the Steel Ministry has asked SAIL to raise its production of pig iron in order to recoup its losses on account of inadequate offtake of steel. Moreover, there is a shortage of pig iron as SAIL's production target, because of the accent on steel, has not been met. As against the planned production of 500,000 tonnes during the April-July period the actual production has only been around 300,000 tonnes. SAIL is considering an upward revision of its current year's pig iron production target to 14.5 lakh tonnes.

Mr Daspatnaik painted a graphic picture of the difficulties being faced in moving finished steel products on account of inadequate support by the railways. According to him, wagons are either not available or provided only in the form of jumbo-rakes. This, he insists, is an aggravating factor in the present problem of stock accumulation. The present glut does not mean that the country can do without imports in the future. There are various categories of "matching steel" — having particular size, thickness, tolerance and tensile strength — in the area of plates and structurals which are not made in the country and would need to be imported. For example, 0.63 mm gauge cold rolled sheets required for the oil industry have to be imported.

When production lags behind, imports have to be planned, not to speak of the black money that is generated; when production picks up there is a glut. This is no doubt a piquant situation ascribable to some extent to the unwieldy controlled steel distribution system. It would mean that there is a good case to decontrol steel, at least in regard to those consumers which are outside the priority sector. Mr Khanna supports this line of thinking and says that recommendations in this connection have already been made to the Government. There is no doubt that price fixation of steel through market forces would redound to the advantage of consumers, the steel industry as well as the Government.

Steel prices

Price of steel is definitely on the high side, ranging roughly between Rs 3,000 to Rs 6,000 per tonne depending upon the item. The price of steel items is fixed by the Joint Plant Committee on the basis of the average cost of production of all the plants and a 12 per cent return on net worth. The high price is attributable to high cost of production, Steel Development Fund and the huge excise duty.

An amount of Rs 500 upward per tonne is added to the price of steel as a levy which goes into a fund for the development of the steel industry. The usefulness of SDF is debatable. The advantage of creating a fund for development of the steel industry has to be weighed against the correspondingly greater expensiveness of steel, which is an essential infrastructural item. Mr Khanna, as chairman of SAIL, of course thinks that the SDF is a useful measure. However, it may be pointed out that uptil now SDF has been used for reimbursing plants for cost escalation rather than development of the industry. For example, of the expected accrual of Rs 226 crores in 1980-81, Rs 220 crores would go for cost escalation compensation. Little wonder, therefore, that the Government has directed the Bureau of Industrial Costs and Prices to go into the costing of steel industry in order to rationalise the price structure.

If JPC pricing is done with a view to securing a 12 per cent return on net worth the steel industry should show a profit. In 1979-80 SAIL showed a pre-tax profit of Rs 30 crores. Although the report of the Bureau of the Public Enterprises does not give the post-tax figure, SAIL is said to have roughly broken even in 1979-80. The company's financial position for 1980-81 is still under computation. In the current year SAIL ought to do much better because of the improvement in production and the 20 per cent price hike in February. Moreover, the price was further hiked by another Rs 75 per tonne to create a fund for reimbursing steel consumers in the exporting industries for the difference between the imported and indigenous price of steel.

Bhilai: Blaze of molten steel

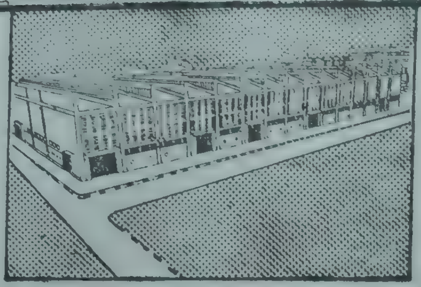
Feather-bedding

High cost of production in the steel industry is partly traceable to the phenomenon that characterises the entire public sector—social burdens. This takes two forms. One, feather-bedding or excess employment, the idea being not only to make steel but also provide jobs. Two, fairly high pay and reasonable good amenities in the form of housing facilities and community services which are available in the townships of all the steel plants. The extent of feather-bedding can be seen from the fact that, according to experts, even in the Indian conditions marked by less mechanisation and lower labour productivity, the work force complement of a one million tonne plant should not exceed 13,000 to 14,000. But in all the plants I visited the work force far exceeds this complement. In the West and Japan the work force complement is 7,500 to 10,000. Barring exceptions warranted on technical grounds, there should be a complete moratorium on further recruitment. Mr Khanna seems to agree with this and says that directives have been sent out to the plants placing curbs on further recruitment. Another major factor responsible for the high per unit cost is the poor capacity utilisation. This is explainable in terms of inadequate infrastructural support, low labour productivity, bureaucratic culture that permeates any government-owned organisation and labour problems. The third major factor accounting for the high cost of production seems to be technology.

In chemical terms conversion of iron into steel means reduction of the carbon element in the metal. There are two main technologies. One is the traditional open hearth technology in which pig iron, scrap, dolomite and limestone are shoved into a furnace fuelled primarily by the coke oven gas. The second, more modern technology is called the LD process, named after two Austrian villages, Linz and Donowit, where it was invented. This method is only different from the open hearth technology inasmuch as the steel-making process is speeded up by blowing or "lancing" oxygen from the top into the furnace. The huge container in which steel is made is, therefore, also sometimes called an oxygen convertor. This technology is 10 times faster than the open hearth furnace and, according to Mr Khanna, yields a 12 per cent more return on investment. Why, then, did India go in the for the open hearth technology? Is it the price the country paid for its nearness to the Russian lobby? The Soviet Union was for a long time using the open hearth technology which it brought to Bhilai and Bokaro.

I put this question to a number of experts at the steel plants as well as Mr Khanna. They insist that it would be wrong to think that India ended up with an outdated technology because of the Russian influence, asserting that in the early fifties, when the steel plants began to come up, the LD process was not yet fully stabilised. Moreover, it was considered wiser to go in for a balance of technology. Thus, while Durgapur (British collaboration), Bhilai and Bokaro put the accent on open hearth furnace, Rourkela went in for the LD process with German collaboration. It may, however, be pointed out that the LD process had begun to be introduced in different parts of the world in the forties. Anyhow, the modernisation and expansion programmes at Durgapur, Bokaro and Bhilai envisage installation of oxygen convertors.

Yet another innovation is oxygen blowing from the bottom instead of the top which further speeds up the steel-making process. It has been introduced in the USA. But Mr Khanna feels that it is too early to think of its application in India. Also under study by the Ministry of Steel and the Mineral Development Board are the three new Swedish iron-making processes—INRED (inten-



A vast complex housing the only completely integrated mini-steel plant in the country.

The best Galvanising Patenting equipment and Techniques at Modi Steels.

Controlled and efficient Rolling to produce quality Forging Steels and Wire Rods.

MODI STEELS

From hairpins to power transmission cables... Modi Steels Wires are everywhere!

Modi Steels produces the most versatile Steel products which include (1) Billets for forgings (2) M.S. Special and Alloy Steel Wire Rods (3) Wires, both Galvanised and Ungalvanised in Mild Steel, High Carbon and Alloy Steels. (4) Tor Steels.

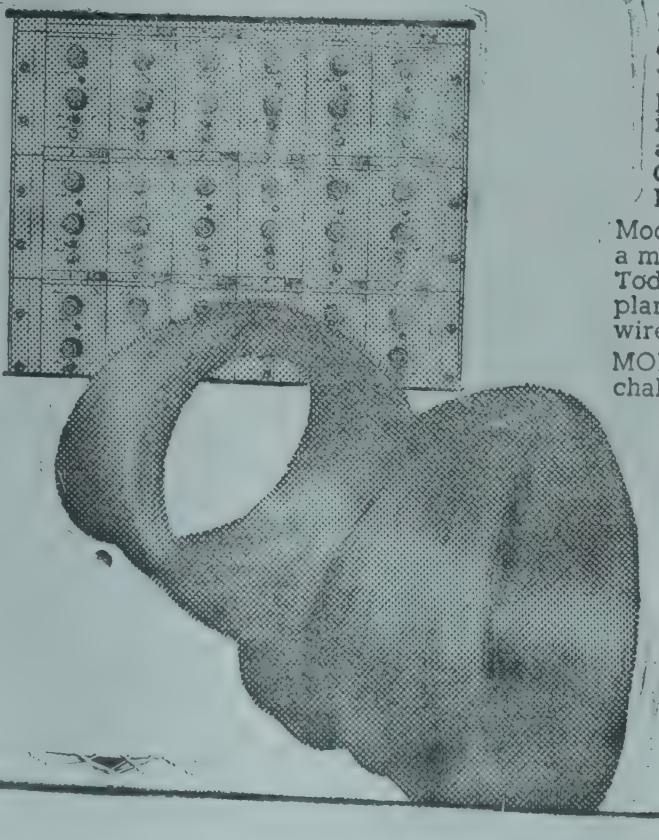
The Industries served by it include :—

1. General Engineering, Wire-netting, nails, barbed wire, telegraph etc.
2. High Tensile Fasteners, Nuts, Bolts, Machine and Socket Screws etc.
3. Construction (high rise structures) for prestressing purposes.
4. Spring manufacture, Rolling shutters, Umbrellas, Conductor manufacturers-in Electrification for Electricity Boards, etc.
5. Textiles.
6. PVC Cables, Telephone Cables.
7. Forgings for automobiles, tractors, machinery, machine tools, trucks, heavy engineering etc.

It has now embarked upon an ambitious expansion programme in collaboration with Daido Steel Co. of Japan. Under this programme it aims at providing 100% import substitution in the field of Special and Alloy Steels, with special reference to Cold Heading Quality Wires and Wire Rods.

Modi Steels was started in the year 1963 with a modest capacity of 2000 tonnes a year. Today, it has grown into a giant mini-steel plant with a capacity of 80,000 tonnes of wires and rolled products..

MODI STEELS is thus, geared to meet all the challenges of the EIGHTIES.



MODI STEELS

Daido Steel Co. Ltd. of Japan)

INT/MS/3—80

sive reduction), ELRED (electric reduction) and Plasma Smelt—which are claimed to ensure viability at smaller plant sizes and are said to be 20 per cent cheaper than the conventional blast furnace. *MECON*, which has been studying these processes on behalf of *SAIL*, thinks that these are still at the developmental stage and require further testing before they could be incorporated in a complete steel plant. Continuous casting is another technological innovation on the anvil and is to be introduced gradually. The idea is to eliminate the stage of making solidified steel ingots and straightway cast liquid steel into the requisite mould.

TISCO's performance

Why does *TISCO* perform better than the public sector steel plants? This is a question of hardheaded comparison which brooks no sentimentality. For the last seven years the company has shown 100 per cent capacity utilisation, and even in the difficult 1980-81 it was 101 per cent. With little over 17 per cent of the installed capacity for saleable steel in the country, *TISCO* contributed 25 per cent of the production last year. I put this question to the public sector steel men throughout my tour and came across various explanations and arguments. The most repetitive ones may be enumerated here. One, *TISCO* has the advantage of captive power generation and is, therefore, not subject to the vagaries of power supply. Two, *TISCO* has a larger number of smaller rolling mills which gives it greater flexibility of operation in the face of power fluctuations. Three, *TISCO* has the advantage of coking coal captive mines. Four, most of *TISCO* products are non-JPC items which enable it to profit from free market pricing.

The reaction of an impartial observer to these arguments would perhaps be as follows: (1) With a two million capacity, *TISCO* has 70 megawatts of captive power generation. The public sector plants also have captive power generation whose ratio to the installed capacity is roughly comparable to that of *TISCO*. The Tatas however have the advantage that as and when the need arises they can shut *TELCO* and divert power supply to *TISCO*. (2) The large number of smaller rolling mills—13 in all—no doubt gives *TISCO* great flexibility in adjusting its operation to power supply. On the other hand, the rolling mills in the public sector units are bigger, so that either a mill runs fully or not at all, Ironically, this is the price *SAIL* has to pay for modernity. (3) As for coking coal, *TISCO* is no doubt well-placed in terms of captive mines. But some *SAIL* plants also have captive mines and those which do not have collieries within reachable distance. Some say that the Tatas have shown foresight in paying attention to the improvement of their washeries, so that *TISCO* has a comparatively lesser problem of ash content. (4) The argument about non-JPC items is substantially justified. Over 55 per cent of *TISCO's* product mix is decontrolled items.

In the ultimate analysis, however, it is difficult to resist the impression that the better performance of *TISCO* can only be fully explained in terms of the superior efficiency of private enterprise. *TISCO's* captive power plant often works at more than full capacity. Although *TISCO* owns 6 per cent of the country's coking coal reserves, its contributes 12.5 per cent of the total production. It must also be remembered that *TISCO* has been doing better despite its outdated technology. It has open hearth technology and also the still more outdated process called Bessemer. The company has now embarked on a modernisation programme which is to be completed in January 1983 at a cost of Rs 210 crores. Of this, about Rs 55 crores have been raised as loans abroad.

Power for SAIL

As mentioned earlier, power and coking coal problems will have to be tackled if the steel industry is to progress. Because of the undependability of power supply *SAIL* is being compelled to raise its captive power generation capacity by another 540 megawatts. This, as Mr Khanna points out, will increase the capital cost of steel production. The coking coal problem pertains to the high ash content in it. Indian coking coal has 25 per cent to 28 per cent ash content. But Japan, for instance, uses coking coal with only 10 per cent ash content. A high ash content creates havoc first in the coke oven and then in the blast furnace. The quantity of impurities increases and the coke oven gas produced is correspondingly less. Mr Khanna thinks that one per cent reduction in ash content can make a difference of 13 to 14 per cent in production. While this may be overstating the point, it shows the importance the *SAIL* boss attaches to this problem. With imported coking coal costing Rs 1,250 a tonne, indefinite and unlimited imports is no lasting solution. It seems there is no option to improving washeries and washery technology in the country. In the meanwhile two improvisations are being practised. Blending is being done using 20 per cent non-coking coal in the blast furnace. Secondly, non-coking coal is being pre-heated before being charged into the coke oven. A major aspect of the R and D work at Ranchi attempts to reduce the coke rate in blast furnace through improvement in the blast furnace technology by adopting beneficiation of ores, lime dust injection, coal dust injection and sintering of iron ore. Research is also being done on developing alternative routes to steel production eliminating coking coal.

Since the coke oven gas is the fuel that is burnt in a steel plant, coke oven is the initial and most sensitive stage in the process of steel production. Maintenance of coke ovens in steel plants is, therefore, of vital importance, a lesson that should have been learnt from the crisis of 1970-71. Repair and maintenance of coke ovens requires attention in a cyclical fashion and there is constant vigilance, according to Mr Khanna. As coke oven is the sensitive spot in a steel plant, it is also most vulnerable to labour action. Conversations at various places showed that the authorities fear strikes in the coke oven section. Recently Bokaro's production was completely dislocated because of a strike in coke ovens in June.

Durgapur

The Durgapur steel plant was set up in collaboration with the British Steel Corporation. Originally designed for one million tonne capacity, the plant was expanded to 1.6 million tonnes in 1969. It is based on the open hearth steelmaking technology, having eight furnaces of 220 tonne capacity and one of 120 tonne capacity.

Situated on the northern bank of river Damodar, Durgapur is on the Calcutta-Delhi main railway line and the Grand Trunk Road. The Jharia coalfields and the adjoining Raniganj and Barakar collieries, which together constitute the main source of coking coal in the country, are about 100 kilometres from the plant. Sources of iron ore, limestone and dolomite are, however, not as near. Iron ore comes from Bolani (320 kilometres), limestone from Birmitrapur and Satna (360 and 850 kilometres, respectively) and dolomite from Barduar (582 kilometres). Durgapur provides employment to 33,000 people. This means that for a plant of 1.6 million tonnes there is feather-bedding to the extent of over 7,500. The township, spread over 30 square kilometres, consists of 21,000 residential units and provides reasonably good amenities for health, education and recreation.

As can be seen from Table 1, capacity utilisation at Durgapur has generally been poor. The best year for the plant was 1976-77, when it produced 1.1 million tonnes of ingot steel and 900,000 tonnes of saleable steel. Last year the ingot steel and saleable steel production was one million tonnes and 780,000 tonnes, respectively. The April-

Table 1: Durgapur's capacity utilisation for last 10 years

Year	Ingot steel	saleable steel
1970-71	39.6%	33.3 %
1971-72	43.7%	34.9 %
1972-73	45.1%	38.5 %
1973-74	48.5%	30.4 %
1974-75	51.2%	42.0 %
1975-76	62.5%	60.6 %
1976-77	68.2%	72.7 %
1977-78	68.2%	69.8 %
1978-79	59.1%	62.75%
1979-80	55.5%	48.8 %

July period this year shows an improvement, the targets for both ingot and saleable steel having been fully met.

Power supply is a constant source of worry, says Mr D. Mukerjee, managing director. Durgapur's requirement is 60 mva (mega volt ampere). Of this, 50 mva are supposed to come from the Damodar Valley Corporation and 10 mva from a captive thermal unit. Last year the plant got only 55 per cent of its requirement. This year, despite the improvement, supply remains erratic, as can be seen from the percentages of the actual supply in relation to the indented demand: April 79 per cent, May 74 per cent, June 42 per cent and July 60 per cent. In order to move towards power self-sufficiency two captive thermal units, having a total generating capacity of 60 megawatt, are being built with Polish assistance. One unit will be ready in September 1982 and the other in early 1983. Sometimes power supply for the township, which comes from the Durgapur Projects Limited, a thermal station run by the West Bengal Government, has to be diverted to the plant to ease the power shortage in it.

Although there has been an improvement in the April-July period, the plant's position in regard to availability of coal, iron ore, limestone and dolomite has generally been uncomfortable. Durgapur's daily coal requirement ranges between 4,000 to 7,000 tonnes. It has been getting, on an average, about 66 per cent of this quantity. Iron ore supply has often been affected by non-availability of railway wagons. Even after the recent improvement the shortfall remains 25 to 30 per cent. Limestone and dolomite supply has improved. In 1980-81 the planned requirements and actual supply were as follows:

('000 tonnes)

	Plan	Actual	
Coal	2,774	1,869	67%
Iron ore	1,764	1,014	57%
Limestone	612	369	60%
Dolomite	225	73	32%

Mr Mukerjee is worried about the problem of high ash content in coking coal. The ash content in the coal Durgapur gets is about 28 per cent and they would happy if it could be reduced to 25 per cent. A high ash content means additional unproductive elements in the blast furnace. Because of the superior coking coal available to it, Japan uses only 500 kilograms of coking coal to make one tonne of steel compared to 900 to 1000 kilograms in India.

Durgapur has a modernisation-cum-expansion programme which would take the plant's capacity to two million tonnes. The consultancy remains with the British Steel Corporation. The programme, estimated to cost over Rs 1,000 crores, is included in the Sixth Plan. It is, however, running behind schedule. The oxygen-blowing LD steel-making process is to be introduced with the installation of two convertors. Continuous casting is also to be introduced. Other prominent features of the programme include addition of one blast furnace to the existing four and installation of one more coke oven battery.

A major function of Durgapur is to manufacture wheels and axles for the railways. Low or negative profit margins on supplies to the railways, along with poor capacity utilisation, explain the losses incurred by the plant. Whereas the cost of production of a wheel set works out to Rs 6,600, Durgapur gets only Rs 4,700 from the railways. On sleepers the plant has been losing Rs 300 per unit. The post-tax losses notched up by the plant are as follows : 1975-76 Rs 20 crores, 1976-77 Rs 7.7 crores. 1977-78 Rs 17.5 crores. 1978-79 Rs 4 crores (profit). 1979-80 Rs 22 crores and 1980-81 Rs 8 crores.

Situated as it is in West Bengal, Durgapur is regarded as a difficult place from the point of view of industrial peace. Despite my repeated requests, the authorities, on one pretext or the other, did not give me an opportunity to meet a workers' representative. Although there are a number of unions, the management deals mainly with the Marxist-oriented CITU-led union which, in a state ruled by a Marxist government, is only diplomatic. The last four months, I was told, have been quiet, barring some minor trouble in the blast furnace. Table 2 gives the loss of manhours as well as the production loss in Durgapur on account of labour trouble.

It was the wheel and axle shop which made the most outstanding impression during a visit to the plant. A red hot steel ingot has to go through 13 processes of compression and smoothening before it becomes a railway wheel. The markings on the machines show that these were supplied by a consortium of British companies. Another lasting impression is the stringent check at the gates, whether it be a worker or officer, to prevent theft of materials. The boots of cars and scooters are invariably opened by the security men. It may look demeaning, but there seems to be no other way out.

Table 2: Durgapur industrial relations

Year	Loss of Manhours '000	Production of ingot steel '000 tonnes
1970-71	1,760	634
1971-72	825	700
1972-73	140	703
1973-74	231	776
1974-75	117	819
1975-76	2	1,001
1976-77	Nil	1,091
1977-78	14	1,092
1978-79	72	946
1979-80	167	882
1980-81	499	741

Alloy Steel Plant—Durgapur

As its name suggests, this plant produces special alloy steels, its customers including Ministry of Defence, automobile industry, *TELCO*, forging industry and *BHEL*. With a capacity of 60,000 tonnes of saleable steel, the plant also has competitors like the public sector VISL at Bhadravati, Mahindra Ugine (Musco), Birla-owned Bihar Alloy and Guest Keen Williams. Mr M. C. Tarafdar, acting executive director, frankly admits that his main problem is a higher cost of production because of higher costs, which is a euphemism for feather-bedding.

Alloy Steels is a power-intensive plant, requiring 50 mva but getting on an average 35 mva. Last year DVC imposed "restrictions" for 95 per cent of the time, when the supply was not even 35 mva. In the first quarter of the current year the DVC supply has improved, the restrictions having come down to 63.7 per cent. As a result, production has improved. In April-July the plant produced 21,552 tonnes of ingot and 10,156 tonnes of saleable steel as against 12,307 tonnes of ingot and 6,273 tonnes of saleable steel in the corresponding period of 1980-81. Capacity utilisation has been better than the adjoining integrated plant but, as can be seen from Table 3, shows a downward trend. After

Table 3: Alloy Steel Plant's capacity utilisation

	1975-76	1976-77	1977-78	1978-79	1979-80	1980-81
Ingot steel	90.3%	94.8%	97.2%	97.3%	76.7%	70.4%
Saleable steel	78.2%	86.4%	81.4%	81.4%	76.1%	69.5%

1974-75 and barring 1979-80 the plant has been making profit as follows: 1975-76 Rs 4 crores, 1976-77 Rs 4.17 crores, 1977-78 Rs 2.14 crores, 1978-79 Rs 2.02 crores, 1979-80 Rs 7 crores (loss). Table 4 shows the man-hour losses on account of labour trouble. Here also the management, for obvious reasons, recognises the CITU-led union.

Alloy Steels has a two-stage expansion programme. Under the first stage a 50 tonne capacity electric arc furnace has been installed and is scheduled to be commissioned in September. This would increase the plant's power requirement by 25 mva but DVC, according to the managing director, Mr Tarafdar, has indicated its inability to meet the additional need before October. Will the new furnace remain idle during this interrugnum? This should give some insight into the problems faced by the steel industry on account of inadequate power and the resultant under-utilisation of capacity. Anyhow, under the first stage expansion the ingot and saleable steel capacity of the plant will increase by 600,000 tonnes and 400,000 tonnes, respectively. The additional production will also meet *BHEL's* requirement of blooms for making boiler tubes which are at present being imported. Under the second stage, which is to be completed in 42 months with effect from August, a vacuum technology, involving secondary refining in ladle, is to be introduced, probably in collaboration with Standard Meso of West Germany. In this plant also the innovative continuous casting technology is to be introduced. The second stage will add another 100,000 tonnes to the plant's capacity.

How will the expanded Durgapur alloy unit co-ordinate with the newly completed alloy unit at Salem? Salem has facility only for cold rolling of stainless steel, which means that for some time it will have to depend on import of hot rolled coils. The idea is that eventually Alloy Steel should supply stainless steel slabs to Bokaro, which would roll these into stainless HR coils for supply to Salem.

Table 4: Alloy Steel Plant: Man-hour loss

	Direct	Indirect
1977-78	3,582	431
1978-79	44,844	1,11,256
1979-80	60,652	64,793
1980-81	89,200	1,009

The technical know-how for Alloy Steel came from Atlas of Canada and the machinery was provided by the Japanese. A visit to the plant showed that now some Italian machinery is beginning to be inducted. Three other impressions remain. A 2000 tonne press had just been renovated entirely with Indian expertise. A rolling unit was idle, showing an imbalance between ingot-making and rolling capacities which is now planned to be rectified. In a bar mill a red hot steel bar was being shifted on the rollers by a worker holding an iron rod. God forbid, one slip and a fall on the bar and the worker would be scalded beyonded recognition, if he were to live. Such manual handling is indicative of technological primitiveness and should be stopped forthwith.

Bokaro

The Bokaro steel plant has for the current year the challenging production target of 2.05 million tonnes of ingot steel and 1.6 million tonnes of saleable steel, which represents an increase of 122 per cent and 90 per cent over the last year's production of 0.92 million ingot steel and 0.84 million saleable steel. Because of severe power and coal constraints, last year was a particularly difficult one, with capacity utilisation for ingot and saleable steel falling to 39 per cent and 62 per cent, respectively. Of Bokaro's requirement of 225 mva, 62 megawatt is firm power available from the captive station and 145 mva are contracted for supply by *DVC*. Last year *DVC* imposed restrictions ranging between 5 and 116 mva for a duration of 7,428 hours, and for most of this period restrictions were below 50 mva.

Barring June, when there was serious dislocation of production because of labour trouble in coke ovens, there has been considerable improvement in the first quarter of the current year (See Table 5). But the power supply, though improved, remains erratic. For example, on July 12, 13 and 14 various mills of the plant had to remain shut on account of *DVC* restrictions to 29 mva. Table 6 shows the production loss suffered by Bokaro in 1980-81 and April-July 1981-82 on account of power shortage.

The blooming mill at the Durgapur steel plant

But it is raw materials which is proving a real headache for Mr D. R. Ahuja, managing director. The stocks of coal are comfortable, but the quality of raw materials supplied is poor and erratic. Against a norm of 18.5 per cent the ash content is 21 per cent. Regarding other raw materials, even the stocks are inadequate. Mr Ahuja points. that against a norm of 15 day's stocks he had (on August 9) stocks as follows: iron ore six days, limestone one day and

Table 6: Bokaro—Production loss

Year	Reason	Ingot Steel T	Saleable Steel T
1980-81	Power	80,880	3,19,308
April-July 1981	Power	—	12,967

Table 5: Bokaro—Production targets/Achieved

	1980-81		1981-82							
			April		May		June		July	
	Target	Achieved	Target	Achieved	Target	Achieved	Target	Achieved	Target	Achieved
Ingot Steel	18,20,000	9,22,546	1,50,000	1,45,047	1,55,000	1,56,021	1,60,000	1,13,725	1,65,000	1,55,539

In a world of constant changes...
Trust TORSTEEL®
to give you
quality
that never changes.

orsteel? What's Torsteel?

orsteel is a highly efficient yet economical
ubstitute for mild steel. Rolled to an exclusive
nternational design in association with the
orsteel Research Foundation in India.
nd guaranteed by the manufacturers to be the
est money can buy.

nlike mild steel, Torsteel quality ever varies

orsteel is better than mild steel—any way
ou look at it. Consider its consistent quality:
very bar of Torsteel is identical to the millions
bars that have been produced earlier. As well
to the millions yet to be manufactured.

Plus all these other features as well

In addition, Torsteel gives you 100% higher bond strength, as well as 65% greater yield, than mild steel. Thus saving you about Rs 2400/- for every tonne of Torsteel you buy. That's not all. Torsteel offers you ☐ 20% extra safety due to hyper resistance ☐ Less crack width ☐ Satisfactory bendability, weldability and fatigue strength.

A range to suit every requirement

Torsteel comes in two internationally acclaimed grades: Grade 40 and Grade 50. Each ranging in size from 8 mm to 50 mm. But first, before paying, make sure it really is Torsteel.

Not an imitation. Insist on a cash memo/invoice/test certificate that says TORSTEEL.

For consistency in quality, look for the letters TOR® on every metre of Torsteel.

dolomite 15 days. The main problem is tardy movement by the railways. Table 7 shows that even during the last quarter, when production is supposed to have picked up substantially, Bokaro never got the requisite supply in regard to any raw material.

Bokaro is a growing plant. At the first stage its capacity was 1.6 million tonnes which has now been raised to 2.5 million tonnes and will eventually touch four million tonnes at the end of the Sixth Plan. Mr Ahuja emphasises that at present there is a slight imbalance as between the ingot and saleable steel capacities. Against an ingot capacity of 2.5 million tonnes the saleable steel capacity should be 1.95 million tonnes, but Bokaro's is only 1.35 million tonnes. Now two groups of soaking pits are ready for commissioning which would take the capacity to the requisite 1.95 million tonnes. The managing director is, therefore, at pains to point out that Bokaro's saleable steel capacity for 1981-82 works out to only 1.70 million tonnes.

The blowing-in of the fourth blast furnace on May 27 heralded the beginning of work on the four million tonne stage. On July 29 the fifth coke oven battery was commissioned. Efforts are being made to prevent any further slippage in the schedule, which is as follows: 3 x 60 mw captive power plant by the end of 1982, steel melting shop-II by September 1982 and cold rolling mill-II by September 1983. The main reason given for the delay is the grant of supply contract to indigenous manufacturers. Bokaro is claimed to be some kind of a swadeshi plant. As much as 60 per cent equipment, 94 per cent structurals and 61 per cent refractories were procured indigenously during the first stage, whereas the corresponding figures for the expansion stage are 88 per cent, 100 per cent and 100 per cent, respectively. For various reasons, Hindustan Steelworks Construction Limited is also going behind schedule in regard to the civil works.

Nonetheless, Bokaro retains all the trappings of the Russian presence. Although there are convertors based on oxygen lancing, open hearth technology is very much in evidence. The additional 300 tonne convertors to be installed will of course be based on the oxygen lancing or LD process, which the Russians have also imbibed. On the day I was in Bokaro there was a visit by the Russian Charge d'Affaires. The number of Russian technicians is placed at 166. Bokaro, however, will not have continuous casting planned to be introduced in other plants.

Barring the emergency year of 1976-77, when it made a net profit of Rs 2 crores, Bokaro has been net loss-maker as follows : 1977-78 Rs 5 crores, 1978-79 Rs 37 crores, 1979-80 Rs 34 crores and 1980-81 Rs 20 crores. Apart from under-utilisation of capacity, an important reason, according to Mr Ahuja, is the high depreciation because of comparative newness of the plant. To this may be added the high overhead and labour costs. Bokaro gives employment to 44,000 people. The plant also has a multiplicity of labour unions. Recognition is given, as elsewhere, to the union toeing the political lines of the state government. Since Bihar is ruled by Congress (I), INTUC is the recognised union. Table 8 gives a picture of industrial relations at the plant.

During a visit to the plant I found the engineer supervising a huge blast furnace also knew Russian, having been trained in the USSR. The equipment was both Russian and Indian, the indigenous markings belonging mostly to *HEC*, *BHEL* and Jessop. One convertor was down, for relining of its walls with refractory fire bricks, which are sometimes imported. Pouring of hot metal (molten iron) from a crane-operated huge ladle into the convertor provided an awesome, synging sight. You cannot look at the blazing scene for more than a minute without hurting your eyes. Conversion of iron into steel means reduction of the carbon content in the metal. The process is speeded up through blowing of oxygen into the convertor from pipes coming in from the top. The hot strip rolling mill was idle, not being fed by the other mills and showing the same type of imbalance noticed earlier during the tour.

Rourkela

Set up with German collaboration in 1958, Rourkela was the first plant in the country to go in for the LD steel-making process involving oxygen lancing. It has been among the better performers and a net profit-maker, as can be seen

Table 8 : Bokaro—Industrial relations

Year	Manhours lost	Production Loss in Ingot steel	Production Loss in Saleable steel

from Table 9 giving capacity utilisation and Table 10 showing the financial results. But, ironically, Rourkela is the only plant where ingot steel production in the last quarter has come down (by 2.7 per cent) compared to the corresponding quarter of the previous year. However, Dr N. S. Datar, managing director, is not unduly perturbed about this describing it as a minor fluctuation after the establishment of a fairly high performance plateau. Nonetheless, complacency would be unwarranted for Rourkela's ingot steel capacity utilisation last year at 64.7 per cent was not exactly brilliant. Anyhow, saleable steel production in the last quarter shows an impressive 32 per cent improvement compared to the corresponding quarter in 1980-81.

Dr Datar faces the same problems as his counterparts in regard to availability of power, coal and railway transport. Rourkela's normal power requirement is 70 to 75 megawatt. Power supply to the plant is subject to fluctuations, especially in the summer months, because the Orissa State Electricity Board grid generation is predominantly hydel with only one thermal station at Talcher. Tables 11 and 12 show the position in regard to power supply to the plant in the earlier years as well as in April-July 1981. Tables 13 gives the position in regard to wagon supply. Tables 14 and 15 give the position about coal supply in April-July 1981 and the earlier years, respectively.

The plant does not have much problem in regard to other raw materials. Captive mines at Barsua, having ore beneficiation facilities, and high grade ore mines at Kalta meet the bulk of the iron ore requirement. Limestone comes from Purnapani and Satna. Dolomite is obtained from the quarry at Baraduar.

Since Rourkela was the only plant which started in a full-fledged manner with the oxygen blowing process, it had to have an oxygen plant which would also yield nitrogen as a by-product. Therefore, Rourkela is the only steel plant having a full-scale fertiliser unit attached to it which produces calcium ammonium nitrate (CAN). But one of the two ammonia units of the fertiliser plant has been getting naptha from outside, presumably because of shortage of hydrogen available from the coke oven gas. To this extent the fertiliser unit has lost the advantage that should normally accrue to it as an appendage of the steel plant. Its capacity utilisation is poor.

Some of the other noteworthy points made by Dr Datar are as follows :

1) Because of accumulation of stocks, Rourkela has been asked to curtail its production of cold rolled

Table 13: Rourkela—Wagon supply

(Average/day)

	KC	CV	CRT	BKC	BOX	BCX	BFT	BOI

The 2,000 tonne press at the Alloy Steel Plant, Durgapur.

by 50 per cent and switch to hot rolled products.

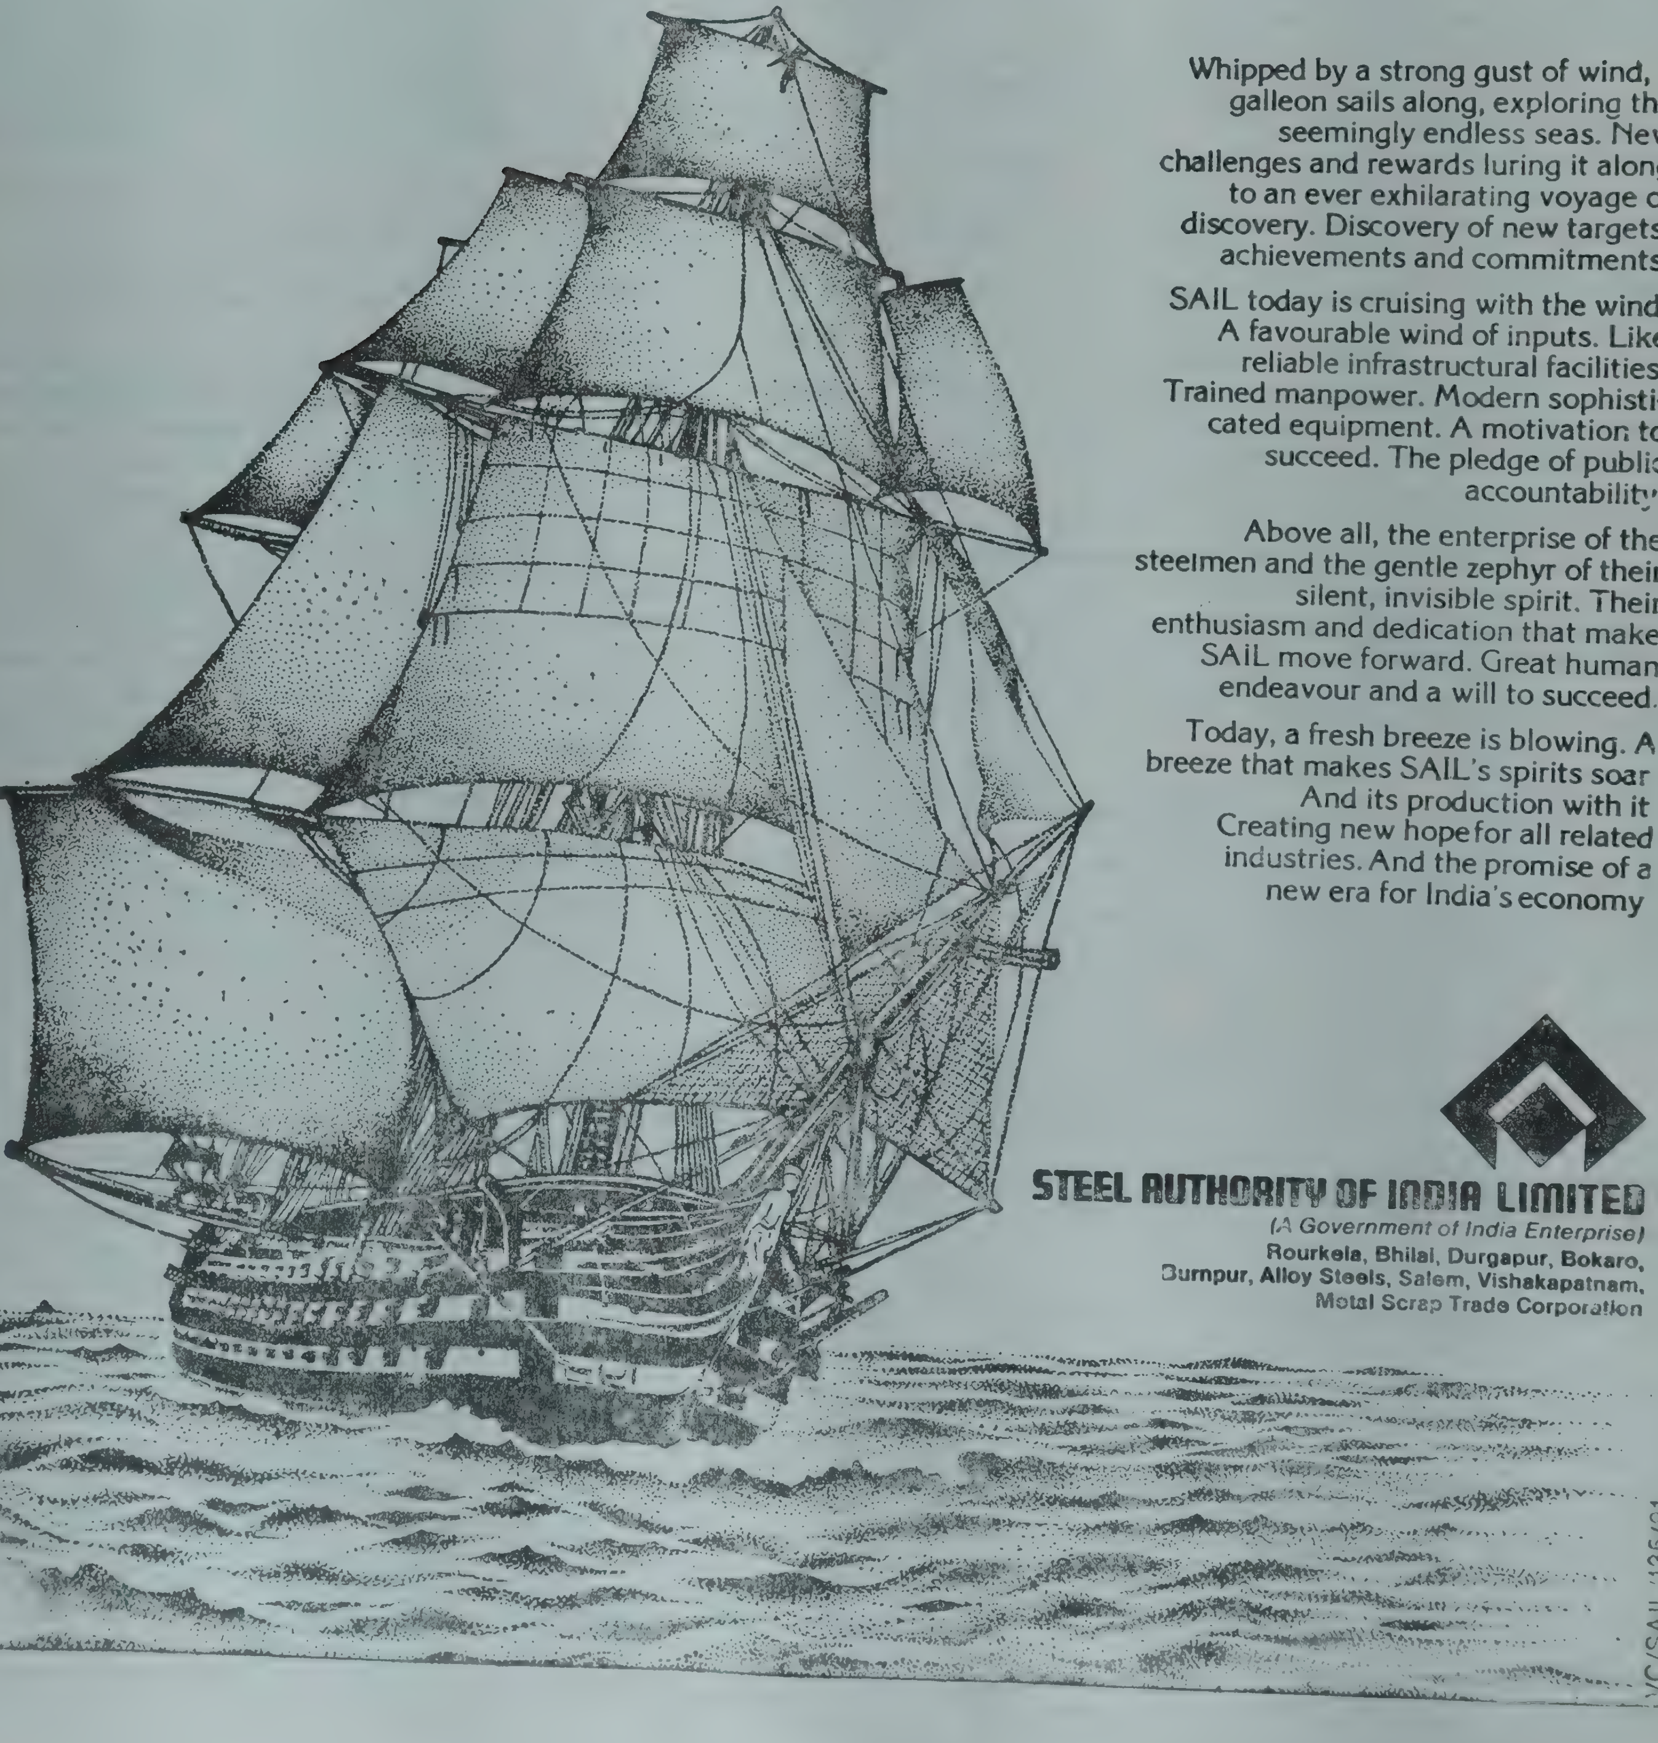
2) Apart from the shortage of wagons, Rourkela also faces the problem created by the insistence of the railways on providing jumbo-rakes.

3) Labour in Rourkela may not be as troublesome as in the West Bengal-Bihar belt but Dr Datar has his share of problems, as should be evident from Table 16. Hind Mazdoor Sabha is the recognised union but there are eight others. "Because of inter-union rivalry, much of my time is taken up in listening to all of them", says the managing director.

4) In order to utilise the granulated slag available at Rourkela and the granulated slag expected to become available at Bhilai on completion of expansion of their blast furnace capacity *SAIL* has decided to set up a cement plant at Rourkela which will have a capacity of 1.89 million tonnes and cost Rs 120 crores. Tenders will soon be floated and after that the plant will take 48 months to complete, which means that it will spill beyond the Sixth Plan. An idea of cost escalation and, therefore, the harmful effect of delays can be had from the fact the Sixth Plan mentions a figure of only Rs 50 crores for the plant. A clinkerisation unit to be located near the limestone deposits at Chilhati in Madhya Pradesh will feed the cement plant.

5) The situation at the coke ovens is a constant source of worry. Rourkela had a strike in this sensitive area in the last week of June. Communist unions are becoming strong in the ovens. A programme to rebuild the coke ovens has been undertaken. By the end of October 35 of the 290 ovens would be rebuilt.

It is not the lofty SAIL but the unseen winds... ...which move the ship



Whipped by a strong gust of wind, a galleon sails along, exploring the seemingly endless seas. New challenges and rewards luring it along to an ever exhilarating voyage of discovery. Discovery of new targets, achievements and commitments.

SAIL today is cruising with the wind. A favourable wind of inputs. Like reliable infrastructural facilities. Trained manpower. Modern sophisticated equipment. A motivation to succeed. The pledge of public accountability.

Above all, the enterprise of the steelmen and the gentle zephyr of their silent, invisible spirit. Their enthusiasm and dedication that make SAIL move forward. Great human endeavour and a will to succeed.

Today, a fresh breeze is blowing. A breeze that makes SAIL's spirits soar And its production with it Creating new hope for all related industries. And the promise of a new era for India's economy

Metal Scrap Trade Corporation

VC/SAIL/135/81

6) Rourkela has perhaps the most impressive record of safety among all the steel plants and has won the National Safety Award several times.

An important expansion programme at Rourkela pertains to the silican steel project which will produce 37,500 tonnes of cold rolled grain-oriented steel and 36,000 tonnes of cold rolled non-oriented steel. Silican is a superior type of steel which is different from the average quality because it has only 3.5 per cent carbon. The consultants for the project are *ARMCO,* an American company which is supposed to be a leader in silican steel technology. Estimated to cost Rs 110 crores, the project has already been much delayed. The silican unit was supposed to have trial runs at the beginning of this year but now it is doubtful whether that can be done even by the middle of 1982. The main reason for the delays is too much of sub-contracting for the project, partly because of indecisiveness in planning and partly because of exertion of pressures by different lobbies in New Delhi. Initially the idea was to give the construction contract to Demag of Germany which, along with Krupp, had built the Rourkela plant. Mid-stream, after the passage of some months, it was decided, under pressure from *DGTD,* that the work should be assigned to Indian companies who could do the job. But, surprisingly, the main parts of the contract were given to *EPI* and *MECON*, both of which are consultancy organisation and have no wherewithal to themselves undertake construction. As a result, they have had to in turn give contracts and sub-contracts down the line, resulting in a multiplicity of parties involved in the job. In view of the increasing sophistication of technology no one company can, admittedly, nowadays do an entire job. But this silican project is an example of excessive multiplication, which means delay. At least this is the impression gained by me on talking to engineers at the construction site of the project.

Bhilai

Bhilai demonstrates the point made earlier, about low target fixation. In the first quarter of this year production of saleable steel at 534,000 tonnes exceeded the target of 525,000 tonnes and yet it represented a fall of one per cent compared to the production of 540,000 tonnes in the corresponding period of 1980-81. Mr N. K. Mitra, managing director, says that during the last few months coal (last year coal supply was erratic and inadequate), and other raw materials have not been a problem but the supply of power remains inadequate. With a captive power plant of only 36 megawatt, this biggest steel plant of SAIL is dependent for power supply on the Korba thermal station.

Comparatively speaking, Bhilai has a fairly distinguished record in capacity utilisation, which largely explains why it is also a net profit-maker. Table 17 and 18 give an idea of the shortage of power supply in 1980-81 and April-July 1981. Table 19 shows the net profit made by the plant. Table 20 gives the position regarding capacity utilisation, production, coking coal and production loss on account of industrial relations. Table 21 gives a detailed picture of the inadequacp of wagon supply.

Table 17: Bhilai—Loss of production due to powerrestriction during 1980-81

Units affected	Stoppages (Hrs. Mts.)	Loss of production (Tonnes)
Sinter: SP—I	570-40	33,520
SP—II	1,135-05	79,325

Table 19: Bhilai net profit

Year	(Rs in lakhs)
1976-77	4.905
1977-78	4.035
1978-79	4.996
1979-80	3.953
1980-81 (provisional)	1.801

Bhilai has an expansion programme under which it will acquire the LD or oxygen convertor technology, continuous casting technology and a white plate mill. The work, started three years ago, was supposed to have been completed at the end of this year. But here also delays have occurred. The white plate mill will now start in the middle of 1982 and the convertor and continuous casting towards the end of 1982, the former getting slabs from Bokaro for rolling till the expansion programme is fully completed.

Some other points made by Mr Mitra include :

1) The recognised labour union is that of *INTUC*, which means it is again a union whose political complexion is the same as that of the State Government (Madhya Pradesh is ruled by Congress (I)).

2) Coke ovens are being attended to. A battery of 65 ovens has been rebuilt. Some labour trouble, however, is there, mostly from leftist unions.

3) The managing director does not agree that excessive sub-contracting is a reason for the delay in implementation of the expansion programme.

4) Rails and structurals have been the main products of Bhilai, the former being sold to the railways at 20 per cent less than the cost of production. Attention will also now be paid to high quality steel and product development.

A tour of the Bhilai plant left the following lasting impressions :

Table 20 : Bhilai's capacity utilisation and loss of man-hours

(Unit : '000 tonnes)

Particulars	1976-77			1977-78			1978-79			1979-80			1980-81			1981-82

	Requirement	Receipts	%	Requirement	Receipts	%	Requirement	Receipts	%	Requirement	Receipts	%	Requirement	Receipts	%	Requirement	Receipts	%
Coking coal	3,746	4,007	107.0	4,006	3,995	99.7	4,006	3,752	93.7	4,000	3,577	89.4	3,914	3,516	89.8	1,621	1,273	78.5

Loss of production due to industrial relation problem (in tonnes)

	1976-77	1977-78	1978-79	1979-80	1980-81	1981-82 (April-July)
Ingot Steel	Nil	3,600	34,741	6,212	1,374	27,420
Saleable Steel	Nil	21,380	19,383	23,210	23,820	24,500

1) The Russians are very much in evidence.

2) The machinery and equipment for the expansion programme is being supplied by the Heavy Engineering Corporation, *BHEL, MAMC,* Braithwaite and Jessop. The huge Russian-built "roughing stand" in the plate mill is a truly awesome sight. The railways had to build special wagons to transport it from Visakhapatnam. Apart from Russians, the consultancy is with *MECON, EPI* and Instrumentation Limited. Excessive sub-contracting is again in evidence. Because of the delays, the cost of the expansion programme has now been revised to Rs 1,460 crores. The civil construction work is with the trouble-racked Hindustan Steelworks Construction Limited. But I am told that the company's new boss, Mr Shambu Kumar, is a tough, no-nonsense executive.

3) Excessive smoke from the chimneys shows that the gas cleaner is not working. But I am told that the township is so located in relation to the general direction of the wind that the smoke is blown away from it.

4) Since the demand of rails by the railways is down, the rails shop is working only at half of its 500,000 tonne capacity.

5) The wire rod mill is not working because there is no gas for the soaking pits. And there is no gas for the soaking pits because one blast furnace is under repair. (Mr Mitra later agreed that this showed managerial deficiency).

6) In the steel melting shop dolomite is being shovelled into the furnace to line the walls.

7) In the blooming mill it is difficult to look at the red hot ingots whose temperature is 1300 degrees centigrade

8) Bhilai has 60,000 employees, showing a high degree of feather-bedding.

Incidentally, Mr Mitra has just taken over as managing director from Mr E.R.C. Sekhar, who has left to join the Birla-managed consortium called Pan African, which has bagged a huge contract to build a 5.2 million tonne steel plant in Nigeria.

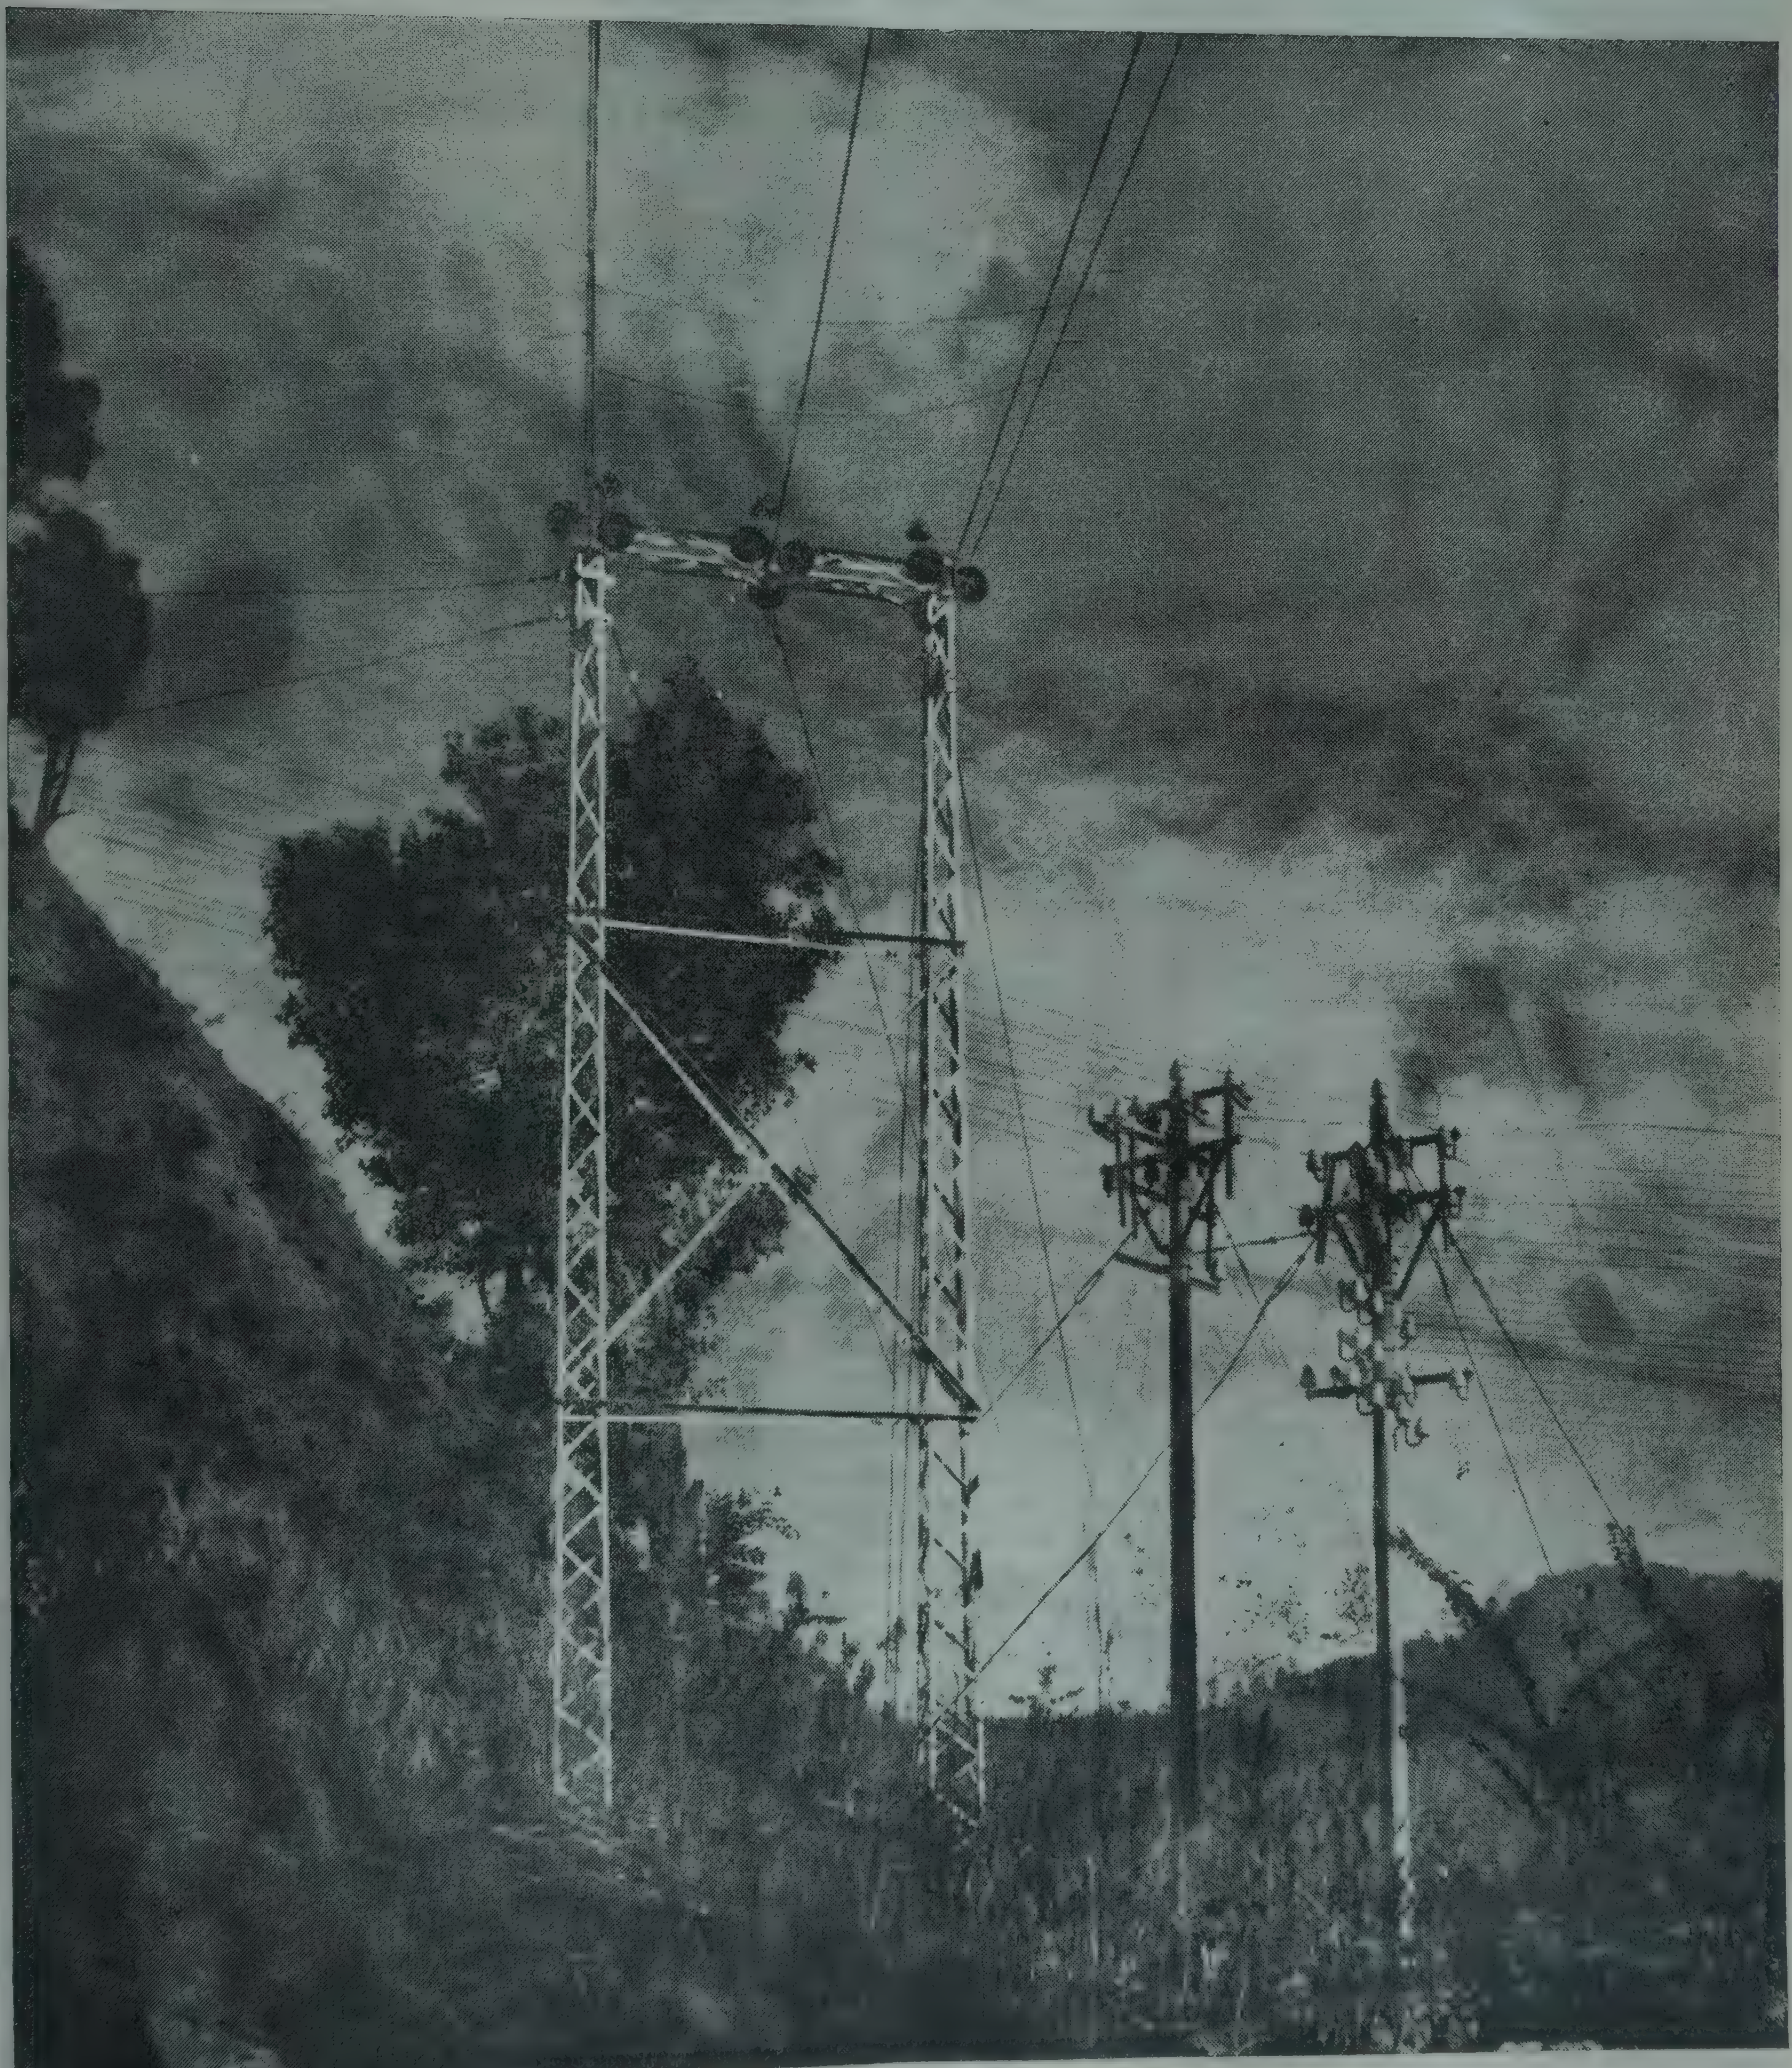
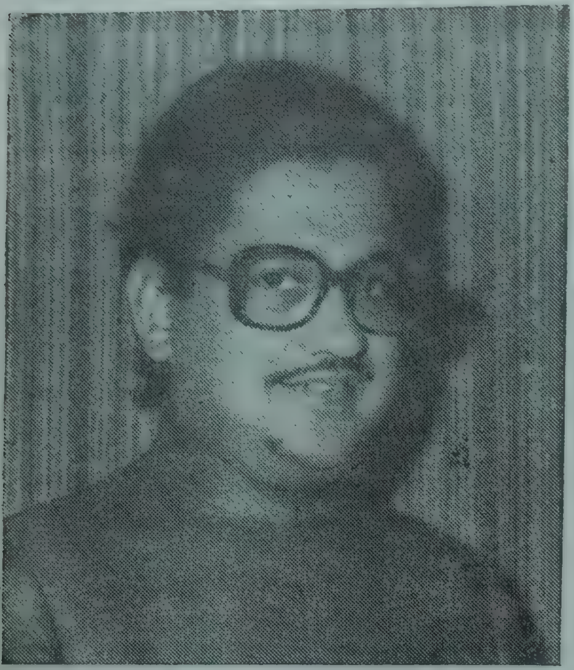
UP STATE ELECTRICITY BOARD

– A FEATURE





Efforts to speed up power development in Uttar Pradesh

By **SUNIL SHASTRI**

Deputy Minister for Energy, Uttar Pradesh

THE Uttar Pradesh Government is seriously concerned about the situation of power generation in the State. As has been its experience, breakdowns, often serious, occur now and then and such failures affect the life of the community. However, since the time the Chief Minister, Mr Vishwanath Pratap Singh, has taken the portfolio of energy under him, he has initiated some new policies and there has been quite an improvement. The Chief Minister is seriously trying to find out the causes of failures. For instance, in his inspection of the Obra thermal power station he found that the low generation there was mostly due to shortage of coal and the inferior quality of coal supplied to the plants. Human factors also contribute to the proper functioning of power plants. The staff of the State Electricity Board has many problems which also need to be resolved. Towards that purpose the UP Government has set up a Pay Commission and its report is expected soon.

The Chief Minister's move for participation of the workers and engineers in the management of the SEB has been hailed by all. It is expected that these steps will go a long way to facilitate better generation and supply of power and ultimately help the consumers as well as the workers.

On the orders of the Chief Minister, day-to-day monitoring of power supply also has been started. The Government is also seriously thinking of some other renovations in the management and functioning of the SEB with a view to ending the present power crisis.

As we know, power is the most important factor in the development of a nation. Without it, it is impossible to keep pace wth other countries. Ours is a backward country compared to many others and for our progress quick development is needed in agriculture and industry. Ours is mainly an agricultural country and there are still large tracts of agricultural land to be developed and made productive. We are trying to bring such areas under cultivation by introducing electricity in the rural areas. Electricity, in its progress into rural areas, has also helped establish small rural industries and inducing these areas to rise out of social and economic backwardness.

Our aim is to make power available in every part of UP for quick development of agriculture and industries, and for that we need more power than is being generated now. This Government is very much aware of this need and is trying its best to raise the installed capacity. Thirty-five per cent of the total outlay of the Sixth Plan (1980-85) is earmarked for this purpose.

Power projects are costly and during the last few plans it was somehow not possible to find the needed finances from our limited resources. In such cases Government has to take help from sources like the World Bank and other international agencies to ensure that progress continues on the projects taken in hand. Recently, the State Government has taken a decision to meet the entire cost of the Anpara 'B' thermal project from the provisions made in the Sixth Plan.

The Uttar Pradesh Government intends to meet in full the requirements of power in all spheres of the State by 1990 and its plans for increasing the generation have been drawn up with that end in view. At present the total installed capacity is 3,500 mw and the Government intends to raise it to 14,000 mw by the end of 1990.

It is expected that by the end of the Sixth Plan the installed capacity will be further raised by 2,000 mw and, during the Seventh Plan by another 7,400 mw. Besides these, the State is expected to get a larger share from the Central projects. All these will go a long way to meet most of our requirements.

Of the Central projects the most important ones are the Narora atomic power project and the thermal project in the area of Singrauli coal mines in this State. Work on these two projects is progressing satisfactorily.

Demand for power is increasing continuously in UP. It is expected to be 4,600 mw by the end of 1990. The State Government intends to raise power generation above the level of this demand by the end of 1990. Exploratory work is being done about possibilities of further expansion to meet any eventual demand in the future. This State is rich in rivers and there is vast scope for generation of at least 20,000 mw from hydel projects. At Singrauli also, there is scope for a thermal project capable of generating another 10,000 mw.

At present work is progressing speedily on 10 power projects of a total installed capacity of 3,082 mw. Some of these, namely, Parichha thermal project, Tanda thermal project and Unchhahar project, are expected to be completed during the current plan period. Besides, rapid progress is being made on five hydel projects—Tehri Dam (1,000 mw), Lakhwar Vyasi (300 mw), Yumuna (Stage-II) (Khodri) (120 mw), Maneri Bhali (90 mw) and Vishnuprayag (262 mw).

These go to show how alive the present government is to the need of regular and adequate supply of power for the progress of this State and well-being of its people. Presently we are passing through a critical stage but we are sure we will overcome the difficulties with the help and understanding of the people.

Power development programme in Uttar Pradesh

Manaribholi power house and dam under construction

POWER development in Uttar Pradesh has been far behind the national level of generation and consumption. The per capita consumption of power in UP was 86.57 units at the end of 1979-80 against all-India figures of 130.48 units. The achievements in the power sector in UP at the beginning of the Sixth Five Year Plan 1980-85 have been as follows :

(i) installed capacity (derated)	
(a) Thermal	2,202 MW
(b) Hydro	1,068 MW
	3,270 MW
(ii) Main transmission lines	
(a) 400 kV	762 Km
(b) 220 kV	3,210 Km
(c) 132 kV	7,476 Km
(iii) Rural electrification	
(a) Villages	38,577 Nos
(b) P.T.Ws.	3,44,135 Nos
(c) Harijan bastis	14,014 Nos

The demand for power continued to ncrease at a faster rate than the installed apacity in various years, with the result hat State had to face an acute power hortage year after year.

Demand for power

According to the indications of the Eleventh Annual Power Survey (XI APS), at present being conducted by Government of India, the peak and energy demands in UP are likely to be as follows :

Year	Peak demand (MW)	Energy requirement (Million units)
1981-82	3,400	17,586
1982-83	3,824	19,788
1983-84	4,234	21,810
1984-85	4,750	24,500
1989-90	8,600	44,000

Table I : Power generation in UP

Name of project	Total capacity (MW)	Likely benefit during 1980-85	Commissioning schedule
A — Hydro			
(i) Garhwal—Rishikesh—Chilla	4×36	144	1980-81*
(ii) Yamuna State-II (Khodri)	4×30	120	1982-83
(iii) Maneri Bhali-I	3×30	90	1983-84
B — Thermal			
(iv) Obra Extn. III	2×200	400	3/81*, 10/81
(v) Parichha	2×110	220	8/82, 2/83
(vi) Tanda	4×110	330	12/83, 6/84, 12/84
(vii) Anpara 'A'	3×210	630	6/83, 12/83, 6/84
Total ..		1,934 MW	
C — Central products			
(i) Singrauli super thermal station	5×200 2×500	600	(Balance 250 MW share after 31-3-85)
(ii) Narora atomic	2×235	100	(Balance after 31-3-85)
Total ..		700 MW	

---

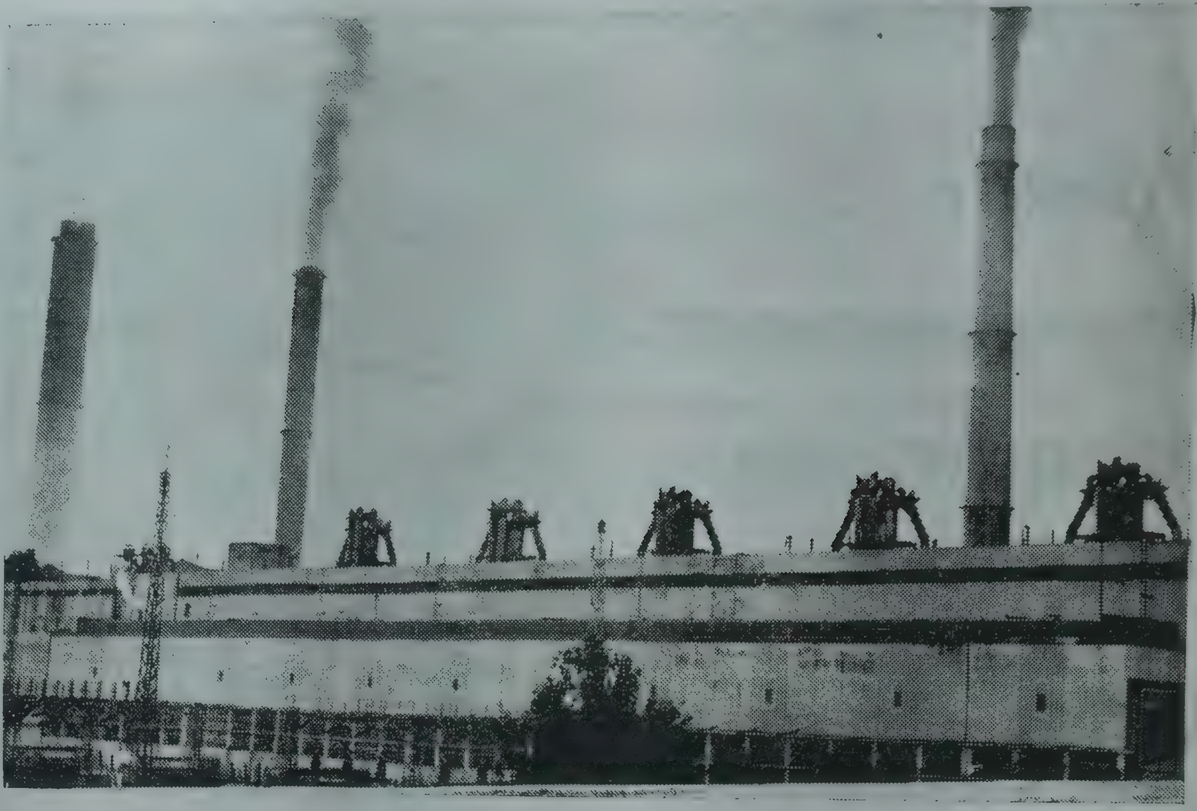
* Commissioned as per schedule.

In the above projections the average growth rate has been assumed as 13 per cent for industries, 16 per cent for irrigation and dewatering, 15 per cent for domestic and commercial and 8 per cent for railway traction.

Sixth Five Year Plan (1980-85)

The outlay in the power sector for UP for Sixth Plan 1980-85 has been estimated at Rs 2,153 crores, with major break-up as follows :

	(Rs in crores)
I. **Generation :**	
(i) On-going schemes	871.11
(ii) New schemes	418.55
	1,289.66
II. **Transmission and distribution**	640.00
III. **Rural electrification**	212.44
IV. **Survey and investigation** ..	10.90
Total ..	2,153.00



Obra thermal power station, Obra, Mirzapur

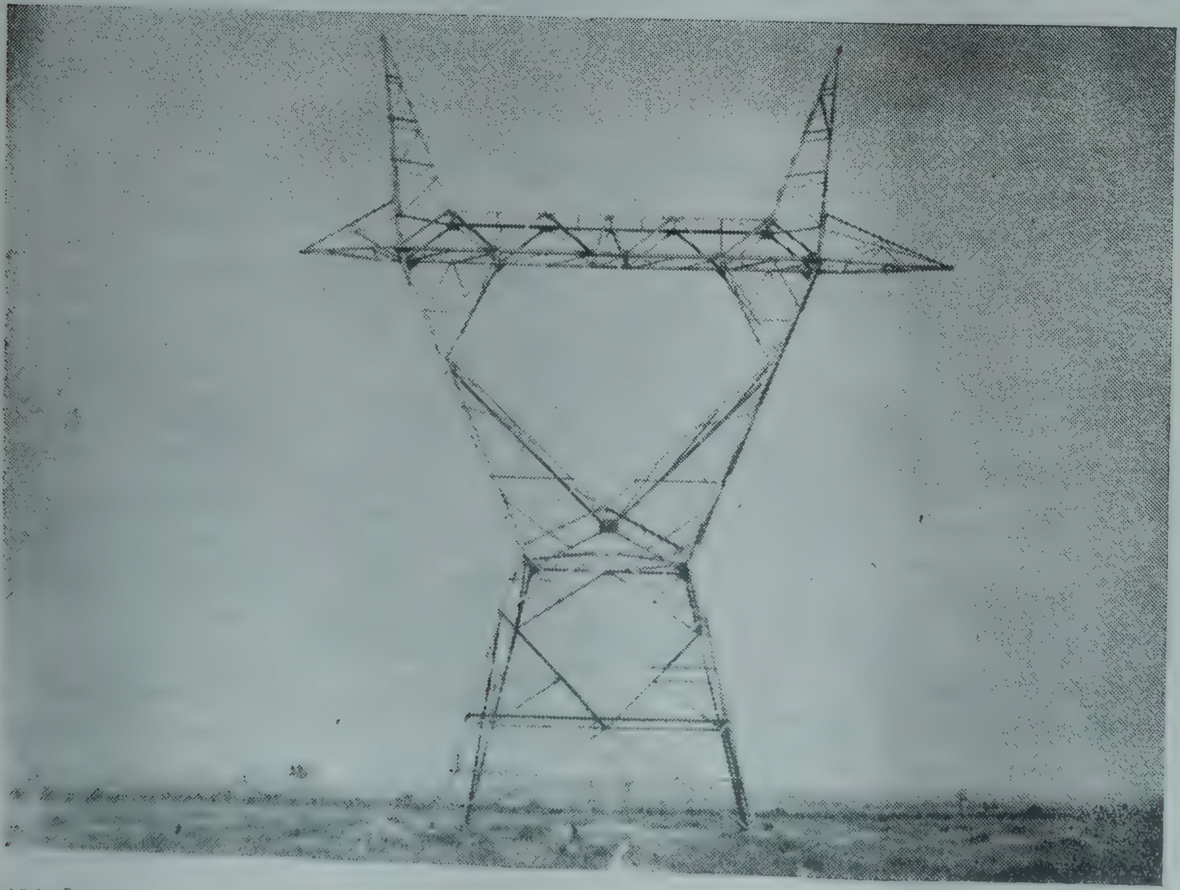
Generation programme

As stated at the beginning the total installed generating capacity (derated) in the State was 3,270 mw on April 1, 1980. An additional benefit of 1,934 mw is expected from the on-going projects and 700 mw from Central projects during 1980-85 plan (see Table 1).

Other generation projects which have been approved by the Planning Commission and are expected to yield benefits after the Sixth Plan 1980-85 (see Table 2).

Table 2 : Power projects to be commissioned after 1980-85

Name of project	Total capacity (MW)	Likely benefit during 1985-90	Commissioning schedule as per revised Plan
A — Hydro			
(i) Maneri Bhali-II	4×64	256	1987-88
(ii) Lakhwar Vyasi	420	420	1989-90
(iii) Vishnu Prayag	4×65.5	—	1990-91
(iv) Tehri Dam	4×250	—	1991-92
B — Thermal			
(v) Tanda	4×110	110-4th unit	1985-86
(vi) Unchahar	2×210	420	1984-86
C — Central projects			
(vii) Singrauli Super Thermal Station	5×200 +2×500	250	6th and 7th Plan periods.
(viii) Narora Atomic	2×235	100	
Total ..		1,556 MW	



400 kv transmission tower

After taking into account the benefits of the above projects, there will be shortage of about 3,250 mw in peak demand and 14,000 million units in energy requirement in UP by the end of Seventh Plan in March 1990.

New projects

To reduce the gap between demand and supply of power in UP during the Sixth and subsequent Five Year Plans, a number of new hydro and thermal schemes were proposed by the State and are under examination in the Government of India (see Table 3).

In order to cope up with the future demands of power in the State, investigation of new schemes, both hydro and thermal, has been taken up on a large

Table 3 : New hydro and thermal Projects under examination

Name of project	Installed capacity (MW)	Estimated cost (Rs crores)

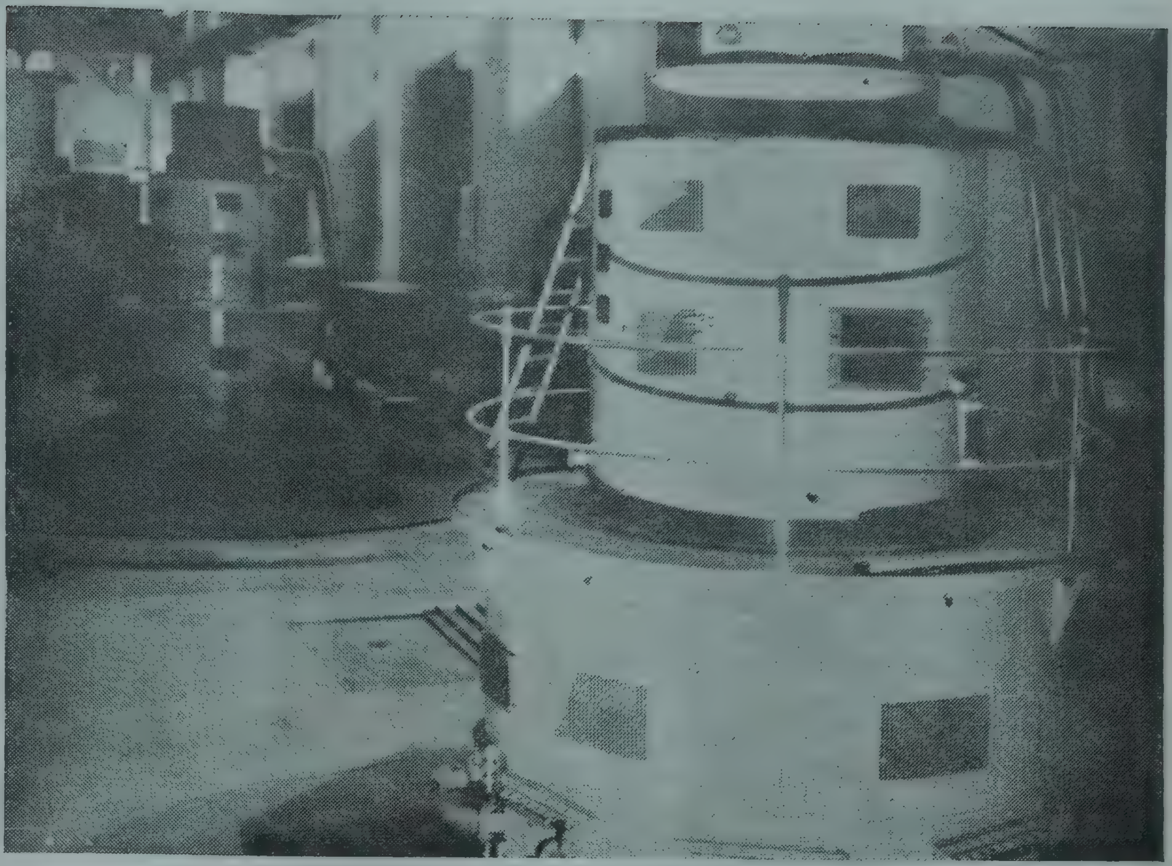
* Project report under finalisation.

scale. Details of investigation work are given below :

Hydro : In the report of the Working Group on Energy Policy issued in November 1979, it has been recommended that hydro-electric power development should receive a high priority. Therefore, several hydro-electric projects have been included for survey and investigation during the five year period 1980-85 (see Table 4).

Thermal : Schemes for thermal power proposed for investigation during the five year period 1980-85 are given in Table 5.



Chila power generators

New facets of rural electrification

UTTAR Pradesh covers an area of 2,94,413 sq km with 325 towns and 1,12,561 inhabited census villages as per 1971 census. Out of a population of 88.34 million in UP as per 1971 census, 75.95 million or 85.97 per cent lives in villages. Rural electrification is an important aspect of rural development as it gives boost to cottage industries, irrigation, education, drinking water etc. Therefore, special importance is always assigned to rural electrification as it is closely interlinked with food production, besides giving more employment opportunities to the rural population which is the key factor in the socio-economic transformation in rural areas.

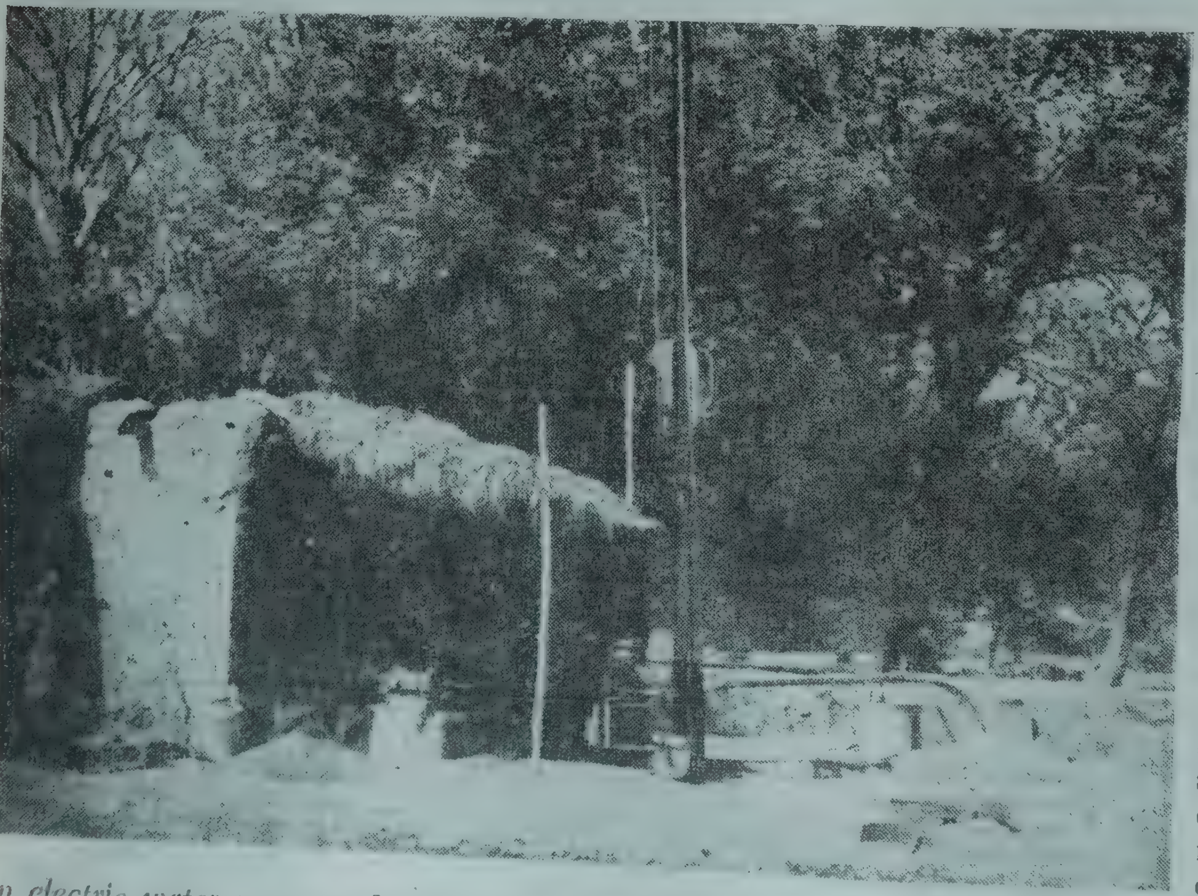
After independence the country adopted the path of planned overall development through five year plans in which rural electrification was one of the important components. However, the emphasis in this respect has been changing during the course of time to meet the requirements of economic development on which rests social development also. During the Three Five Year Plans (1951-56, 1956-61 and 1961-66) electricity was considered as a social amenity and, therefore, emphasis was laid simply on electrification of villages. The Third Plan had also laid special emphasis on the establishment of state-wise grid networks providing the basic framework for the development of a more comprehensive rural electrification programme for the development of rural industries with a view to creating additional employment opportunities.

However, drought conditions, which prevailed in the country for many years in the mid-sixties and the consequent chronic food shortages led to changes with emphasis shifting from rural electrification and development of rural industries to increasing the agricultural production through a programme of massive exploitation of ground water resources. An agricultural crash programme was launched by the UP Government in October 1965 under which private farmers were encouraged to bore tubewells/pump sets for assured irrigation and the State Electricity Board geared itself up for massive energisation of these PTW/PS besides state tubewells, the number of which was also substantially increased. Thus, while there were only 9,283 PTW/PS and 7,675 State tubewells energised till March 1966, 82,694 private tubewells/pump sets and 1,494 state tubewells were energised during 1966-70, thus laying the foundation for assured irrigation to the farmers which culminated in the green revolution in the State.

Table I: Progress of rural electrification in UP under the Plan

Sl. No.	At the end of	PTW/PS energised	Villages electrified	Harijan bastis electrified
1.	Pre-plan period	635	110	N.A.
2.	First Plan	1,429	420	N.A.
3.	Second Plan	3,566	1,082	N.A.
4.	Third Plan	9,283	5,855	N.A.
5.	Three annual plans (1966-69)	65.513	12,926	N.A.
6.	Fourth Plan	216,446	29,765	5,960
7.	Sixth Plan	307,990	36,298	12,453

N.A. = Not available.



An electric water pump and flour mill at work in a village in Rae Bareli

In 1969 on the occasion of Gandhi centenary celebrations, special importance was given to provision electricity for domestic and rural industrial purposes to the villages and particularly Harijans. Table I shows the progress of rural electrification at the end of various five-year plans.

UP is richly endowed with underground water resources with about 30 per cent of the ground water potential in the country. The soil is fertile and the general climatic conditions conducive to intensive agricultural production. The State, therefore, has a very large potential of tubewells and pump sets for exploitation of its ground water and agricultural potential. Since the bulk of the rural population is dependent on agriculture, the role of electricity in the villages has a special significance with respect to agricultural uses and it comprises mainly of irrigation by utilisation of ground water resources and the use of electricity for other allied agricultural purposes such as threshing, milling etc. The main plan of rural electrification in the State at present is, therefore, the energisation of irrigation tubewells and pump sets.

In the Sixth Plan the concept of Integrated Rural Development (IRD) has been introduced, the social uplift and wellbeing of the rural poor being its cardinal objective. Development of proper infrastructure for rural electrification has, therefore, become all the more important in achieving the objective of integrated rural development. Accordingly, priority has been given to rural electrification works in the State during the Sixth Plan period. Table 2 depicts the programme of rural electrification in the State during the Sixth Plan.

Rural electrification being a massive project involves a huge amount of investment. The rural electrification works are being executed by the State Electricity Board out of funds provided by the State Government, Rural Electrification Corporation Ltd (REC), Agricultural Refinance Development Corporation (ARDC) and other financial institutions. Briefly stated these are:

State Normal Programme: This programme is financed from the funds provided by the State Government.

REC (Normal) Schemes: These are area based schemes financed by REC Ltd, New Delhi. Normally these schemes are for comparatively less backward areas.

Revised Minimum Needs Programme (RMNP) Schemes: These are also area based schemes financed by REC. These schemes are for more backward areas.

Special Programme Agriculture (SPA) Schemes: In these schemes basically the electricity connections for irrigation tubewells/pump sets are provided in the virgin areas i.e. the areas which are not covered under REC/RMNP schemes. This scheme has been introduced recently by REC to give impetus to the programme of energisation of tubewells/pump sets and schemes are financed jointly by REC, ARDC and commercial banks.

Agricultural Re-finance Development Corporation (ARDC) Scheme: Under this scheme the State Electricity Board first energises private tubewells/pump sets through its own finances which are subsequently reimbursed as loan by ARDC.

Besides the above the State Electricity Board has also a 'Deposit Scheme' under which the consumer can deposit the entire amount involved in the energisation of his tubewell/pump set and

Tehri Dam Project

THE principal tributaries of the river Ganga, namely the Bhagirathi and Alaknanda, flow together at Deoprayag, about 66 km upstream of the town of Rishikesh, to form the Ganga. The river traverses down through a deep gorge with steep bed slopes and a number of cascades.

To meet the growing power needs of Uttar Pradesh and to harness the available irrigation potential of river Ganga, implementation of the Tehri Dam project, has been undertaken. This will help the State to overcome power shortage to some extent as well as generate fresh irrigation potential which is essential for improving the economy of the State.

The Tehri Dam Project would be a multi-purpose development project, comprising the construction of a 260.5 metre (above foundation level) rockfill dam across the Bhagirathi, 1.5 km below the confluence of Bhilangana river with it. The project envisages installation of 1,000 mw in Stage I in an underground power house located on the left bank. Provision for increasing the installed capacity to 2,000 mw ultimately has been made in the overall planning. The annual energy generation in the initial stage has been estimated at 2,910 million kwh on 90 per cent availability basis and 3,567 million kwh on the average availability basis. The project would also afford irrigation benefits of an additional 0.27 million hectares of land

The power evacuation will be through 400 kv double circuit line to the nearest grid substation at Rishikesh. Power for construction work will be supplied by the existing 66 kv system.

The project is located in the Tehri Garhwal district of Uttar Pradesh. The most important city nearest to the project is Rishikesh which is also a broad gauge rail head situated about 82 km south of the project area and is connected by a hilly road.

Project features

The project involves the construction of various structures as follows.

(i) Four 11 metre diameter diversion tunnels, two on either flank of the dam (two of them on left bank to be used as tail race tunnel).

(ii) A 260.5 metre high (above deepest foundation) earth and rockfill dam across the river Bhagirathi.

(iii) A chute spillway with a capacity of 11,000 cum/sec having five bays of 16 metre width and 12.15 cum high radial gates.

(iv) Two intake structures with vertical and submerged cylindrical tower, situated just over left bank diversion tunnels.

(v) Main penstocks, 5.73 m. internal diameter and steel lined. Each penstock will feed one 250 mw machine.

(vi) A 22.5 metre wide, 135 metre long main power house underground cavity on the downstream side of dam on the left bank, about 300 metre below the ground surface.

(vii) The generating plant consisting of four Francis vertical shaft turbines with an output corresponding to 250 mw output of the generator.

(viii) A 400 kv switchyard with adequate number of feeder bays etc. Table 1 gives salient features of the project.

Estimate of cost

The total cost of the project based on prices in 1980 is estimated to Rs 827.30 crores. This covers cost of land, dam, spillways tunnel, power house having installed capacity of 1000 mw, 400 kv switchyard etc including necessary infrastructure.

As per current programme, the project is likely to be completed by the end of the year 1991-92.

A total of 2,910 million units are expected to be generated annually at a cost of generation of 17.69 p/unit. Financial rate of return works out to 9.4 per cent.

Project implementation

The design, procurement, construction of civil works will be carried out by the UP Irrigation Department which has established the necessary infrastructure. The design, procurement, erection and commissioning of electrical equipment will be carried out by Hydro Electric Project Organisation of UPSEB.

A broadbased management organisation headed by a General Manager of Chief Engineer's rank already exists to administer and construct the Tehri Dam Project. The team will be further strengthened.

At present, the work of building of roads, colonies etc, excavation of diversion tunnels and stripping treatment for the dam site are in progress.

Table I : Salient features of Tehri Dam Project

1. Location :	On river Bhagirathi, about 1.5 Km. downstream of the confluence of rivers Bhagirathi and Bhillangana in district Tehri, Uttar Pradesh.
2. Reservoir :	
(a) Full supply level (Normal maximum reservoir level)	830 m.
(b) Dead storage	740 m.
(c) Live storage	2615×10^6 m^3
3. Dam :	
(a) Type	Rock fill
(b) Height of dam (above river bed)	245.5 m.
4. Power House :	
(a) Location	Left bank, underground
(b) Head	188 m.
(c) Turbine	4 Nos. Francis, vertical shaft
(d) Generators	4 Nos. 250 MW, 16 kV
5. Switch Yard :	
(a) Location	Left bank-surface
(b) H.T. cable	400 kV feeders
6. Firm Power :	201 MW
7. Installed Capacity :	1000 MW
8. Cost :	
(a) Total	Rs. 827.30 crores
(b) Share of Irrigation	Rs. 346.00 crores
(c) Share of Power	Rs. 481.30 crores
9. Benefits :	
(a) Power	2910×10^6 Kwh
(b) Additional annual irrigation	2.70 lakh hectare.

Anpara 'A' thermal power project

Anpara power station under construction

THE Anpara thermal power station, is located in district Mirzapur of Uttar Pradesh on the left bank of Rihand reservoir, in the vicinity of Singrauli Coalfields. It has an installed capacity of 3 x 210 mw.

Anpara is one of the most ideal sites for locating a large size thermal power station, as all the following basic parameters excepting nearness to load, are available at this place:

(a) Availability of coal with minimum distance of transport.

(b) Sufficient cooling water round the year.

(c) Availability of land.

(d) Far away from thickly populated area from considerations of pollution.

Moreover, the project site has the advantage of having National Highway No. 51 Singrauli-Pipri Road, passing nearby. Indian Railways are also constructing a loop line for different collieries being developed in the area and connecting the same with main Chopan-Singrauli-Katni line. The above railway line, which is expected to be ready up to Bina coalfields by middle of 1981 will pass very near to the proposed Anpara site.

Presently three units of 210 mw are being installed. Land has been acquired, and lay-out planned in such a manner that common facilities like cooling water system, coal and ash-handling, marshalling yard and other common auxiliaries as also ancillary buildings could easily be augmented to cope with ultimate capacity of 3,130 mw by the installation of additional 5 units of 500 mw each in two stages.

Project report for installation of 3x210 mw Anpara 'A' thermal power project was submitted to the Government of India in July 1977. The Planning Commission accorded its approval to the project amounting to Rs 227.19 crores, in January 1979. Since then, the cost estimate of the project has been revised in view of cost escalations, and the revised cost of the project is Rs 344.83 crores.

The salient features of the project are as follows:

I. **Location:**

1. Near village Anpara on the left bank of Rihand reservoir near Renusagar Thermal Power Station.
2. Situated at a distance of 30 km. from Rihand dam on Pipri-Singrauli road.
3. 5 km from Kakri and 10 km. from Khadia Blocks of Singrauli Coal Fields.
4. 15 km from Singrauli Rly. Station on Billi-Katni line and 5 km. from Kakri Rly. Station on proposed Karela road-Jayant Rly. line (Eastern Rly).

II. **General:**

1.	Land	500 hectares
2.	Coal	2 million tonnes per year
3.	Ash	0.6 million tonnes per year
4.	Water	1000 cusecs
5.	Manpower	1500

III. **Technical:**

1.	Installed capacity of proposed power station	630 MW
2.	Boilers	3 Nos. of radiant, dry-bottom, natural circulation, vertical water tube type CE design boiler with single reheat 680 tonnes/hr. of steam at 158 Kg/cm^2 pressure and 540°C temperature.
3.	Turbine and turbo-generators	3 Nos. of 210 mw of kwu West Germany design, condensing type, tendem compound, three cylinders with 150 ata & 535°C inlet steam condition.
4.	Cooling system	Once through cooling system. From Rihand Reservoir 36°C (Maximum design temp.)
5.	Water treatment plant	4x75 tonnes/hour capacity.
6.	**Outdoor switchyard:**	
6.1	Power transformers	3 Nos. 250 MVA, 15.75/400 kV.
6.2	Interconnecting transformers	2 Nos. 100 MVA, 400/132 kV.
6.3	Outgoing feeder 400 kV	Single circuit to Azamgarh Single circuit to Obra TPS Single circuit to Singrauli STPS.
	132 kV	Double circuit to Rihand P/H. Double circuit to Amarkantak (MP).

IV—Financial: The latest estimated cost of the project is Rs 344.83 crores. Annual generation will be 3067.5 million units at a cost of generation of 26.70 paise/unit.

V—Project schedule : The first unit at this project is expected to be commissioned in June 1983 and the remaining units at intervals of 6 months thereafter.

VI—Funding of the project: Anpara 'A' power project was proposed by the Government of India to Kuwait Fund for Arab Economic Development for financing. An agreement has been finalised between the Government of India and Kuwait Fund for financing part cost of this project. The loan agreement has been executed in two parts as follows:

(i) For KD 16,000,000 (equivalent to Rs 52 crores at the present exchange rates) for financing 26 per cent of total expenditure towards the cost of steam turbogenerators, boilers and all auxiliary plant and equipment.

(ii) For KD 9,000,000 (equivalent to Rs 29 crores at the present rate of exchange) for financing the following items on coal transportation and handling system:

(a) 100 per cent cost of construction of railway loop for coal transport (KD 3,700.000).

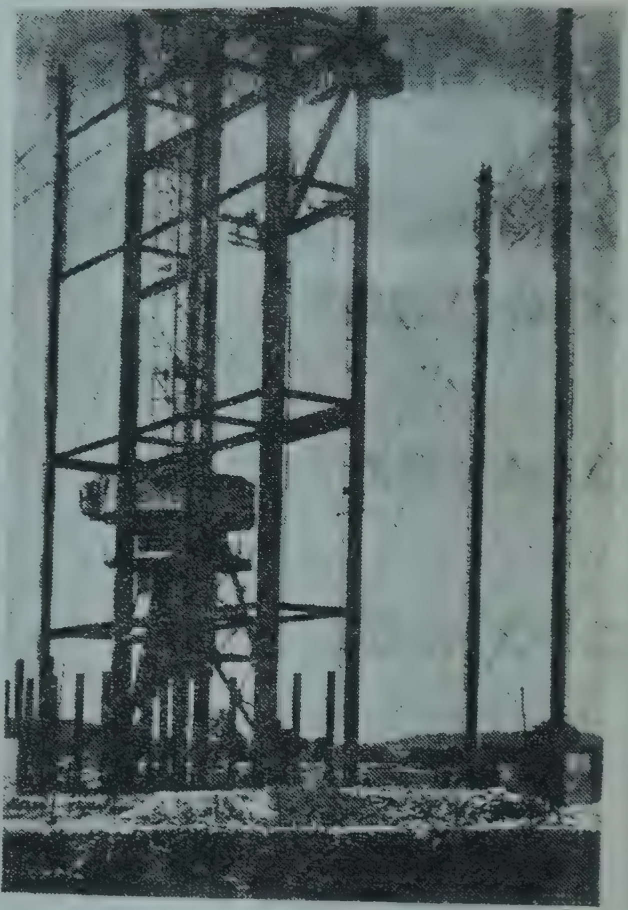
(b) 100 per cent cost of locomotives and wagons (KD 2,400,000).

(c) 21 per cent of the expenditure towards supply and erection of coal and ash-handling equipment (KD 2,200,000).

(d) Contingencies (KD 700,000).

First part of the agreement was signed in the second week of May 1981 in Kuwait during the visit of Hon'ble Prime Minister of India. The second part of the agreement is expected to be signed in September/October 1981.

The part financing of the Anpara project under Kuwait Fund will ease the cash flow on the project, and it is hoped that this will lead to completion of the project on time.



Another section of Anpara power station under construction

New facets of rural electrification

Concluded from page vii

the portion of the amount which, normally, is to be borne by the board is returned to the consumer alongwith interest on it after five years.

Table 3 appearing on page vii, gives schemewise financial outlays and targets of various rural electrification works during Sixth Plan.

The UP State Electricity Board is well aware of its responsibilities to achieve the object of integrated rural development and the basic concept of the Sixth Plan, and is making all-out efforts to extend electricity to far-flung remote areas of the State. Rural electrification from the viewpoint of investment by the board is a losing proposition. However, inspite of incurring heavy losses in rural electrification works, the board is not shirking its social responsibility in the upliftment of rural folk.

A Harijan basti in a village with electric lights

Power incentives to entrepreneurs

ELECTRICITY is universally accepted as a powerful tool for increasing productivity. It essentially serves as a basic input for the growth of industries. In order to encourage entrepreneurs for setting up industries in the State, the UP State Electricity Board has initiated various steps for expeditious load sanction and concessions in tariff. These are enumerated as below:

Application for power loads and their sanctions

(a) The application forms for sanction of loads are available free of cost in the offices of the Executive Engineer, sub-divisional officers and block development officers. The prospective consumers are required to submit application forms duly filled in along with the earnest money of Rs 25.00 (adjustable in service connection charges) in the office of concerned executive engineer. The application form should either be in the name of owner of the premises or legal tenant.

(b) The industrial loads up to 25 bhp are sanctioned by the committee comprising the following at the district level:—

(i) District Magistrate—chairman.

(ii) Additional District Magistrate (Planning)/District Planning Officer—member.

(iii) District Industries Officer—member.

(iv) Executive Engineer (Distribution) Member—Secretary.

The loads of powerlooms up to 5 bhp are sanctioned by the executive engineer concerned of the Board.

(c) The new and additional industrial loads above 25 bhp and up to 100 bhp are sanctioned by the regional committees with each committee comprising the following members subject to the condition that the total load after sanction of the additional load should not exceed 100 bhp in any case:

1. Regional Manager, U.P. Financial Corporation—Convener.

2. Chief Zonal Engineer, UPSEB/G.M. KESA, Kanpur or his nominee not below the rank of Superintending Engineer of that Region—Member.

3. Dy. Development Commissioner—Member.

4. Joint Director (Industries)—Member.

(d) The loads above 100 bhp are sanctioned by the State Government according to the policy laid down in this regard.

The industrial consumers are required to obtain necessary certificates for the current year from Cane Commissioner for operating cane crushers, from district/municipal medical officer of health for manufacture of ice candy/ ice cream and from regional foods controller for operation of rice hullers.

Terms and conditions for electric connections

(a) After the load is sanctioned the terms and conditions along with the intimation about the amount of service line charges and security, are sent to the consumer for execution of the agreement.

(b) Where the distribution mains are already laid, for each new connection the Board constructs 30 metres (100 feet) service line on public land free of cost. For excess length of the line the prospective consumer has to deposit the cost of such line in advance, which is constructed by the Board. The estimated cost of service line is to be deposited by the prospective consumer in advance which is adjusted subsequently according to actual expenditures.

Where the distribution mains are not laid the entire cost of construction of 11 kv/0.4 kv line is to be deposited by the prospective consumer in advance.

(c) The service line charges for power loads up to 20 kw have been standardised. The service line charges for loads above 20 kw are payable as per estimated costs. The cost of transformers is borne by the Board.

(d) The facility of having independent feeder from 33 kv sub-station is admissible to large and heavy power consumers at the discretion of concerned Chief Zonal Engineer. Such consumers are required to pay in advance the cost of switchgear to be installed at the start of the feeder and the cost of line from the sub-station to his premises. The connections to arc furnaces are not given below 33,000 volts.

(e) Security

The prospective consumers are rerequired to deposit the security at the following rates before the execution of the agreement. The security is accepted in cash only and an interest @ 3 per cent per annum is allowed at the close of the financial year through the electricity consumption bill (s):

Particulars	Rate of security deposits
(i) Small and medium power consumers having loads up to 10 bhp	Rs. 45.00 per bhp
(ii) Large power consumers having loads above 75 KW (100 bhp) and up to 200 KW (235 KVA)	Rs. 75.00 per Kw
(iii) Heavy power consumers having loads above 235 kVA	Rs. 90.00 per kVA

The small and medium power consumers are required to deposit the amount of security in full before the execution of agreement. The large and heavy power consumers have been given facility to deposit the 50 per cent amount of security before the execution of the agreement. The balance 50 per cent security is realised in four annual equal instalments in respect of consumers executing the agreement for five years and after one year from the consumers executing agreement for two years.

(f) The small and medium power consumers (up to 100 bhp) are required to submit the declaration on standard form for a period of two years after depositing the estimated cost of giving connection and the security deposits. The large and heavy power consumers are required to execute the agreement for a period of two/five years on the standard form. The declaration is to be submitted or the agreement is to be executed on a non judicial stamp paper worth Rs 5.00 whereupon a revenue stamp of twenty paise is also to be affixed.

After the submission of the declaration or execution of agreement by the prospective consumers the work of construction of lines and sub-station is taken in hand.

Inspection of installations and release of connections

The prospective consumers are required to deposit the inspection fee at the prescribed rates in the treasury and thereafter submit a copy of the treasury challan and the necessary B & L form before the connection is released. The installation of the consumer is inspected and checked and if it is found that the installation fulfils the requirement of Indian Electricity Rules 1956 then only the supply is released.

Concessions in tariff

The following concessions are admissible to the power consumers in the tariff:

(a) All the new industrial units connected on or after August 1, 1980 are exempted from the payment of minimum consumption guarantee for a period of one year from the date of commencement of supply. This facility is also admissible to the existing connections who had not completed one year on August 1, 1980 from the date of commencement of supply, for the unexpired period of one year.

(b) In respect of new connections as may be located in any of the eight hill districts in Uttar Pradesh but excluding those existing at a height of less than 2,000 feet above MSL (mean sea level) in Dehradun and Nainital districts, a development rebate of 33 1/3 per cent is admissible to a new industrial unit for a period of five years from the date of commencement of supply. This rebate is also admissible for the unexpired period of five years to those existing industrial units which had not completed five years on August 1, 1980 from the date of commencement of supply. This rebate is not admissible on the amount of minimum consumption guarantee.

(c) In respect of connections as may be located in Bundelkhand region comprising Jhansi, Lalitpur, Hamirpur, Jalaun and Banda districts, a development rebate of 50 per cent is admissible to a new industrial/agro-industrial unit connected on or after August 1, 1980, for a period of five years from the date of commencement of supply. This rebate is also admissible for the unexpired period of five years to those existing industrial/agro-industrial units of the above districts or Bundelkhand region who had not completed five years on August 1, 1980 from the date of commencement of supply. This development rebate is not admissible on the amount of minimum consumption guarantee and is also not allowed to the State tube-wells, pumped canals, lift irrigation schemes, drinking water supply schemes, railways and departments/corporations/undertakings of the State and Central Governments and local bodies.

(d) In respect of connections as may be located in districts other than those comprising Bundelkhand region and hill areas mentioned above, a development rebate of 10 per cent is admissible to a new large and heavy industrial unit for a period of three years from the date of commencement of supply. The rebate is also admissible for the unexpired period of three years to those existing industrial units in the above areas which have not completed three years on August 1, 1980 from the date of commencement of supply. The rebate is however, not admissible on the amount of minimum consumption guarantee.

(e) During the first year of the supply the new industrial units connected on or after August 1, 1980 are liable to pay for the actual maximum demand only. This facility is also admissible to the existing industrial units for the unexpired period of one year who have not completed one year on August 1, 1980 from the date of commencement of supply.

Exemption from power cut

The new industrial units connected on or after August 27, 1980 are exempted from demand cut for a period of five years from the date of commencement of supply. This facility is also admissible to those industrial units for the unexpired period of five years, who have not completed five years on August 27, 1980 from the date of commencement of supply.

Expeditious sanction of connections to new entrepreneurs

The UP Government has formed a "High Power Committee" to look into and redress the problems being faced by entrepreneurs in installation of new large, medium and small scale industries in the State. As per the decision of the committee a "Udyog Bandhu" Cell has been established in PICUP which works as the Secretariat to the High Power committee.

The UP State Electricity Board has joined hands with UPSIDC, UPFC, Directorate of Industries and PICUP to redress the various problems of entrepreneurs. Spot sanction is provided to new industrial loads under this programme and the problems regarding the release of new connections are resolved.

Incentives to farmers

THE economy of Uttar Pradesh is basically dependent on agricultural production. The agricultural production in turn depends on assured irrigation in which the energisation of private tubewells/pump sets plays a major role. The UP State Electricity Board is, therefore, making all-out efforts for maximum energisation of private tubewells/pump sets. Many incentives are provided to the farmers for availing of the facility of electricity. These are enumerated below:

Free cost concessions: The following free cost concessions are applicable to individual private tubewell/pump set connections for irrigation purpose only:

(a) (i) Cost of construction of 11 kv and LT line @ 60 metres per HP subject to a maximum of 300 metres per connection, and (ii) for five districts of Bundelkhand *viz* Jhansi, Lalitpur, Jalaun, Hamirpur and Banda, the above free limit is @ 80 metres per HP subject to a maximum of 400 metres per connection.

(b) Full cost of setting requisite distribution transformer sub-station.

Energisation of PTW/PS in clusters: For energisation of PTW/PS under clusters, the board bears the cost of line and substation up to the maximum extent of Rs 1,200 per BHP. In case expenditure involved is beyond the above limit, the amount is paid by prospective consumers in the ratio of their contracted load. Small and marginal farmers can make a cluster of four or five connections and can take the electric connections at these concessional rates.

Incentives to small and marginal farmers: A 15 per cent quota out of the yearly private tubewells/pump sets targets fixed under the State's normal programme is reserved for small and marginal farmers. A time bound programme has been framed for the release of connections to small and marginal farmers.

Flat rate tariff to PTW/pumpset consumers: A flat rate tariff of Rs 12/BHP/year is charged from PTW/PS consumers which works out to 12.97 paise/unit at 17 per cent load factor. These rates are quite low as compared to the cost of generation and except for one or two States, the rates are perhaps the lowest in the country.

Extra processes: With their private tubewells/pumping sets the consumers are allowed to operate chaff cutter, thresher, rice huller and cane crusher without paying any extra charge.

In respect of new connections as may be located in any of the eight hill districts in UP (Almora, Chamoli, Pauri-Garhwal, Pithoragarh, Tehri Garhwal, Uttarkashi, Dehra Dun and Nainital) but excluding those existing at a height of less than 2,000 feet above MSL in Dehra Dun and Nainital districts, a development rebate of 50 per cent on the amount of bill is given for a period of five years from the date of commencement of supply. This rebate is also admissible for the unexpired period of five years to those existing

Power development in UP hills

By K. L. MUKHERJEE

Power supply to Chamoli district in the UP hills

THE hill region of Uttar Pradesh represents a special case of economic backwardness. The abundant resources of the region have not yet been exploited to the desired level. The economy of the region, comprising the districts of Uttarkashi, Chamoli, Tehri-Garhwal, Pauri-Garhwal, Almora, Pithoragarh and some parts of Dehra Dun and Naini Tal districts is predominantly agrarian as about 75.3 per cent of the total workers are engaged in agriculture. Forests occupy about 67 per cent of the total geographical area of 51,122 sq km, out of which 41 per cent are well-stocked forests.

The factors inhibiting the pace of development of the hill region, among others, are its peculiar geographical conditions, the nature of the terrain, settlement pattern, inadequate essential infrastructural facilities of power, roads and irrigation, besides relatively high construction and transport cost, longer gestation period of programmes/projects and lack of diversification and institutional support. In terms of per unit capital cost, extension services/infrastructural facilities, the same level of investment produces half or even lesser facilities than in the plains.

Past neglect and backlog in respect of socio-economic development has resulted in sizable variation in the levels of development as compared to that of the State and other hill areas, particularly of Himachal Pradesh.

Pockets of tribal concentration in UP's hills are relatively more depressed and need more attention in providing essential infrastructural facilities as also basic social inputs.

Some indicators of disparities in percentage deviation from the State average are given in Table 1.

Table 1 : Indicators of disparities in percentage deviation from average in UP

Area	Value of agricultural produce per net hectare area sown		Intensity of cropping		Percentage of net irrigated area per hectare to net area sown		Per capita net output from commodity producing sectors		Per capita gross industrial produce		Per capita consumption of electricity		Growth rate (Per cent) of agriculture sector

SOURCE: Draft Sixth Five-Year Plan (1980-85)

Power is the most important infrastructure for economic and social development. Due to paucity of coal and fuel wood power has added importance for fuel energy.

Power development in the hill region has been lagging behind on account of long distance T & D lines, non-viable micro-generation schemes and difficult terrain of the area.

At the end of the Fourth Plan, the total installed capacity of micro-generation in the State was 4,992.4 kw. By the end of March 1980 this had gone up to 13.713.4 kw, inclusive of 7,450 kw installed capacity added to the State sector by taking over private electricity companies. The details of the break-up of capacity are given in Table 2.

The main objective of power development in the hill areas during the Sixth Plan (1980-85) is to accelerate the power development programme, specially rural electrification and maximum utilisation of hydel potential for micro generation schemes. Emphasis will be on speedy extension of T & D lines. Special measures aimed at reducing the cost of micro generation of power will be taken.

The progress during 1979-80 and proposed financial targets for power deve-

Concluded from page xii

connections which have not completed five years on August 1, 1980 from the date of commencement of supply.

The following table gives the yearly achievement of energisation of private tubewells/pump sets in the State during the past decade:

1971-72	30,665
1972-73	36,001
1973-74	33,159
1974-75	14,840
1975-76	10,593
1976-77	11,853
1977-78	24,888
1978-79	24,383
1979-80	36,145
1980-81	39,814

From the above it will be observed that a record number of private tubewells/pump sets have been energised by the UP State Electricity Board in 1980-81. An ambitious target of energisation of 41,270 private tubewells/pump sets has been fixed for the year 1981-82 thus leading to the path of breaking even the achievement of the last year.

lopment for the Sixth Plan are given in Table 3.

The physical achievements and additional targets for the Sixth Plan are given in Table 4.

The project estimates of four micro hydel schemes — three in Chamoli districts at Topowan, Therali and Sitapur Chatti with a total installed capacity of 1,370 kw and, one of 750 kw capacity at Suringad in Pitloragarh—have been cleared by the Planning Commission. These schemes on completion are expected to give benefits during 1983-84. Besides these, two new micro hydel schemes at Pilangad (2,000 kw) in Uttarkashi district and at Nagnath Pokhari (400 kw) in Chamoli district are being processed for approval of the Planning Commission.

India's steel plans and world trend

By P. C. MAHANTI

AFTER a fairly long break, there is now a plan of development for the Indian steel industry although it might be said that the capacity and production targets do not exactly match the demand projections made by expert bodies. In the Sixth Plan, capacity target for steel is only 14.6 million tonnes, as against the existing 11.4 million tonnes—a bare 3.2 million tonnes rise over a five-year period. And if we consider that most of the proposed additional capacity is to come from expansions, which have been going on over the past six or seven years, then the Sixth Plan programme provides for just for some marginal additions to capacity at best.

Table 1 furnishes the production and capacity targets for the Sixth Plan period, as well as the next five years.

It will be seen from Table 1 that the Sixth Plan capacity target is 16.9 million tonnes (including the mini plants' 2.343 million tonnes) and 14.6 million tonnes if the mini plants are excluded. The output target is 14.51 million tonnes including 1.8 million tonnes from mini steel plants.

The demand for steel by 1984-85 (in finished terms) is worked out at 12.7 million tonnes which would correspond to an output of roughly 16 million tonnes of ingots. whereas the Plan provides for a saleable or finished steel output target of 11.5 million tonnes of ingots only. There will thus be a fairly wide gap between the domestic availability of steel and the economy's requirements. It is worth noting that the demand for finished steel in 1980-81 was estimated at eight million tonnes, which shows at what rate the demand for steel is likely to grow. It is also estimated that the finished steel demand is likely to go up further to 18.4 million tonnes by the end of the Seventh Plan, that is 1989-90, but then the Plan, as it stands at present, provides, for a saleable steel output of 17.3 million tonnes only, which would leave a sizeable gap to be covered by imports.

On the face of it it would appear to be wrong planning, since there is no effort to build up sufficient capacity over a ten year period to match output with demand. But past experience has made our planners adopt a cautious attitude. They have realised that unless there is the assurance of adequate infrastructure support to the steel industry at all times, additions to capacity in haste would only lead to frustrations such as the public sector steel plants have just gone through or are still going through.

If dearth of trained personnel was the main constraint for the government-owned plants in the initial years, growing infrastructural deficiencies in respect of coal, power and transport has hamstrung steel plant operations throughout the second half of the 'seventies. The infrastructural difficulties are not entirely out of the way. In fact, with the ongoing expansions of Bhilai and Bokaro to 4 million tonnes by the end of the Sixth Plan, and more later, infrastructural problems could conceivably become serious again. So by paying the same attention to infrastructure as to capacity building, the planners show a sense of realism that ought to be appreciated in the context of the industry's current problems. But they should not be too cautious all the time.

Steel consumption in the world has been rising even allowing for the recession years, that is the net effect over a long period. At the moment, the world steel output appears to have

MODI
STEELS

THE FOUNDATIONS OF ALL INDUSTRIES ARE LAID HERE

This is the initial stage of steel production at Modi Steels where the scrap is melted into Steel, undergoing complete tests and checks.

Chemistry of Steel is controlled at the melting stage with a Spectrometer. Specified properties of the finished product are guaranteed and maintained at Modi Steels through extreme vigilance and modern testing facilities.

No wonder the finished products of Modi Steels namely Wires, Wire Rods, Galvanised Coated Wires, Fine Galvanised Wires and Billets for Forging Steels are in great demand in industry.

The Industries served by Modi Steels are General. Engineering, Construction, Spring manufacturers, Textiles, PVC and Telephone Cables, High Tensile Fasteners and Forgings for Automobiles, Tractors, Machinery etc.

MODI STEELS was started in the year 1963 with a modest capacity of 2000 tonnes a year. Today it has grown into a giant mini-steel plant with a capacity of 80,000 tonnes of wires and rolled products.

It has now embarked upon an ambitious expansion programme in technical collaboration with Daido Steel Co. of Japan. Under this programme, it aims at providing 100% import substitution in the field of Special and Alloy Steels, Cold Heading Quality Wires & Wire rods.

Modi Steels is thus geared to meet all the challenges of the EIGHTIES.

MODI STEELS
MODINAGAR. (U.P.)
(In Technical Collaboration with Daido Steel Co. Ltd. of Japan)

reached a plateau, as not much additional capacity is being created, but sooner or later, steelmaking all over the world is bound to resume an expansionary course. We have this picture (Table 2) of world steel capacity from a projection made by a well known US firm of consultants.

Table 2 : World steel capacity

(In million tonnes)

	1980	1985	1990	% change 1980-90
Industrialised countries	365.14	422.54	462.57	+ 27
Developing countries	104.96	163.06	234.25	+ 123
USSR & East European communist countries ..	229.59	268.71	314.06	+ 37
China and North Korea	155.19	78.87	109.69	+ 99
	754.40	933.18	1.120.84	+ 48

It will be seen that the projection visualises a higher rate of growth in the developing world to which India belongs. Besides India, other major steel producing countries in the developing world are China, Brazil, Mexico, South Korea, Taiwan, Argentina, North Korea and Venezuela. Between them these countries account for over 90 per cent of the total output in the developing world, and it is in these countries that major expansions have been projected. Given their natural resource endowments there is no reason why they cannot attain a 123 per cent growth. In all probability, they will.

These countries have been substantial importers of iron and steel as their output today is only 10 per cent of the world total, while their consumption requirements are much more. As they progress on the economic scale through more and more industrialisation, their consumption requirement is bound to increase steadily. To meet the growing requirement they must necessarily produce more themselves or import from developed countries as hitherto. The former is the more preferable course.

Even countries in West Asia, Nigeria and Libya in Africa and Indonesia in South East Asia who have no ronmaking resources of their own but have enough oil wealth to pay for machinery as well as raw material imports, have plans to build steel mills of their own. Indian metallurgical consultants, M. N. Dastur & Co, are assisting the construction of a steel plant in Libya and the public sector Metallurgical and Engineering Consultants is, helping build a large-sized steel plant n Nigeria. If these countries are setting up steelmaking capacity obviously or their own all round development, here is every reason a country like ndia, endowed with vast raw material esources, a highly skilled manpower nd technical consultancy expertise omparable to the best in the world, hould aim at a continuous expansion f its industry even to the point of roducing a surplus. The world steel arket is bound to grow, especially the eveloping half will consume more and ore. So India can even afford to ursue a long-term policy of exports nd not one of the stop-go variety it as been pursuing so long, shutting out exports altogether in years of steel shortage.

Indeed if the infrastructural constraint can be completely got out of the way—the Central Government, it is encouraging to find, attaches so much of importance to this problem that there is a special Cabinet subcommittee under the chairmanship of the Finance Minister—India ought to attempt a much bolder steel development programme in the Seventh Five Year Plan than it has permitted itself to do.

The present time is quite favourable for a consistently forward looking expansionary policy. The developed half of the world, especially the European producers including the United Kingdom and the United States have not been adding to capacity because of technological obsolescene of their plants which were built probably in the early half of the present century. This obsolescence makes the plants totally uncompetitive in the current context of economic integration of Western Europe. In the United States as well, high cost plants go ill with the highly competetive ethos of the modern capitalist system. So such obsolete capacity is being cut out, and the industries are slimming themselves to keep fighting fit in free market terms. But this slimming process cannot go on indefinitely without hurting the economies themselves and sooner or later, rebuilding and expansions will have to start again.

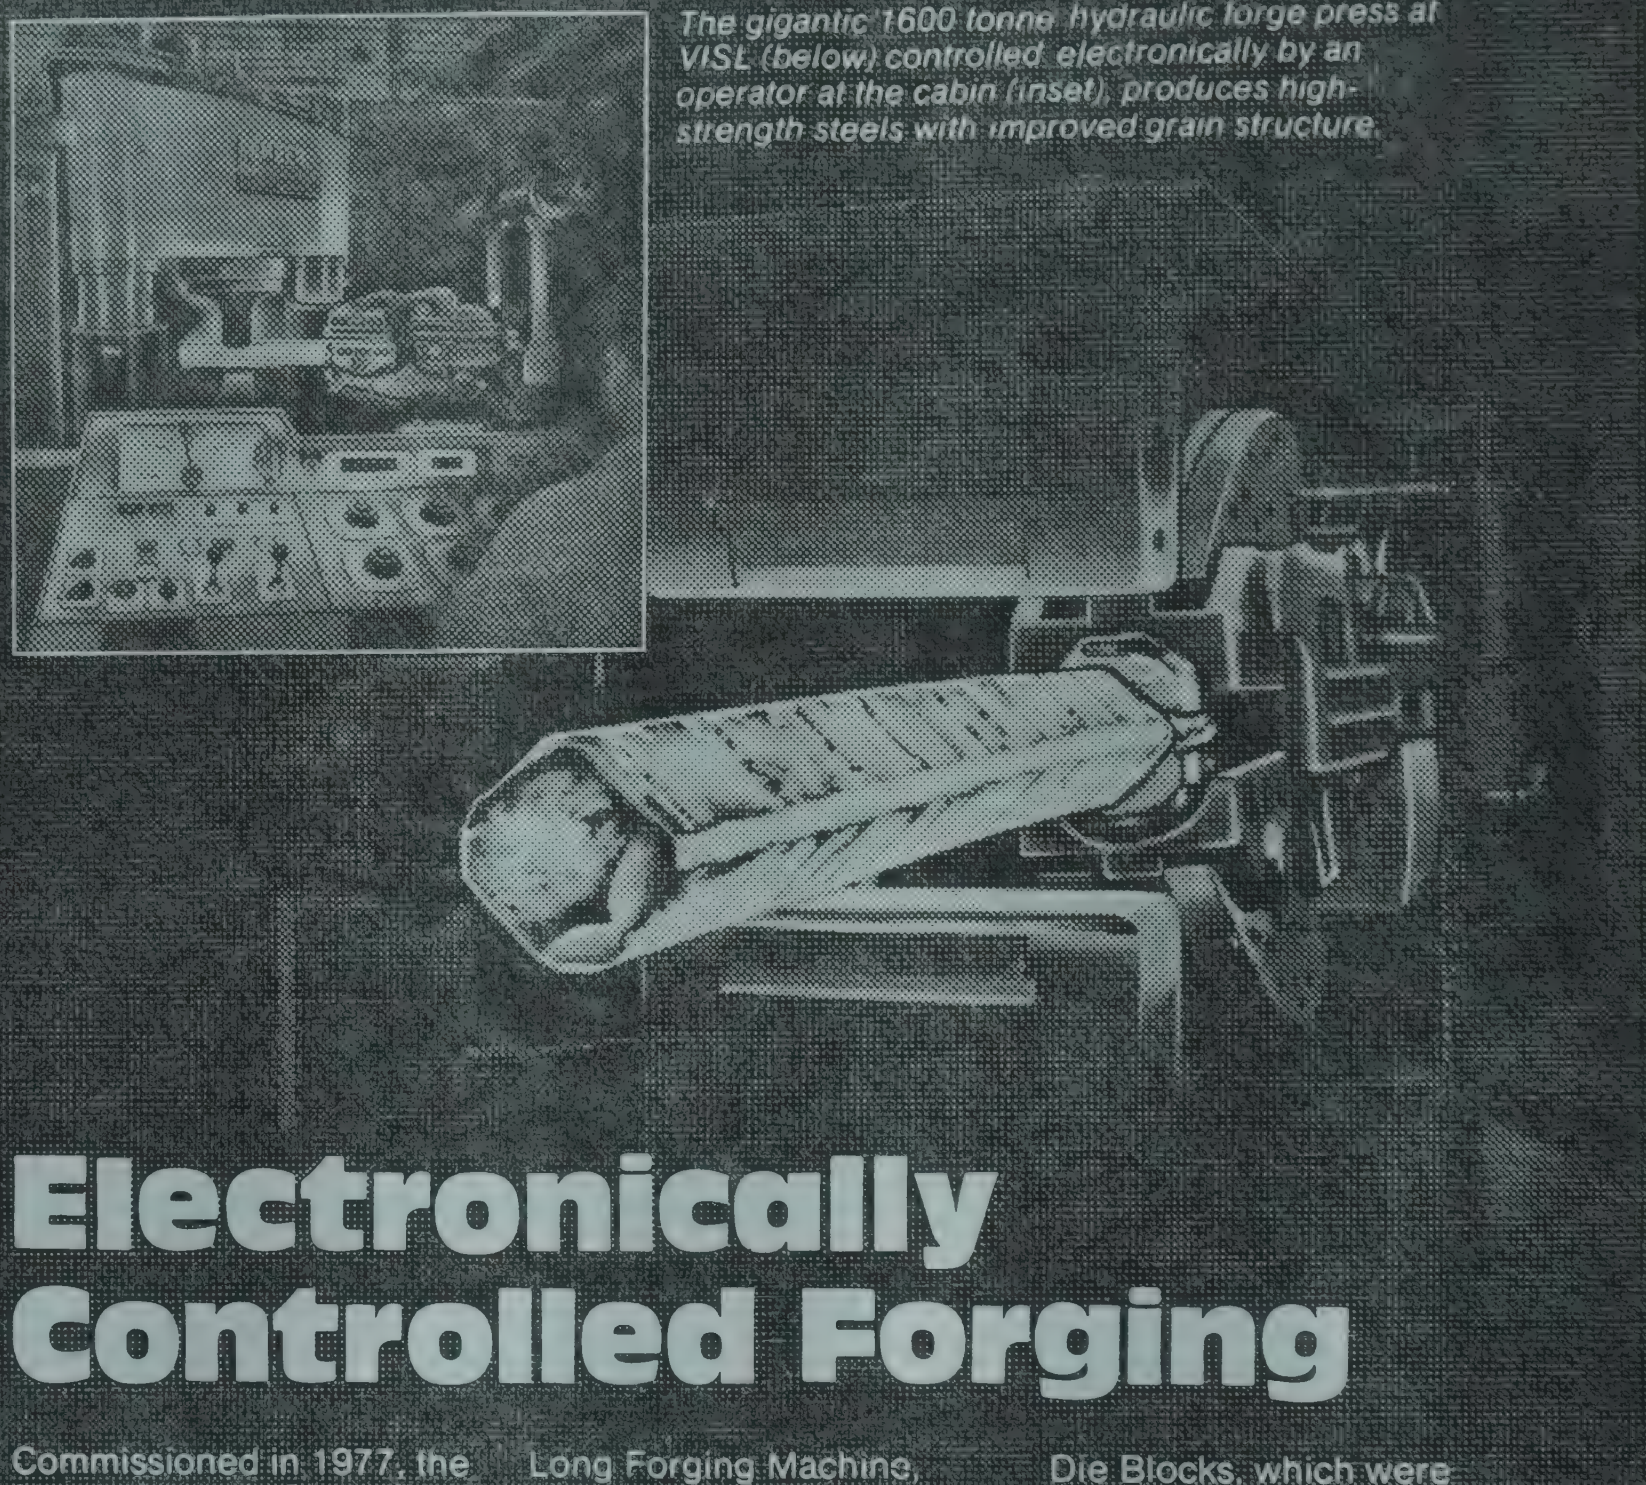
While the current pause lasts, the developing half of the world, especially the steel producing countries, should take advantage of idle capacity in steelmaking equipment plants, to get their plant and machinery on favourable terms, and where they lack money of their own as in the case of India, by liberal borrowing from the international capital market. The only rider is that once a decision has been taken on setting up plants with external commercial borrowing such as will be the case with Paradeep when the project goes through, a timebound programme of construction should be followed as strictly as it was in the case of the Kudremukh projec , so that the interest burden is kept down to a minimum.

Criteria for investments in steel

Concluded from page 29

ternative DR+EF does not seem to hold out any such attraction at all. It is true that in the latter case the ubiquitous shortages in electric power needed for melting ferrous scrap or a mix of sponge iron and scrap in electric furnaces has a decisive influence on the choice. Nevertheless, planning being for the long term, it would not be realistic to assume power shortages even in the future with which one is really concerned.

There are attempts to foreclose a complete discussion of the future route mix for the country. Secondly, one also withnesses a measure of *adhocism* in deciding about not only the choice of technology, but also regarding the strategy for attaining the long-term objectives in steel. There is no other explanation for the recent decisions to set up plants on several sites involving fragmentation of aggregate required capacity and the consequent sacrifice in the attainment of the economies of scale. Thirdly, the Planning Commission and several others (*e.g.* William Johnson 1967) have shown that even under the best of circumstances steel plants to be set up outside the Bihar, Orissa, West Bengal, MP zone would suffer cost disadvantages under any arrangement for coal including imports. Port-based plants would have to be worked to Japanese levels of efficiency if they have to commercially do well. Some of these larger questions apparently have not received as much attention as they merit.



The gigantic 1600 tonne hydraulic forge press at VISL (below) controlled electronically by an operator at the cabin (inset), produces high-strength steels with improved grain structure.

Electronically Controlled Forging

Commissioned in 1977, the forge plant at VISL was the first of its kind in South East Asia. Apart from improving the performance characteristics of high grade steels, the plant facilitates forging in a wide range of sections and sizes.

The electronically controlled 1600 tonne High Speed Hydraulic Press forges bars from 150mm to 600mm diameter to close tolerances.

Specially designed for forging Tool Steels, VISL's Long Forging Machine, SXP 25, is the only one of its kind in South East Asia. A digital-control system, automatically controls complete material movement and size adjustments during forging. It handles bars of 50mm to 210mm diameter.

The VISL Forge Plant has an annual output of 8,000 tonnes of finished and semi-finished products. It has facilitated commercial production of a variety of high grade steels, including High Speed Steels and Die Blocks, which were previously imported. Write in for detailed technical literature on our range.

Energy conservation efforts in steel works

By **K. C. KHANNA**, *Chairman, SAIL.*

THE steel industry the world over is highly energy intensive in view of the following facts :

(i) the processes for making and processing of steel take place at rather elevated temperatures.

(ii) the sensible and the latent heats of output materials from the individual processes are not fully utilised in the down stream processes either due to technological or logistic constraints.

Historically the steel industry has always been energy conscious. Over the years newer processes have been introduced which are more energy efficient. The energy conservation efforts received a new major thrust with the global energy crisis triggered by the sudden spurt in the prices of petroleum fuels in 1973. In view of the rapid escalation of the petroleum fuel price ever since, the importance of the energy conservation efforts can hardly be overemphasised.

Specific energy consumption in the Indian steel plants varies in the range of 9-14 Mkcal per tonne of saleable steel. This level of specific energy consumption is much higher than that in the technologically advanced countries. The specific energy consumption per tonne of steel cannot be considered to be an effective means of comparing the real energy efficiency between steel works as this parameter depends upon quality of input materials, product mix, equipment type, production sizes, etc. However, this parameter can be used as a macro indicator for energy conservation efforts. A detailed analysis of the energy flow, energy consumption for individual processes and identification of parameters influencing the energy consumption pattern is necessary for a better insight into the problem. Let us take an overview of the energy consumption pattern in the steel plants in India and the efforts being made for energy conservation. Some specific cases where these efforts have already yielded significant results are also mentioned briefly.

Energy consumption pattern

The main energy inputs to the steel plants for the year 1980-81 are given in Table-I. These include coking coal for production of coke, non-coking coal for use in the boilers, electricity and petroleum fuels. It may be noted that contribution of different energy inputs to the integrated steel plants is as follows :

Coking coal	— 70 — 85 %
Petroleum fuel	— 2 — 7 %
Electricity	— 1 — 3 %
Non-coking coal	— 10 — 25 %

A major part of the fuel needs of the steel plants is met from the inplant generated by-product fuels, *viz.* coke oven gas, blast furnace gas and coal tar fuels. The fuel deficit, if any, is met by using purchased petroleum fuels furnace oil/LSHS.

It is also worth noting that 64-72 per cent of the total energy is consumed up to the ironmaking stage itself. The remaining energy is used in the steel making, rolling and finishing operations as may be seen from the data given below :

Operation	*Percentage energy consumption per tonne*
Ironmaking	64 — 72
Steelmaking	10 — 26
Primary rolling	4 — 11
Finishing mill	4 — 20

High percentage of energy usage up to the iron making stage is contributed by high coke rates in blast furnace operation. Coke rate in Indian steel plants varies from 700-1,000 kg per tonne of hot metal. In contrast to this, typical corresponding figure of Japan is about 430 kg. Quality of our input materials is mainly responsible for high coke rates in our plants. Ash content of our coke is as high as 30 per cent as against below 15 per cent in Japan and other countries Another major contributing factor is adverse alumina to silica ratio in our iron ores.

Approach for energy conservation

It is clear that a two pronged approach is required for energy conservation in the steel plants, *viz.*

(i) lowering of coke rates in blast furnace by better preparation of burden charge, use of higher percentage of sinter in the burden or use of sinter with higher basicity, introduction of optimum slag regime, use of higher blast temperature 1,000 to 1,100°C, introduction of high top pressure operation, improved instrumentation and control system as well as appropriate indigenous technologies for obviating specific raw material constraints under Indian conditions.

(ii) efficient fuel and energy utilisation by

- — minimising losses during handling and storage of fuels
- — improved fuel combustion
- — minimising heat losses from furnaces by better insulation
- — development of optimum thermal regime for different furnaces
- — minimising energy losses by prevention of leaks *etc* in the pipeline carrying hot fluids like steam
- — better waste heat recovery
- — better co-ordination between shops to reduce unnecessary energy losses
- — better energy management of shops with the aid of modern instruments and micro-processor based control systems.

Keeping the above basic approaches in view we are preparing detailed action plants shop-wise for energy conservation for each steel plant. This is being done in a co-ordinated manner by the concerned operation department, Energy & Economy department and our R & D Centre. Model detailed action plans for a few shops have already been prepared. These plans clearly spell out the targets to be achieved by 1981-82, by 1985-86 and by 1989-90. Specific steps required to be taken for achieving these targets have also been worked out. Thus a comprehensive *corporate energy conservation plan* is being evolved for the present decade aimed at elimination of petroleum fuel usage in the steel plants and conservation of coking coal.

A number of specific projects have been taken up in our steel plants with a view to conserve energy. Some of the projects have been completed with significant benefits while others are in progress. Brief details about some of these projects are discussed below.

(A) Lowering of coke rates in blast furnace

Our efforts in this area are directed towards tackling the quality problems of the input materials to the blast furnace, intensification of the blast furnace process through various means, development of novel technology and use of auxiliary fuels.

(a) *Selective removal of alumina from iron ores*

For this purpose a special additive developed by Regional Research Laboratory, Jorhat, is being tested on commercial scale. Initial results have been encouraging. Sustained trials are now in progress in 600 tonnes per hour iron ore washing system at Barsua iron ore mines of Rourkela steel plant. Selective removal of alumina from iron ores will result in lower slag rate and coke rate in blast furnace operation.

(b) *Process intensification*

Blast furnace intensification can be achieved, among other things, by use of increased percentage of sinter in the charge or use of burden with high basicity for elimination of raw limestone in burden, higher blast temperature, and development of optimum slag regime. Following projects are being pursued.

(i) Percentage sinter usage in our blast furnaces is generally low ranging from 0-50 per cent. Increase in the use of sinter preferably with higher basicity can be achieved by ensuring smooth running of the sintering machines and by providing additional sinter production capacity. Alternative approach can be to use higher basicity sinter in order to eliminate raw flux input in the charge, even if sinter rate is low. We have been successful in reducing coke rate in one blast furnace at Bhilai Steel Plant by elimination of raw limestone in burden even at 55 per cent sinter rate using a sinter of basicity about 3.

(ii) Blast temperature in Indian blast furnaces range from 600 to 900°C. In our steel plants increase in blast temperatures to a level of about 1,000°C is considered necessary primarily for reduction in coke rate. For obtaining higher blast temperature certain modifications in the checker design of the stoves have to be made. The quality of blow pipes also has to be improved. At Bhilai Steel Plant necessary modifications are being made to increase the blast temperature to about 1,100°C for blast furnace No. 2 in connection with the coal dust injection programme.

(iii) Slag composition optimisation is essential for smooth functioning of the blast furnaces and thereby increase productivity and reduce coke rate. High MgO slag practice has now been accepted as the standard practice for the Indian conditions and is being practised.

(c) *Lime dust injection*

The idea of injection of lime dust through the tuyeres was conceived by our R & D Centre. It has been successfully developed and tested in 100-tonne per day blast furnace in Kalinga Iron Works, Barbil. The basic idea is to provide lime in highly reactive stage at the location where ash of the coke which is acidic in nature is released. About 7 per cent increase in productivity with corresponding decrease in carbon rate has been achieved at Barbil. It is now planned to undertake scaled up trials in one blast furnace at Durgapur Steel Plant.

(d) *Injection of auxiliary fuels in blast furnaces*

In advanced countries injection of oil in the tuyeres region of the blast furnace has been established. In the Indian context, non-coking coal injection developed in Soviet Union as well as USA is more relevant. Coal dust injection facilities are being provided in one of the blast furnaces at Bhilai Steel Plant on an experimental basis. The system being provided will be capable of injecting up to 133 kg of coal dust per tonne of hot metal thereby reducing coke rate by 150 kg per tonne of hot metal.

(B) Efficient utilisation of fuel and energy

In this area our efforts aim at reduction of fuel consumption rates per tonne of the throughput for different furnaces like OH furnaces for steel making, soaking pits and reheating furnaces. While significant results have been achieved in OH furnaces and soaking pits, work in reheating furnaces area has just been initiated

i) *Open hearth furnaces*

A project on development of optimum thermal and oxygen regime of OH steel making in Bhilai Steel Plant is in progress. After extensive trials a modified thermal and oxygen regime has been identified which shows a potential of very significant reduction in specific fuel consumption (15 per cent to 20 per cent). Further trials with the modified regime are under progress. A similar projects is being taken up in the Durgapur Steel Plant.

Table I : Energy inputs to steel plants in 1980-81

Steel Plants	Coking Coal	Non-coking Coal	Purchased Electricity	Fce oil/ LSHS	Naphtha
	Million tonnes	Million tonnes	10^6 MWH	Kilo litres	Kilo litres
Bhilai	2.99	0.39	0.42		20,000
Rourkela	1.85	0.21	0.50	1,06.000	0
Durgapur	1.57	0.20	0.22	72.000	0
Bokaro	2.50	0.63	0.40	10.000	0
Indian Iron	1.47	0.43	0.10	17.000	0
Tata Iron	2.21	0.86	—	1,09,000	0
Total	12.59	2.72	1.64	3,14.000	20,000

ii) *Soaking pits*

Oxygen enrichment of combustion air was initially tried in one soaking pit at Rourkela Steel Plant. The results showed about 15 per cent decrease in heating time and about 10 per cent decrease in specific fuel consumption for cold ingot charge. Encouraged by the results, oxygen enrichment facilities have been extended to six soaking pits.

Recently similar trials were carried out in Durgapur Steel Plant which showed a reduction of about two hours in the total heating time along with about 15 per cent reduction in specific fuel consumption for cold ingot charge. It is now planned to extend oxygen enrichment facilities to other pits.

A comprehensive project is in progress at the Bhilai Steel Plant which is aimed at 15 per cent to 20 per cent increase in productivity of soaking pits for cold ingot charge thereby improving fuel efficiency. Certain specific modifications in the soaking pit design and operation have been tried with initial positive results as per expectations. Further trials are being carried out before introducing similar modifications in other soaking pits.

iii) *Improvement in combustion systems*

The burners presently used in the steel plant furnaces are of rather vintage era. To make use of the latest developments in combustion technology we are setting up experimental furnace facilities within the premises of one of our steel plants. This facility will be used for characterisation of burner systems presently used and for defining improvements in the design and operational parameters of the combustion systems.

To sum up it may be mentioned here that *SAIL* is fully conscious of the urgent need for sustained energy conservation efforts in the steel industry. To ensure quick realisation of the benefits a systematic approach has been adopted wherein all concerned engineers from operation departments, Energy & Economy departments and R & D Centre are working together on implementation of clearly defined action plans for energy conservation. Some of the projects have shown significant benefits while many others are in progress. We have a long way to go. There is no short cut to energy conservation other than relentless and pointed efforts in individually identified energy consuming operations/centres/processes. We would continue to move in this direction. Success is well within our reach.

Role of mini steel plants in next decade

By **UMESH KUMAR MODI**

Mr U. K. Modi

THE demand for steel by the year 1988-89 is expected to grow up to 17 million tonnes from about 12 million tonnes from 1983-84. The categories of products which mini steel plants can manufacture in respect of the demand will go up to 8.5 million tonnes. The growth of demand for the bars, rods and light sections will therefore be 2.65 million tonnes for 1983-84. The strategy for meeting this extra demand could be as follows:

(a) Obtaining increased output from existing integrated steel plants by fuller utilisation and by putting up new integrated steel plants to keep with the increasing demand.

(b) Obtaining either the bulk or whole of the demand from mini steel sector (based on sponge iron route).

Advantages

In this context, I would like to highlight the advantages of setting up new mini steel plants against new integrated steel plants.

(a) Today the investment costs of an integrated steel plant will work out to Rs 15,000 per tonne of ingot. This has been amply proved by the cost estimates for integrated steel plant of 1.5 million tonnes capacity to be located at the Paradip port.

As against this, the investment cost per tonne of a mini steel plant with a capacity of one lakh tonnes routed through sponge iron unit, electric arc furnaces, concast unit and rolling mill will be around Rs 5,000 per tonne. The total investment for such a plant will not be above Rs 50 crores (an investment of Rs 28 crores will be for sponge iron unit and Rs 22 crores will be for steel unit). Thus, if the alternative of putting up mini steel plant is adopted then a saving of about Rs 1,000 per tonne in the investment cost can be envisaged and this being so, the total saving on a production of 2.65 million tonnes will be Rs 2,650 crores.

Over and above the higher investment cost per tonne in case of an integrated steel plant, resulting in an increased cost of production, it also gives rise to problems of financing. Even in a small country blessed with rich natural mineral resources, the investment in an economic size integrated steel plant would swallow a significant portion of gross capital formation. The example of Paradip plant mentioned above too indicates the same and the nation may have to set aside huge sum annually to complete putting up of such plants. Moreover to organise the infrastructural facilities for such tonnage steel plants based on iron ore put a severe strain on the resources of the nation.

(b) The technology of integrated steel plants using non-coking coal is still not established and we will have to rely on large scale import of coking coal.

(c) Lower gestation period.

(d) Ability to satisfy the regional demands by putting up plants at the consuming centres and thereby eliminating the problems involved in the movement of materials.

(e) Ability to give short deliveries and change in the product mix if required.

(f) Ability to expand melting facility if the market requirements so demand.

As against the above advantages, following are the disadvantages which, in my opinion, are not so considerable compared with advantages so far explained.

1. Higher cost of production of mini steel products in comparison with integrated steel plants.

2. Requirement of larger quantities of power when the country is already facing acute shortage.

Number of hurdles

The mini steel plants currently face a number of hurdles and, as a result, their production has been more or less stagnant for the last three years at around 1.8 million tonnes as against a capacity of 3.42 million tonnes. The problems need to be looked into carefully by the authorities as the country cannot afford to have the luxury of idle capacity.

Power continues to be the most irritant factor in the Indian industry. The power situation, it is officially claimed, has shown an improvement but industry continues to have a shortage of it. The inefficient operations and the management of power plants has come to be an accepted way of life. But this is crippling the Indian industry not only at present but also in the years to come. I hope that the Central Government and the State Electricity Boards will pay utmost attention to improve the efficiency of power plants. This industrial sector (power generation), as I have said on an earlier occasion, should be given to those organisations who can run it efficiently whether they belong to public sector, joint sector or private sector. Today every industrialist, worker or trader or farmer, only asks this question : what is the Government doing to improve the power generation which affects every one's life in one way or the other?

Mr Modi is managing director, Modi Steels.

The effect of the power cut on the mini steel plants is much more than in many other industries because of the differentials in power cuts. The power cut on regular industry is much less than in mini steel plants. If this kind of situation continues the mini steel plants cannot flourish.

In this regard, I would also like to put up a proposal that in the above circumstances the government should encourage captive power plants by the mini steel industry. It is only possible if the following concessions are given to the mini steel industry.

1. A debt equity ratio of 4:1
2. Soft loan facility
3. A minimum of 10 per cent subsidy

Shortage of scrap

Another most important factor responsible for less production is the acute shortage of scrap. In our country the scrap availability is only around 1.6 to 1.65 million tonnes as against a total capacity required of 3.4 million tonnes. The only alternative today is to turn to imports. The scrap is available from three main sources, namely, (1) USA, (2) Middle East and (3) Sponge Iron.

Today because of the recession in the US economy the prices of scrap have come down to a level which can prove economical for use by electric arc furnaces in India because the demand at present in this country is very high. But the scrap imports have not touched required expected levels. For example scrap imports in 1979-80 were 98,000 tonnes. In 1980-81, out of the total imports of 97,000 expected, in the period April-December 1980, direct imports are 72,175 tonnes and imports through MSTC will be about 24,853 tonnes. Larger imports did not materialise for the following reasons.

MSTC is the canalising agency for scrap imports. Although the commission payable to MSTC has recently been reduced from four per cent to 2½ per cent, still the procedure of importing through the canalising agency has resulted in inordinate delays and thus the quantity coming is very less. In comparison to this about 15 companies which have been allowed to import freely have given a very good account of themselves. This year it is expected that they will be able to import 1,00,000 tonnes compared to only 60,000 tonnes by MSTC which has been the canalising agency for the rest of the 130 units. Therefore, once again I would like to reiterate that scrap import should be only on OGL.

Scrap from Middle East

Last September, Government took a decision to have a trial import of scrap from Middle East through MSTC. We are happy to note that the MSTC had sent a delegation to the Middle East for the survey of the scrap available there and for the import of some of the scrap on a trial basis. It is indeed a matter of gratification to note that a contract has been finalised for the import of 12,000 tonnes of scrap.

I feel that the Middle East is certainly advantageous because of the following reasons:

(a) Availability in the Middle East: The scrap from the Middle East can be imported in smaller lots of 3,000 to 5,000 tonnes by individual buyers eliminating the difficulties involved in clubbing together the requirements of scrap, shipment handling, etc.

(b) Lower prices: The scrap available in the Middle East is much cheaper than the scrap available from Delhi sources because of the differences in freight. Anyhow this import will demonstrate beyond doubt the economics of using this material and thereafter immediate steps have to be taken to import large quantities and I sincerely hope MSTC will take early steps to import at least one lakh tonnes of scrap from this source.

Sponge iron

Sponge iron has already started coming from Indonesia. The trial quantity of 30,000 tonnes has already arrived and distributed to the members. The results of the sponge iron used have proved quite encouraging. Earlier this year I had been to Indonesia as a member of the delegation to finalise the price at which fresh contracts could be entered for the import of sponge iron. After a series of negotiations it was possible to successfully finalise a deal for a quantity of four to five lakh tonnes to be imported.

Having mentioned much about the important raw material like scrap and the need of import of scrap and sponge iron, I would like to dwell on the need for making available sponge iron indigenously and express the views of the industry in general on the subject.

As all of us are aware, the demonstration plant with the capacity of 100 tonnes per day has gone in production at Kothagudam with LURGI technology. The initial reports from the plant are good. It is also understood that this plant has achieved in short time the full capacity per day and the metallisation is 92 per cent. I personally think it is an important break through and if the results will continue to be so good in the long run, the face of mini steel industry would undergo a drastic change in years to come.

Another sponge iron plant in collaboration with Messrs Allis Chalmers Corporation of USA has been put up at Tangreni in Orissa with a capacity of 1,65,000 million tonnes per year and is expected to come into production by September 1981. Every one in the industry is anxiously looking forward also for its successful production and the results.

India with its rich reserves of iron ore, non-coking coal and limestone is the most appropriate country for putting up sponge iron producing units. As stated earlier, the installed capacity of mini steel plants is about 3.4 million tonnes whereas the scrap available in the country is sufficient only for the production of 1.8 million tonnes, leaving a gap 1.6 million tonnes of scrap.

Sponge iron is the only alternative to scrap and, therefore, by 1985 we should plan for putting up a capacity of at least one million tonnes of sponge iron. This capacity can be created only by allowing the private sector to come forward and set up sponge iron units by following a pragmatic policy. This industry should be thrown open to the private sector without restriction and given priority as in the case of cement industry.

Diversion

The crusade which was taken by the Ministry of Steel and Mines to initiate the conversion of more and more mini steel plants from mild steel to special and alloy steels has shown some progress although the progress has been slow.

Many of the units which were previously engaged in the production of mild steel and plain carbon steel has started diversifying into the following grades of special and alloy steels.

(a) Spring steel

(b) Forging quality steel up to 63 mm RCS

(c) File Steel

(d) Plain carbon special steel.

But there is considerable scope for the import of the following grades of steel in large quantities.

(a) Wire rods/bars for cold heading purpose

(b) High carbon wire rods for special wires like textile quality, spring steel, tyre bead, etc.

(c) Leaded free cutting steel flats and sections

(d) High sulphur free cutting bars and rods

(e) Wire rods of carbon above 0.85 per cent.

The inability of mini steel plants in achieving the increased production targets of the above grades of steel is not because of their technical incompetency, but because the production of these steels is uneconomical. Mini Steel plants are in a position to produce indigenously these steels only because of higher costs of production but are unable to compete with the foreign suppliers only because of the higher cost of production. This high cost of production is attributed especially to the high price of the following items :—

1. Scrap
2. Power
3. Electrodes
4. Refractors
5. Ferro alloys
6. Furnace oil
7. High cost of working capital
8. Low tonnage requirement of various grades and sizes

The ever increasing cost of the above, is making operations of mini steel plants more uneconomical and the mini steel plants cannot compete with foreign supplies because their cost of production is much lower. This, at the first instance, has given a slow pace to the scheme of diversification into these special and alloy steels and save valuable foreign exchange of the country. I suggest that a high power committee consisting of the Joint Secretary and the Industrial Advisor to the Iron and Steel Controller may go into the ways and means of finding the scope for giving enough incentives or protection to the mini steel plants to produce the same.

I suggest that it should be the efforts of all concerned to fill the gap between demand availability of special and alloy steels by more mini steel plants going for diversification into special and alloy steels through continuous casting route. We are very thankful to the Ministry for recognising the future of mini steel plants through continuous casting as in the case of Europe and USA. We are also particularly thankful for allowing the mini steel plants to set up continuous casting installations. But in India the mini steel plants which are having a continuous casting facilities are only engaged in manufacturing of plain carbon steels rods. The continuous casting route has the following advantages over the conventional ingot route.

(a) Low investment cost

(b) Higher yield by about 10 per cent

(c) Lower cost of production

Thus, if this technology is developed today, the existing alloy steel plants which are utilising their existing capacity to manufacture lower sections of special and alloy steels through cogging and forging process can utilise it to make larger sections, while lower sections could be produced by the continuous casting process. For this purpose, it is essential that the Government allows free import of advanced technology from abroad.

After undertaking an elaborate study of the various advantages of continuous casting, policies can be formulated for encouraging the mini steel plants to convert their production into alloy and special steel grades.

BOKARO STEEL NEWS
(Steel Authority of India Limited)

Bokaro Steel workers save Rs 1 crore through Co-op Credit Societies

In the three years that the Bokaro Steel Employees Co-operative Credit Societies have been in operation, they have shown phenomenal and multi-dimensional growth.

One of their major objectives is to provide credit to workers. The Societies have already loaned out Rs 5 crores. Recovery of loans has also been excellent since they are deducted from salaries.

The Societies have also helped to promote the personal savings habit. Through these Societies alone, Bokaro workers have saved over Rs 1 crore! With compulsory savings of Rs 6 lakhs every month, Rs 75 lakhs are being added to the working capital every year. The Societies have also proved to be extremely profitable. They have regularly declared 10% dividend, the maximum allowed by the Bihar Government, to their members.

These Societies are making a visible impact on the lives of workers. Today, workers have money they can call their own. Money in the bank. Money for an emergency. Money for the future. This is why one no longer sees the familiar figure of the moneylender at Bokaro's plant gates.

More than a steel plant—
a home for 40,000 people

Bokaro Steel has brought about tremendous socio-economic changes in its environment. Struggling villages have given way to a planned city. Parks, schools, medical facilities and shopping centres have transformed lifestyles. Through its welfare activities, Bokaro Steel is enriching its people's lives.

An example to all other co-operatives

These Societies are indeed models of how a co-operative should be run. All of them have nominated representatives of the Plant as Secretaries and Chairman. The operating procedures leave no room for malpractices. Loans are processed on a 'first come, first served' basis. Honorary auditors make regular checks.

A record of sound financial performance

Number of Societies
11 (10 at Bokaro Steel City, 1 at Calcutta)

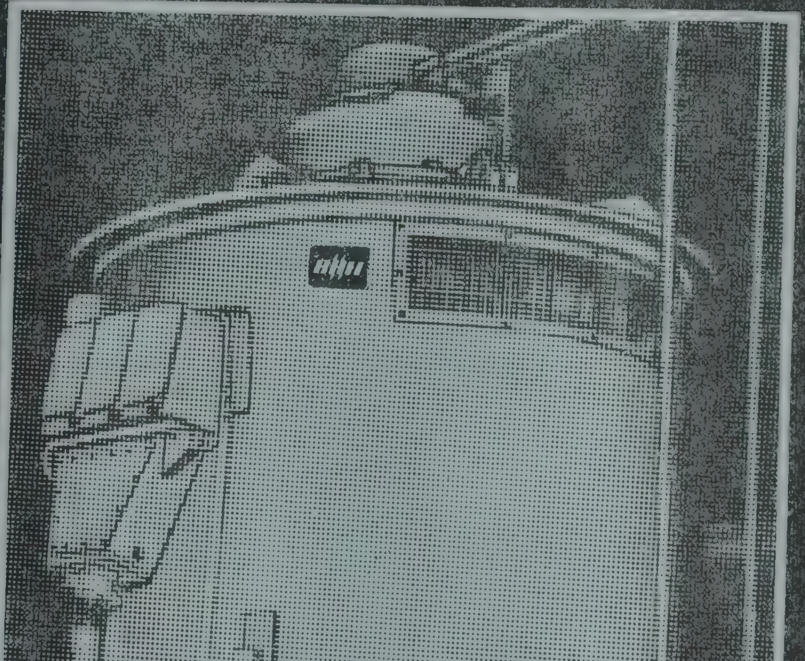
BHEL scores a hat trick

Korba

Singrauli

Ramagundam



supplying Vertical CW Pump Motors for all three super thermal power stations in India

In the face of stiff global competition, BHEL secured successive orders for the Singrauli, Korba and Ramagundam Super Thermal Power Stations.

- 13 Nos. 1800KW, 500RPM, SP/DP Motors for Singrauli
- 14 Nos. 685/1025 KW, 500 RPM, SP/DP Motors for Korba
- 7 Nos. 1325 KW, 500 RPM, SP/DP Motors for Ramagundam.

Earlier BHEL had already supplied 13 Nos. 1500 KW Vertical Motors to Bhusawal & Kudremukh Projects and dozens of other Vertical Motors to various power stations.

Technical Features:

- Tailor made to suit specific requirements and conforming to IS 325/BS 2613.
- Fitted with pad type thrust and guide bearings (Angular contact or spherical roller bearings could also be provided).
- Class 'F' insulated.
- Available in SP/DP, CACW & CACA Enclosures.

BHEL's Motor manufacturing Divisions at Bhopal, Hardwar & Hyderabad have already supplied about 20,000 Nos. of AC & DC Motors for various applications and these include 2 Nos. 12500 KW horizontal motors for Bhilai Steel Plant, 2 Nos. 9000 KW motors for BALCO & 4000 KW Boiler Feed Pump Motors for various power stations.

BHEL more than products, a total service for energy

CAS-318

Criteria for investments in steel

By S. V. CHAR

THE Sixth Five-Year Plan has envisaged a steel ingot (crude) capacity of about 18 million tonnes for 1984-85. This is as against the existing capacity of the order of 14.67 mt including around 4 mt in ministeel units. Thus, over the plan period there would be an increase of about 23 per cent. Practically, the entire expansion in capacity and in production has been planned to be obtained in the integrated plant segment of the steel industry. A marginal expansion of the order of 1,70,000 tonnes has been projected for ministeel units. In other words, the present freeze of ministeel capacity would continue unless, of course, the government contemplates a mid-course correction. This is possible only if the supply position in regard to critical input items such as electric power, ferrous scrap, graphite electrodes and refractories becomes much less difficult than at present.

In view of the heavy capital deepening as well as the long gestation periods involved in the iron and steel industry, investments have to fulfil certain vital criteria and decisions for promoting its development have to be taken on the basis of perspective plans covering normally a 10-15 year period if not longer. For the same reasons, its growth is sometimes envisaged in an autonomous manner without drawing much of a sustenance and relevance from the quinquennial national plans. Thus, the White Paper on the Steel Industry (1976) had mentioned a tentative target capacity of 75 mt by 2000 AD. Other projections have placed the required crude steel production at about 25 million tonnes by 1988.

The highlights of the strategy to achieve the Sixth Plan targets are: removal of infrastructural constraints, setting up captive power plants, undertaking R&D activities in a more intensive manner, implementation of expansion, modernisation and replacement programmes as well as creation of new capacity at Vizag and elsewhere.

Conspicuous lacuna

A conspicuous lacuna in the discussions regarding development of the iron and steel industry in India relates to the selection of relevant technology. Basically there are two iron and steelmaking processes : one is the conventional coke metallurgy route employing the Blast Furnace + Linz Donowitz converters or BF+LD. More recently, in the place of LD converters Q–BOP (Quick Quality, Quantity–Bottom Blowing Oxygen Process) is being employed. The BF+LD or BF + Q–BOP route calls for lumpy investments in coke oven battery complex and other indivisibilities such as BFs, steelmaking shops, post ingot facilities, auxiliary workshops, power systems and townships.

The second route, which in relative terms is not so conventional is the Direct Reduction + Electric Furnace (DR+EF) route. While this route can do without coking coal which is a scarce item, nevertheless it is a power-intensive operation. Capital costs per tonne of capacity created on a greenfield site would be far less than under the BF+LD route. Our computations show that it would be even slightly less than the costs per tonne of capacity created on a BF+LD brownfield site through expansion. Where DR of iron-ore into sponge iron is based on a solid reductant such as ordinary coal or even lignite, there are no resource constraints as when such DR process is natural gas-based. Unless natural gas allocations are forthcoming in adequate volumes and the price of gas so allocated is also, calorie for calorie, as attractive as that of coal, the DR+LD holds out no attraction. Synthetic gas manufacture through coal gasification is definitely possible, but the major hitch here is the technological immaturity of the processes for making synthetic gas on a commercial scale. Together with the technological infancy of DR processes themselves, particularly in India, synthetic gas-based DR+EF would pose too formidable a challenge to be accepted readily without adequate R&D support.

It is true that one cannot ignore the several variations of the iron and steel processes. For instance, for making iron, besides the BF and DR there are also smelting furnaces such as the Tyesland Hole or Elkem furnaces which can be vertically integrated with an LD converter such as at the Chandrapur plant of Maharashtra Electrosmelt Limited. For steelmaking besides the LD and Q–BOP, there are processes such as open hearth, twin hearth, LD-AC, Rotar, Kaldo, etc. However, we may choose to concentrate on the two basic routes, *viz* BF+LD and DR+EF.

At present, several sites for new steel plants have already been selected or likely to be selected. Some of them are coast-based such as Vizag where the construction work has already commenced and Paradip, Mangalore, Goa and others. The other sites mentioned are Vijaynagar (Hospet), Nayagarh, Surajgarh, Bailadila, etc. Steel industries from other countries such as Demag of Germany, British Steel and Davy of UK, Sacilor of France, Italsider of Italy, Nippon of Japan and also state organisations in USSR are evincing interest in forging collaboration for establishing new capacity whether by way of expansion of existing units or on greenfield sites mentioned earlier.

Cost-benefit analysis

Albeit the basic and strategic importance of the steel industry to the economy, the massive investments that it entails now for benefits to accrue about a decade hereafter calls for a thorough cost-benefit analysis of such investments. Such a CB study would have to invariably reckon with the opportunity cost of such funds with reference to the unemployment problem. As a matter of fact, such investments in the capital-intensive steel industry hardly make a dent on the unemployment problem of even just one district in which the steel plant is to be located. This is because each unit employs directly at the most 50,000 to 60,000 people.

Assuming the overall costs of a hypothetical unit to be about Rs 3,000 crores, an investment of over Rs 6 lakhs would have to be made just to employ one person, whereas there are several well thought-out schemes for providing gainful employment to about 50 persons with the same investment. Secondly, considering the long gestation periods for the steel industry which are further lengthened on account of one or the other hitch which invariably crops up, such as shortage of finance in particular, pouring large sums into the erection of steel capacity is somewhat like Max Gammon's black holes into which public expenditure disappears with not an ounce of product emerging therefrom for a long period. The inflationary nature of such expenditure cannot be ignored.

Leaving aside such a basic issue, one often witnesses a cynical rejection of valid criteria which should govern the setting up of integrated steel plants such as external economies in the nature

THE
METAL
OF THIS
CENTURY

Although aluminium was first isolated in the year 1825, it was only after the turn of the century that it found much usage. Today however aluminium is indispensable and it cannot be separated from the contemporary industrial progress.

BHARATAL products continue to win wide acclaim for excellent quality from a variety of industrial users : from Aircraft and sophisticated electronics to household and from agricultural equipment to power sector.

Bharat Aluminium Company's works at Korba is producing a variety of products —
★ Electrical and Commercial Grade Aluminium Ingots
★ Properzi Rods
★ Billets
★ Alloy Ingots and Extruded Sections.
Soon it will commence marketing rolled products as well. Other products in the range are —
★ Alumina Hydrate
★ Calcined Alumina
★ Carbon Electrode Paste and
★ Vanadium Sludge

Newfields

of proximity to raw materials which are of a weight-losing nature, ease in marketing (freight costs should not be high relative to the value of steel), adequate resource support and so forth. Not infrequently politicians dally with populism. The state governments also romanticise their claims for an integrated steel plant. Consequently, there has been some permissiveness in decision-making about location of new steel units. It is, therefore, no wonder that feasibility reports do show that some of the proposed plants would not be harbingers of prosperity, but would only serve to be status symbols, white elephants or even eyesores.

Cost of delay

A classic example relates to the manner in which it was decided to establish the steel plant at Visakhapatnam. It was in the mid-sixties that the agitation with the slogan *'Visaka Ukku, Andhra Hakku'* (meaning Vizag steel is Andhra's birthright) was launched. The foundation stone was laid in 1971 to coincide with the general elections. However, the decision to commission a detailed project had to wait till October 1973. Dastur & Co submitted the report in 1977 just at the time the Janata Government came to power. Further delays were there in arriving at an agreement with Soviet authorities. After a long period of incubation, a tight commissioning schedule has now been drawn up according to which the foundation work for the Vizag plant will commence in October 1981 and the plant would be ready for operations by October 1985. Thus, it has taken over 11 years after decision was taken to commission the construction operations. The cost of delay about which much has been said in these columns has been of a back-breaking nature.

A number of strong points has been associated with the Vizag plant. It being a coast-based plant, it would be convenient to import raw materials, in particular, coking coal which need not have to be transported over any land route at a sizeable freight cost. Similarly, finished products especially pig iron earmarked for exports need not have to be moved over any land route. It has been claimed that individual pieces of equipment would be of a large size enabling achievement of scale economies. Continuous casting facilities for blooms and billets would be employed effecting savings in energy as well as in labour costs.

More recently, the Steel Authority of India Limited has finally cleared the Vijaynagar steel project and forwarded its recommendation to the Ministry of Steel, for due approval. Thereafter, the public investments board on which members of the Planning Commission, Steel Ministry, Finance Ministry and the SAIL itself have been represented would have to give consent to the proposal before it is placed before the Cabinet for the final imprimatur.

Minimum size

It is in this setting that one would have to consider the economic viability of future steel plants with particular reference to certain techno-economic criteria. In the first place our studies as well as by others have established the fact that the minimum efficient size for an integrated steel plant anywhere in the world including in India cannot be less than six million tonnes of raw steel. Only then it would be possible to attain about 90-95 per cent of the available scale dependent internal economies, especially those termed as engineering or technical economies. Capital and revenue cost savings are mainly on account of indivisibilities and area-volume relationships. Even for a reasonably economic size plant for achieving about 85 per cent of the scale economies, a minimum capacity of 5 million tonnes is called for. As against this techno-economic standard, the proposed size of the Vizag plant is only 3.2 million tonnes, even after the completion of the second phase. Similarly, in the case of the Vijaynagar plant, almost the same capacity size is being contemplated. There are, thus, enough examples to show that scale economies are being sacrificed.

It is true, however, that more recently the strategy for creation of steel capacity relies to some extent on expansion of existing units. Hopefully, this would raise the capacity in individual steel plants to around 5 million tonnes such as in the case of the Bokaro steel plant which is expected to reach capacity of 4.75 million tonnes by 1986-87. By and large, however, the pernicious practice of building steel plants in stages and over-dimensioning them with a view to cheapen future expansion persists. In other countries particularly in Japan, the plants are designed for a desired rated capacity and facilities in all the production departments are installed simultaneously so that when the plant is commissioned, the entire unit runs to full capacity with no idling of equipment whatsoever. This is very much unlike in India where overdimensioned facilities involving large investments remain idle for several years.

Economic viability

Yet another major issue relates to the economic viability of new units to be set up along the coast or in the interior. For a hypothetical plant the capital cost per tonne of capacity created is likely to be about Rs 11,000 to Rs 12,000/tonne. This would mean that the capital cost per tonne of production assuming a 20 per cent capital charge including depreciation and interest would be about Rs 2,200 to Rs 2,400 or even higher if the production of finished steel is less than 3 million tonnes. According to a recent report the capital cost per tonne of billet at Vijaynagar is likely to be as much as Rs 5,000/tonne. The present market price for rounds and bars is about Rs 4,000/tonne. Thus, the capital charges alone would work out to about 50-60 per cent of the current market prices.

For vintage steel plants capital costs may work out to about 15 per cent of the works cost comprising cost of inputs, labour and overheads only. For units such as Bhilai it may work out to about 20 per cent, whereas for the new plants Vizag or Vijaynagar it would be much higher as mentioned above. unless of course as in the case of Vijaynagar the product-mix comprises flat products such as coils, skelp and sheets for which JPC prices are in the range of about Rs 4,000 to Rs 6,000/t (f.o.r. railhead station) for tested categories.

This single factor alone raises seriout doubts about the commercial viability of the new plants, unless of course one prays for sharp escalations in iron and steel prices, which would be adequate to prevent cash loss. The very first feasibility reports actually said so. Even if one assumes such higher target prices, one cannot ignore the more basic question of the wider implications of such developments in public expenditure on the economy and distributive justice. Will the Steel Ministry, Public Investments Board and the Planning Commission undertake a thorough study into these basic criteria for investments before clearing new projects? It is a good augury that in respect of a new plant to be set up the Ministry has just now called for an assessment of the additional investments in infrastructure which appear to have been either underestimated or not reckoned with at all.

The foregoing discussion brings us back to the question of choice of technology. BF+LD alone happens to be the status symbol with all glamour despite its adverse bearing on the distributional aspects of public expenditure. The al-

Salem goes on stream

From OUR SPECIAL CORRESPONDENT

MADRAS

TAMIL NADU's long cherished dream to have a steel plant at Salem came true on September 13 when glistering stainless steel strips rolled out of the Sendzimir mill of the Rs 167-crore Salem steel plant on the occasion of the commissioning of the project's first stage. At a simple function, Mr A. S. Gill, secretary to the Department of Steel Ministry pressed a button and commissioned the Sendzimir mill, the kingpin of the cold rolling mill complex. Earlier Mr K. C. Khanna, chairman of Steel Authority of India, opened the main works entry to the plant. At the ceremony the first consignment of 950 kg of rolled sheets was despatched to a consumer.

Salem Steel Ltd in its first phase will manufacture 32,000 tonnes of stainless steel coils and sheets with thickness ranging between 0.3 millimetres and four mm and width up to 1,250 mm. Stainless steel finds numerous application, from an injection needle to an atomic reactor vessel and is resistant to rusting and corrosion.

The sixth steel plant of the Steel Authority of India (SAIL) to go into production since independence the Salem steel project's first stage which was cleared by the Government of India on March 13, 1977 has been completed and commissioned within 54 months as scheduled.

It was in 1970 that the Prime Minister, Mrs Indira Gandhi, announced in the Lok Sabha the Union Government's decision to set up three steel plants in the country at Visakhapatnam in Andhra Pradesh, Salem in Tamil Nadu and Vijayanagar in Karnataka. In 1972, based on a first feasibility report, the Government made an investment decision to establish at Salem an integrated special steels plant for the manufacture of stainless steel, electrical steel and other special steel sheets and strips. The late Mohan Kumaramangalam, the then minister for steel and mines, inaugurated the construction work at the site on June 30. However, due to several factors, including paucity of funds, little progress was made in the work. However, after the Government announced its approval of the first stage of the project to produce 32,000 tonnes of cold rolled stainless steel coils and sheets using imported hot bands, there was no let-up in the activities. The detailed project report for the project was prepared by Dastur and Company Pvt Ltd who were also entrusted with the job of project engineering. Hindustan Steel Works Construction Ltd, a public sector construction agency, performed the civil and structural work.

Salem steel plant uses a sophisticated technology of high speed cold rolling of stainless steel coils and sheets so far not adopted in India. Technical know-how for the plant is obtained from Peugeot Loire of France, the well-known automobile and steel manufacturers. The two three hundred metre long annealing and pickling lines adopting neutral electrolyte pickling process have been supplied by Dujandin Montband Somenon (DMS) of France in association with Drever International AL Belgium and Ruthner of Austria. Electrical equipment are supplied by BHEL. The 20 feet high Sendzimir Mill (ZR 22 B 52) was manufactured by Hitachi and supplied by Nissho Iwai of Japan. The coil build up line and strip grindling line have been supplied by Sundwig of West Germany and Heavy Engineering Corporation of Ranchi. The skinpass mill is supplied by Mecon, Ranchi in collaboration with Wean United of the US and was manufactured by Garden Reach Workshops at Calcutta. A number of other public sector com-

"A WIDE RANGE OF EQUIPMENT FROM HEC"

HEC—India's Largest Engineering Complex has several "FIRSTS" to its credit. It has made one of the World's largest Primary Gyratory Crushers, Stackers and Reclaimers for the National Mineral Development Corporation. For India's first indigenous steel plant—Bokaro—HEC has contributed nearly 80% of the equipment to the Blast Furnace Complex alone. HEC has also supplied aluminium Electrolysers to BALCO, Cyclotron Magnet for Bhabha Atomic Research Centre, Excavators to open cast mines of Coal India, River Valley Projects, Water Well Drilling Rigs to State Governments and a host of equipment to core sector Industries in India and abroad.

This is not the complete story of HEC's achievements. But it is sufficient evidence to show that HEC has pioneered self-reliance in Heavy Engineering.

HEAVY ENGINEERING CORPORATION LIMITED
(A Government of India Enterprise)
Ranchi-834 004.

"A NEW THRUST, A NEW DIRECTION, A NEW CONFIDENCE"

panies have been associated with the manufacture and supply of equipment valued in all Rs 87 crores.

While the present Sendzimir mills production capacity is only 32,000 tonnes per day, the Government is considering a proposal to instal another Sendzimir mill's and associated facilities at an additional investment of Rs 30 crores. This would double the capacity of the plant and improve its economics.

Presently the hot bands which are the input material for Salem steel are being imported. A scheme to manufacture by continuous casting process stainless steel slabs at the Durgapur allloy steels plant and roll them at Bokaro steel plant hot rolling mills has been approved by Government. When this is achieved considerable saving of foreign exchange will be effected. Doubts have been expressed in certain quarters that the Salem steel plant will be limited to its present scope, namely, cold rolling and may not be developed as an integrated steel complex as originally envisaged. Mr A. S. Gill has tried to allay such an apprehension by saying that, though the investment decision covered only the cold rolling complex, there were possibilities of further development though he did not categorically assure that the project would blossom into an integrated one. Mr Khanna told a news conference that SAIL had approached the Government to reduce the burden of customs duty on imported hot stainless steel band and also import of finished rolled projects in order to make the Salem plant viable.

Total land acquired for the Salem steel plant is 15.45 square km of which 3.25 sq km have been earmarked for the township. The plant is linked with Salem railway junction by a 8.6 km broad gauge line. Water supply to the plant is drawn from the Cauvery 28 km away. Energy requirements of the plant will be 34 million units per annum.

It is rather strange that the Salem steel plant is not using iron ore available in nearby Kanjamalai region. Estimated reserves of ore in Tamil Nadu have been placed at 800 million tonnes, including 240 million tonnes in Kanjamalai region. The ore is of magnetite type with ferrous plant content of 30 to 45 per cent. It was first considered that economic mining could be carried out with annual concentrate of 0.8 million tonnes per annum.

Mr Khanna has stated that it might be possible for the Salem steel plant to use the Kudremukh iron ore concentrates. But this could depend on an in-depth study and policy decision by Government, he added.

ORIND

THE COMPLETE REFRACTORY MAKERS

(In Technical Collaboration with M/s. HARBISON WALKER REFRACTORIES, PITTSBURGH, USA)

THE HOUSE OF ORIND IS PRODUCING FULL RANGE OF SOPHISTICATED REFRACTORIES FOR INTEGRATED STEEL PLANT, MINI-STEEL PLANTS, STEEL RE-ROLLING MILLS, FOUNDRIES, CEMENT PLANTS, GLASS, PAPER, AND CHEMICAL INDUSTRIES, THERMAL POWER STATION, ETC., BESIDES SANITARY WARES AND STONEWARES, PIPES ETC. ALREADY DEVELOPED AND SUPPLIED REFRACTORY FOR SECONDARY STEEL MAKING SUCH AS VOD, VAR, AOD FURNACES. ORIND IS FULLY EQUIPPED WITH EFFECTIVE AFTER-SALES-SERVICE. ORIND EXTENDS ITS SERVICE FOR REFRACTORY CONSULTATION APPLICATION ETC.

A channel furnace. What can it do for your Foundry?

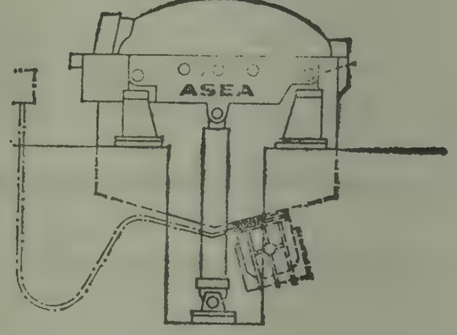
Specially an **ASEA** Furnace

Basically channel furnace is a buffer container for holding and superheating liquid iron. It can operate in duplex with any type of melter. Channel furnace will ensure availability of iron to the moulding lines, independent of the melting furnace. Melting could continue even when the moulding lines are down. You could Superheat Iron specially from a Cupola. Analysis adjustment and pouring at the right temperature is possible which would mean lower rejects. Heavier castings could also be made which is otherwise restricted by the rate of availability of metal.

All these would mean adding flexibility and economy to your operations.

Asea channel furnaces have many more additional features:

- QUICK-CHANGE INDUCTOR— possible to change inductor in 8 hours without having to cool the Vat lining.
- Slag door design and back tilting facility combine to make deslagging much easier.
- Teapot spout ensures slag free pouring.
- The Vat has vertical sides giving the lining maximum strength and making it quicker to reline.
- Experience from several deliveries around the world.



Call ASEA for more details:

SPECIAL ARTICLE

Modernisation of foundry industry

By A SPECIAL CORRESPONDENT

FOR rapid economic growth, heavy investment would have to be made in many of the key sectors of economy and a heavy burden would again fall on the foundry industry which is the basic input for any industry. Iron foundries especially will have to bear substantial share of the responsibility in order to meet the aspirations from all quarters.

Problems with power and availability of other essential inputs such as pig iron, coke, etc, would continue for some more time. This is only a passing phase which any developing economy would experience. Very soon improvements in production and distribution facilities will be made in these fields and it is then the iron foundry industry should be ready to meet the growing demands of castings at reasonable prices. It is here the writer feels that modernisation of iron foundries would be an urgent need.

Modernisation is a very wide term and generally the scope could cover the following : (i) providing better working environment to foundry personnel; (ii) better productivity from foundries; (iii) better yields and lower cost of production; and (iv) better quality of castings, *i.e.* lower rejects.

To achieve all this, an all round improvement in our metal production, moulding technique and pouring technique will have to be made. The purpose of this article is, therefore, to highlight the importance of augmenting the metal production and introduction of automatic pouring. The latter could be frowned upon by authorities in power especially in a developing economy but it is to be accepted that it is much better to provide better working environment to our foundry men rather than exposing them to dust, fumes and high temperatures which generally prevail in all foundries.

Taking first the point on augmenting the metal production, it is widely known that there are furnaces to produce molten iron and moulding lines to convert them into castings. The melting furnaces could be either electric melting furnaces (arc and induction type) or cupola. The furnaces have a certain melting capacity in tonnes/hour. Similarly, the moulding lines also have a certain capacity for production of castings in tonnes/hour. The best one could achieve from a foundry theoretically is the lower of the two. This would naturally assume that there would be no operational, maintenance or raw material problems. However, this is not the case in any industrial activity and this partly answers the reason why our production levels are far too lower than the installed capacity. This situation can be simply explained as follows.

In the event of a problem with the melting furnace, no metal would be produced and thus available for producing castings. Similarly, if there should be a problem with the moulding line, the melting furnace has to be necessarily stopped due to lack of storage capacity. It is here stress on the importance of a storage vessel (only in iron foundries), which when available, the operation in the foundry would be more or less independent of the availability of metal from the melting furnace. Such a storage capacity built with a heating device is called a Holding furnace or Channel furnace.

The Channel furnace, to briefly say is a well insulated vessel to hold liquid iron to which is attached a heating unit called ***inductor.*** In other words it is a reservoir for holding liquid iron which is placed between the melting furnace and the moulding line. As explained earlier, such a furnace if installed would ensure continued operation of the moulding line.

While discussing this subject, it would be interesting to go over the history of Channel furnaces. The first Channel furnace for industrial purpose was designed and built in the beginning of this century by a Swedish Engineer, Fredrick Kjellin. The furnace was installed at Gysinge Bruk, a small steel works in Sweden. This furnace had a charging capacity of 1300-1800 kg of steel and consisted of horizontal vessel. The furnace was fed by a specially designed single phase generator with rated power of approximately 300 kw, 15 Hz. This furnace was no great success mainly due to lining problems. The melting of ferrous material was then abandoned and instead non-ferrous was taken up where lining problems were easier to solve. When continuing the development of Channel furnaces the aim was to increase the power input. The pioneers found the so called 'Pinch effect', a phenomenon which constricts the melt in the Channel and interrupts the current circuit when the current reaches a certain value. Further work was taken up by an American furnace designer, James Wyalt which culminated in the Channel furnace of today. Higher static pressure of the melt on the Channel counteracted the pinch effect and this also paved the way for increasing the inductor power.

Towards the end of fifties, considerable improvements were introduced in the furnace design *e.g.* the tea pot spouts for charging and tapping of the iron. This in combination with the new lining techniques developed, made it possible to start considering the ferrous field again.

The Channel of today is a vertically placed cylinder duly built to accept liquid iron. The heating unit is the *inductor* mounted at the bottom of the vertical cylinder. The liquid metal is allowed to pass through a loop which is surrounded by a coil fed by power. In short the inductor is a short circuited transformer where the loop of metal acts as secondary. The loop of metal is thus heated and the forces created by the current results in a jet flow of metal from the loop and together with the normal convection process hot metal is displaced by cold metal. Thus the entire metal is gradually brought to higher temperature.

Basically a Channel furnace aims at holding the metal temperature to the desired value. Superheating of the metal specially from a cupola is an added application. A recent development in this field is to be able to melt additions of scrap or ferro alloys apart from its accepted role. As stated earlier, the constraint in this was the development of high power inductors as melting would call for higher energy inputs. Both in Europe and the United States inductors of power ratings up to 2,500 kw have already been developed and are known to be in operation. Such a furnace for both melting and holding of iron, offers a great promise for reduced energy consumption and poses a threat to crucible type melting furnaces.

While discussing this, it is also worth mentioning the reason why a crucible furnace is not generally considered useful for holding application. Channel furnace being a sealed furnace very low holding power would be necessary. For example 40 tonnes of liquid metal can be held at say 1.400°C with around 200 kw power in a Channel furnace whereas this power would be required for holding less than half this metal in a crucible furnace.

The advantages of installing a Channel furnace in an iron foundry could be summarised as under :

- A Channel furnace would assist in holding and super-heating of metal. The super-heating facility would specially be advantageous while duplexing iron from a cupola.
- When a holding furnace is available in a foundry, pouring could continue even when the melting furnaces are down.
- When a holding furnace is available in a foundry melting could proceed even if the moulding lines are down.
- Due to the above mentioned two points, the production level could be boosted up substantially which might be welcome when a foundry is operating at a level generally considered as a limit. Thus there is a possibility to increase production at marginal investment.
- With a holding furnace, it is possible to pour at more or less uniform temperatures as super-heating to the desired level is easily possible. Thus the nuclei are not destroyed as holding could be carried out at desired temperatures. The castability of the iron is thus substantially improved in foundries which did not have access to well pre-heated iron earlier.
- Losses due to burning in a Channel furnace are relatively insignificant. This is because a Channel furnace is a sealed furnace.
- Analysis can be easily adjusted and with a Channel furnace the control which one has to exercise in achieving the composition of each melt will not be then required. Variations in analysis from each melt may not be felt when it is mixed with the molten iron in a Channel furnace. This is because of the comparative large volume of metal in the Channel furnace. This variation could also be adjusted when the next charge is made in the melting furnace, if required.
- Bigger castings could be made which, otherwise may be limited by the availability of metal from the melting furnace.
- Channel furnace being a sealed furnace, the losses are at a minimum. For example, a 30 tonne useful capacity holding furnace would have a holding power of around 200 kw. Whereas under similar situations one could require much larger holding power in a crucible type melting furnace.

An off shoot of the Channel fur- e philosophy has been now applied automatic pouring of iron into ulds. This pouring furnace is basically hannel furnace and is placed over the moulding line. Pressure is applied on the metal surface which allows the metal to rise in the pouring chamber and the flow into the moulds can further be controlled by stopper rod.

The aim at improving working condition, reducing cost and improving quality has apparently prompted development of this application. The main functions of a pouring furnace are : serving as a buffer store for metal at pouring stations; keeping the right pouring temperature and even out temperature variations from the melt shop; to even out analysis variations; separating slag from the liquid iron; controlling the pouring speed; giving accuracy of the pouring weight; and reducing man power.

All these factors contribute to advantages namely : higher utilisation of melting plant and moulding line; reduced rejections; improved quality of castings; and higher yield.

Pressure pouring furnace is an useful tool in automatic pouring and the advantages of this are very obvious.

As both Channel furnaces for holding iron and pressure pouring furnaces are based on same philosophy, the lining materials used on these furnaces are almost identical.

Generally speaking holding furnaces did arouse a good deal of interest the world over since their introduction over two decades ago. The pressure pouring furnaces also received almost the same response, but, however, this is more recent, having been introduced into the market about ten years ago. Channel furnaces did go through early frustration and most of the problems were mainly attributed to non-availability of suitable lining materials, specially to line the inductor. But today, this problem has been overcome due to development of suitable lining materials and this is one of the reasons which prompted the development of pressure pouring or introduction of automatic pouring. Lining life of two to three years on *VAT* and six to eighteen months on inductor have already been achieved and it is this long lining life which makes these furnaces more viable to the industry.

The Indian foundries were watching the development and did not introduce holding and this could be partly attributed to their low utilisation and also due to the fears generated from early experiences in Europe.

Normal considerations while choosing lining materials are : (i) Basicity of the slag and the FeO + MnO content; (ii) Holding temperature; and (iii) Analysis of iron.

Both basic and neutral lining are chosen for Channel furnace. The inductor lining can, however, be chosen more independently of the slag conditions. A common factor for inductor lining is a very small content of impurities and proper grain distribution to mininise porosity.

Lining materials for Channel furnace application could be developed within the country and it is only necessary for the local lining suppliers to gain experience before their performance could match with the ones from abroad.

The £1,000 energy awards

A NEW international award for energy sponsored by Mr Ambrose Congreve, chairman of Humphreys & Glasgow Ltd, has been announced. The award will be given for a paper or essay in English covering a research project, process, invention, design evaluation or any other work dealing with some aspect or method of conserving our oil and natural gas resources; the exploitation of alternative energy sources or with improved methods of energy utilisation.

The award will be divided into two sections, the first concerned with fossil fuels (oil, coal, oil shale, etc) and the second with other energy sources (nuclear, biomass, solar, tide, wave, wind, geo-thermal, etc).

The judges will take into consideration the relevance of the entry to the needs and conditions of the country from which it originates.

Technical or economic reviews as such will not be acceptable.

The adjudicating panel will consist of :

Chairman, Michael Kenward, Editor, New Scientist.

Professor Ian Fella, Professor of Energy Conservation, University of Newcastle upon Tyne.

Dr J. L. J. Rosenfeld, Shell Research Ltd, Chester.

The award

The award in each of the two sections will consist of £1,000 and a certificate. In the event of a tie in either or both sections, the prize money will be equally divided between the joint winners.

Entry forms and rules may be had from Humphreys & Glasgow Ltd, at 22 Carlisle Place, London, SW1P 1JA. For further information contact Humphreys & Glasgow Consultants Pvt Ltd at Gamma House, Savarkar Marg, Prabhadevi, Bombay 400 025.

STATE LOANS

Rising share of market borrowings in Plan finance

By JITENDRA H. SANGHVI

THE response to the state governments' loans floated on September 1, 1981 was overwhelming in that against the notified amount of Rs 475.25 crores the actual subscription received amounted to Rs 696.19 crores. Thus, the loans were not only fully subscribed but oversubscribed to such an extent that even after exercising their right to retain subscriptions up to 10 per cent in excess of the notified amount, as many as 10 states, namely, Gujarat, Himachal Pradesh, Jammu & Kashmir, Karnataka, Madhya Pradesh, Maharashtra, Punjab, Tamil Nadu, Uttar Pradesh and West Bengal were able to make only partial allotment to the applicants. Thanks to the good response, last year also all these state governments (except Tamil Nadu) had to resort to partial allotment.

In this first tranche of market borrowing programme by the state governments during 1981-82 all the state governments, except Meghalaya and Sikkim, participated. The noteworthy feature of this year's loans was that while the maturity period at 12 years remained the same as that for the last year's loans, the coupon rate was increased from 6.75 per cent last year to 7.0 per cent this year. This was in keeping with the general escalation in the interest rate structure in the country. All the loans would be redeemable at par after 10 years *i.e.* in 1993. The statewise details of notified subscription and actual allotment are given in the accompanying table.

With the retaining of 10 per cent excess subscription, the gross subscription would amount to Rs 503 crores (Rs 457.25 crores + Rs 45.73 crores). Taking into account Rs 170.57 crores by way of maturing loans of 15 state governments, total net subscription would amount to nearly Rs 332 crores. In September 1980, 21 state governments (all except Sikkim) had floated loans worth Rs 299.75 crores and attracted the actual subscription of Rs 397.97 crores.

Good response from the banks to the recent state loans was partly on account of the hike to be effected in their statutory liquidity ratio from 34 per cent to 34.5 per cent from September 25 and further to 35 per cent from October 30. Following the RBI's decision banks were obliged to evaluate their entire investment portfolio at current market prices rather than a part being evaluated at book value earlier. As a result of higher return available on new loans, prices of some of the old securities have declined to levels lower than their book value. This also would have resulted in more demand for these securities by the banks.

The Annual Plan outlay of the state governments for 1981-82 is placed at Rs 8,471 crores. As regards the financing of this outlay state governments would raise their own resources of Rs 5,471 crores (including Rs 752 crores of additional resource mobilisation) and the Central Government would extend an assistance of Rs 3,000 crores. State governments are expected to raise Rs 782 crores by way of market borrowings during the current financial year. This would form 14.3 per cent of their own resources as compared with 12.6 per cent in 1980-81.

On the face of it this may look quite impressive. But those familiar with the Indian economy need not be told that market borrowing in the Indian

Mr Sanghvi is Assistant Director in the Commerce Research Bureau.

context is a misnomer and by and large represents deficits financing only. Unfortunately, resort to market borrowing has been taken to finance a rising proportion of Plan outlay in recent years. The ratio of market borrowing by the Central and state governments was fairly steady at 10-12 per cent of the total Plan outlay until 1968-69. This ratio went up to 17.6 per cent in the Fourth Plan (1969-70 to 1973-74) to decline to 15.9 per cent in the Fifth Plan (1974-75 to 1977-78) but again to rise to 18.6 per cent in 1978-79 and to 19.8 per cent in 1979-80. In the Sixth Five Year Plan (1980-85) market borrowings of the order of Rs 19,500 crores are expected to finance the public sector Plan outlay of Rs 97,500 crores. In other words, market borrowings would finance 20 per cent of the Plan outlay —the highest ever.

Difficult phase for plantations

COONOOR

THE 88th annual conference of the United Planters' Association of Southern India (UPASI) met at Coonoor last week at a time when the Indian planting industry is passing through a difficult phase. Most plantation crops face a crisis. Market realisations for tea are well below production costs. The recent frost in Brazil may have bailed out the coffee industry out of disaster but plantation circles are far from convinced that the market improvement will continue for long. Growing global competition has put a brake on the euphoria in cardamom and the industry is barely able to keep its head above water.

Speaking on the occasion, Mr R. N. Deogun, president, UPASI, said the terms of trade have deteriorated to the level where many estates were no longer viable and face closure with the attendant implication of large scale labour retrenchment. In stating that the fate of the plantation sector now lay in the realm of public policy, he welcomed the convening of the recent national meet on tea, which sought to analyse the current crisis and recommend ameliorative measures. He expressed the hope that the meet represented the first step on the long haul back to viability.

Mr Deogun dwelt on the infrastructural malaise and burden of adverse policy measures particularly in the area of taxation which constrained the growth and development of plantations. For example, plantations contributed 90 per cent of collections under agricultural income tax and over 75 per cent of the export duty accruals, besides being the only sector paying wealth tax. In fact plantations paid the highest percentage of total taxation in the entire corporate sector in the country.

Mr Deogun also questioned some public policies which, he said, militated against development objectives. He cited the denial of crucial land for growing wood fuel needed by plantations at a time when coal had to be transported at a great cost from distant areas and petroleum-based fuels have skyrocketed in price. Such instances of discrimination, he said, could also be found in energy pricing, credit programming and selection of the industry representatives for nomination on commodity boards as well as "in the arbitrariness of state governments in labour management relations."

Mr Deogun felt that positive policies and provision of proper environment for growth and development could help considerably in putting the industry back on its feet. Growth in the plantation sector was crucial for the country's economy because plantations played a vital role in several areas like land use, employment generation and foreign exchange earnings. In contrast to subsistence farming in field crops, plantations had evolved scientific cultivation and management practices, which enabled them to generate considerable resources from a small land base totalling a mere 0.5 per cent of the country's cultivable land. He mentioned that a hectare of tea generated seven times the employment in paddy cultivation. This employment in the plantation sector guarantees minimum needs and a welfare package unequalled anywhere in the corporate sector. This fact was crucial since over 305 million of our rural population lived in poverty and over 35 million were unemployed. "Agriculture holds the key to future growth and it should be treated as an employment generation rather than employment releasing sector and plantations have a lesson to offer in this direction."

Mr Deogun outlined the impressive record of growth and development of the plantation sector which had registered the highest growth rates in agriculture over the past 15 years. Plantations were the only sector in agriculture where a situation of abundance existed. During the last 15 years the annual increase in production was 13.5 per cent in rubber, 9.8 per cent in coffee, seven per cent in cardamom, and 3.8 per cent

Retail prices of essential commodities in Bombay

in tea as against an actual fall of 0.3 per cent in groundnut and marginal increases of 0.6 per cent in jute, 0.3 per cent in sugarcane and 1.5 per cent in foodgrains. The Sixth Plan targets for plantation aim at an annual growth rate of eight per cent for rubber, seven per cent for coffee, five per cent for tea and 4.5 per cent in cardamom. These could not be achieved unless a healthy environment is created. There was also need for a national labour policy to foster healthy collective bargaining free from coercion violence and intimidation.

Maldistribution of cement

BOMBAY

IT was with a view to checking the flourishing blackmarket in cement that the Government had introduced a new system of cement distribution from October 1, 1978. It empowered the states to completely take over the task of distribution against permits. However, this policy has not only aggravated cement shortages but also led to maldistribution of cement and pushed the blackmarket prices to unprecedented levels. As against the controlled price of Rs 20 before October 1, 1978, cement was then selling at a premium of Rs 20 per bag, whereas now, the commodity is being offered at a premium of Rs 70, as against the official price of Rs 30. In some places it has even been bought for as high a price as Rs 150 per bag.

In fact, the Cement Stockists and Dealers Association of Bombay has pointed out that the public sale quota has fallen drastically under the new distribution policy. In the last quarter of 1978 (October-December 1978) the quota for Bombay alone amounted to 5,30,000 tonnes. Today it is only 21,670 tonnes per quarter.

Explaining the current distribution scheme for cement, Mr S. U. Ladiwala, president of the Cement Stockists and Dealers Association of Bombay, said that prior to its introduction, only 25 per cent of the material allotted for public sale was against permits, while 75 per cent was for free sale. However, at present 100 per cent of cement distribution is against permits.

Another change was the introduction of the co-operative sector in the field of cement distribution. About 50 per cent of cement is now distributed through consumer and marketing co-operatives while the balance is distributed through the private sector.

Prior to October 1978, stockists were representatives of various manufacturers and were allotted quotas for distribution by the manufacturers. But now they are delinked from their manufacturers and receive allotments from the Government. Quotas are now fixed for stockists based on their past performance.

Mr Ladiwala said, under the new other categories of consumers—the government departments, rate contract parties and others who have representatives on the high power committee (appointed by the Government to formulate and make changes in the distribution system) were being allotted bigger quotas at the expense of the public sale quota.

Though the distribution scheme does not make any provision for cement allotments directly to consumers, the Government makes *ad hoc* allotments directly to consumers. This possibly meant that some consumers got allotments both at the regional level and directly from the Government. Huge stocks, therefore, lay unused with certain consumers. Moreover, the State Government, which received approximately 45,000 tonnes of *ad hoc* allotments per quarter, lost approximately Rs 2 crores per annum on direct sales, which it would have realised from sales tax if the sales were completed within Maharashtra.

Referring to huge accumulation in silo stocks due to delays in cement distribution, Mr Ladiwala said, manufacturers had to sometimes cut down production for lack of storage space. The government had also to resort to lifting of silo stocks by road transport, which was expensive and a national waste. This resulted in added costs for the consumer, higher costs of construction leading to higher costs of accommodation. The delinking of stockists from manufacturers had resulted in further delays in despatch of materials and inconvenience to the consumer. Formerly, stockists who had built up commercial relations with their manufacturers were often able to get materials on credit. Now manufacturers have to wait for payment before they can despatch the material.

Mr Ladiwala believed that the co-operative sector had aggravated the situation because many co-operatives were not able to obtain physically the material allotted to them. This material lapses at the end of the quarter and the state loses that much quota. According to Mr Ladiwala, cement distribution is not a remunerative business. The gross margin to the stockists in the cement trade works out to about 7.51 per cent on investment and the net margin after deducting incidentals like transportation and handling charges works out to about 1.9 per cent on investment.

Mr Ladiwala complained that fixation of quotas for stockists had been done on an arbitrary basis. His association has made appeals to the Government to distribute *ad hoc* quotas through stockists who have got the capacity to handle larger quantities. He also alleged that the high power committee formed for regulating policy was ineffec-

Mr B. D. Pande

MR B. D. Pande, the newly appointed Governor of West Bengal, is a civil servant of wide experience. He was Union Cabinet Secretary and Principal Secretary to the Planning Commission till March 1977 before retiring from the Indian Civil Service, which he had joined as early as 1938. For two years from 1963 he was the chairman of the Life Insurance Corporation of India before moving to Bihar as Commissioner-General cum Chief Secretary in 1967. He had served earlier in Bihar for 21 long years. He returned to the Centre soon after and till early 1970 was Secretary in the Department of Heavy Engineering.

Mr Pande headed the National Transport Policy Committee set up by the Planning Commission which produced a comprehensive and brilliant report about the co-ordination of transport services and later he was nominated Chairman of the Railway Reforms Committee.

tual in its working. Moreover, though the distribution of cement was supposed to be fully controlled, a free market for cement was still in existence with prices averaging between Rs 80 to Rs 140 per bag. In the past, free market rates had not crossed Rs 45 per bag and averaged between Rs 35 to Rs 38 per bag.

The association has, therefore, suggested some remedial measures to improve the current system of cement distribution. It has recommended that the public sale quota for the state be reinstated to the levels existing before October 1978, which is, approximately 100,000 tonnes per quarter. A review of the co-operative sector should be undertaken. Stockists should be linked with their manufacturers. Bureaucratic procedures for the issue of material from the point of allotment to the issue of permits should be streamlined. The State Government should take up with the Central Government the issue of the validity period for allotments. The public sale quota allotted should be valid for a period of three months from the date of issue and stocks which are received by the stockists should be liquidated within a fortnight from the date of receipt. The previous system of 75 per cent freesale and 25 per cent under control should be again introduced. A dual system of pricing could also be tried, in which about 25 to 40 per cent of cement is controlled, while the rest is for free sale.

Money

Accounting system of banks

THE RBI study group on the accounting systems of banks has four major tasks before it. Its objectives are to simplify the accounting system, to make it efficient and effective and to generate operational, statistical, statutory control and management information on business and priority sector lending of banks.

In order to achieve these objectives, the study group will first have to have a look at the accounting and the balancing systems of banks at the branches, and consolidation systems at the regional, zonal, or other control offices and at central office.

The major and difficult problems here are three. The general ledgers of branches have grown so large as to have nearly 150 accounting heads, all of which are not required for daily, weekly or monthly purposes. Second there are nearly 100 other types of priority sector lending on which weekly reports are required, but they do not find a place in the general ledger. And finally, the entire system of recording transactions and accounting them is based on scrutinywise analysis of the lending portfolios and schemewise analysis of the deposit structure, but the entire information and reporting requirements are based on a purposewise analysis of the lending portfolios. The result of these divergences is that the strains on the accounting and the balancing systems are much larger. The strains mean that the accounts are not written or balanced for days together and are not tallied for months together.

The second range of problems arises because the information system in banks is separate from the accounting system. It has been the experience of banks themselves that the statements and returns come with seriousness and regularity where information flows as a by-product of accounting. Such instances are rare in banks, but important. Bankers complain of Section 42(2) return not coming in time, but it still comes in more regularly than the priority sector returns. Thus the answer to delays in returns is to so arrange the accounting system as to ensure that information follows as a by-product of accounting.

The third range of problems is the reporting of a wide variety of same information on priority sectors in different formats at different times. Every authority, within the bank or without wants the same information in its own format and it has to be sent again and again separately, once the format changes. It is this multiplicity of reporting requirements that cause unnecessary work burdens on the branches and lead to a loss of credibility of the top management in the eyes of the branches. They seem to think, sometimes with great justification that nobody makes any use of the huge mass of data branches send again and again. The answer to these problems lie in devising a system of master return and updating it from time to time. Further still, it is necessary to ensure that all the data required are in the general ledgers or the subsidiary general ledgers.

Finally, there is the growth area of standardisation of accounting concepts and definitions. Standardisation is essential to an industry—and if there is no standardisation, there would be no comparability or progress. Bankers face these problems in lack of comparability of their accounts of deposits, provisions, other liabilities and assets, tax deductions and many other similar headings. The simplest but the most essential task before the RBI study group is therefore to ensure that all concepts that change the performance of the bank should be standardised to make them comparable. If this is done, there will be real measures of progress, otherwise banks will be competing with each other to show better performance not by doing better work but by using different (not necessarily better) techniques of presentation.

S. G. Shah

EDIBLE OILS

Poor supply management

BOMBAY

THE high prices and low availability of edible oils is clear proof of the failure of government policy in canalising imports of this essential commodity through a single monolithic agency and depending on a grossly inadequate distribution machinery, said Mr Tulsidas Tanna, chairman of the Oils and Seeds Importers Association of India (OSIA), at the association's third annual general meeting. Oil prices had touched their all-time peak levels with groundnut oil leading others at over Rs 16,000 per tonne. This was despite massive imports of over a million tonnes of oil through the State Trading Corporation of India (STC).

Mr Tanna attributed the present grave situation to poor supply management. The volume of imports in 1977 and 1978 when imports were freely

HASTI HDPE PIPES
are ideal for anything that flows.

Multi-purpose
Hasti HDPE Pipes are:

- Chemically inert: they don't rust or corrode.
- Light: they are more economical and easy to transport.
- Flexible: they can be laid easily over rugged terrain, under water, across marshes, etc.
- Longer-lasting: they need no maintenance and last for at least 50 years.
- Tough: they have high flexural and impact resistance.

Hasti Pipes—the ideal piping system for all applications.

allowed was more or less the same as at present, but availability and prices then were excellent. There was a natural rise of 4 to 5 per cent in demand for oils every year with no corresponding increase in supply of both indigenous and imported oils. The need to efficiently manage available supplies, therefore, was all the more important.

Describing the public distribution scheme for edible oils launched in 1979 as over-ambitious, Mr Tanna said, it did not help feed consumers. The association had, therefore, suggested to the Government that private trade channels also be used for the import and distribution of edible oil, at least till the public distribution system was large enough to cover the majority of the population. The present situation demanded a system of distribution which not only encompassed the whole country but was also agile and flexible enough to expeditiously arrange for the timely supply of oil to every part of the country.

Prices tended to fall when imports were made by private trade. Till recently, Mr Tanna said, many members were importing various oils like cottonseed oil and coconut oil for refining and for human consumption. These oils had augmented availability in the market and checked rising prices. Coconut oil, for example, was always priced at least Rs 2,000 per tonne higher than the groundnut oil. Its price receded with the recent import of about 40,000 tonnes of coconut oil on private account. It is now quoted Rs 3,000 below the price of groundnut oil. He commented on the fact that imports of a meagre 40,000 tonnes on private account had made an impact on the market, while imports of a million tonnes by the STC had made no dent on the market.

Mr Tanna was also critical of the high rate of customs duty on imports of vegetable oil by the private trade, making such imports uneconomical. This needlessly penalised the consumers. He felt the Government needed to strike a balance between the interests of farmers and consumers. If prices were unduly depressed, farmers were denied a remunerative return for their produce. On the other hand, consumer interests remained unprotected, by curbing imports through the levy of high rates of duty. The Government would have to decide the price level at which both farmers and consumers would be reasonably benefited.

As a long term strategy, it was necessary to lay emphasis on increasing oilseed production and the Government had allocated substantial funds for the development of oilseeds, especially groundnuts. But, Mr Tanna felt the Government would be well advised

As I see it

Perspective on primary education

EDUCATION has an integral role in the economic development of a country. With the exception of the United Kingdom, where Industrial Revolution had originated, in every other developed country industrialisation was preceded by a massive drive for education. Unfortunately, 34 years after independence the country is burdened with a very much large mass of illiteracy than in 1947. There are an estimated 50 million children outside the school in the age group 6-14. The states, where primary education has fallen particularly behind are West Bengal, Andhra Pradesh, Uttar Pradesh, Bihar, Madhya Pradesh and Rajasthan. The goal of the universalisation of elementary education is still far away. Despite this gap successive five year plans have accorded a reduced importance to elementary education in the matter of financial allocation considered against the total plan outlay.

As a proportion of total plan outlay, the outlay on elementary education declined—from 58 per cent in the First Plan to 32 per cent in the Fifth Plan. No doubt the investment made in each Plan becomes the background or infrastructure on which the programmes in the subsequent Plan can be worked out. Nevertheless the backlog of illiteracy in the country calls for accelerated efforts. Considering all aspects the Working Group on Education suggested an outlay of Rs 1,700 crores on elementary education for the Sixth Plan. But this has been reduced to Rs 905 crores.

The Working Group on Education suggested the fulfilment of the target of universalisation of primary education during the period of the Sixth Plan. The current target is to achieve 95 per cent enrolment. For full enrolment of the children in the age group 6-14 years it would require another five year plan, according to the present stipulation. The target is further to secure 50 per cent enrolment in the middle level during the Sixth Plan and another fifty per cent enrolment in the succeeding Plan. Apparently in many states the enrolment ratio was not going up and that after a level had been reached the curve no longer went up. Consequently even after 20 years from now 20 per cent of the children in the age group 6-14 would remain outside the school system, if the broader sociological aspects are not tackled right now.

The current teacher-pupil ratio is 1:41 in the primary classes and 1:25 to 35 in the middle school classes. In the case of higher education the ratio is 1:30 to 35. In another twenty years it would be necessary to cover about 20 crore children by the system of elementary education. This, in turn, would call for the employment of an adequate number of teachers and the financial resources to support them. The Public Accounts Committee (1980-81) of the Lok Sabha has suggested that the services of the unemployed youth should be obtained to tackle the problem of illiteracy. "The youth who volunteer to work in this field should be given a modest remuneration and also some priority in the matter of obtaining a regular job," the Committee says. The problem of teaching science to the primary students calls for a special consideration, since at the primary stage nearly 1.55 lakh science teachers teaching science *had not even studied* the subject.

Education of the children of scheduled tribes living in sparsely populated areas presents special problems. Ashram schools (providing free residence, board and all other educational expenses) set up in the states in several cases do not have an adequate number of students. For example 291 ashram schools in Andhra Pradesh had 17,267 students in 1976-77—less than sixty per school; 138 schools in MP had only 5,520 students.

Subhash Chandra Sarker

to give consideration to certain short-term measures for overcoming the present edible oil crisis. The Government should enlist the services of the private trade and industry in the import and distribution of edible oil. The Government, he said, should allow import of oils against additional licences held by export houses. It was also important to increase the volume of agricultural produce exports, especially certain value-added items like HPS groundnuts.

He suggested a scheme whereby the STC could begin high-seas sales of imported oils to private parties. Alternatively, STC's import contracts could be transferred to private parties against surrender of specified licences. The STC could recover the cost of goods plus some nominal service fees. The OSIA was in a position to place indents with the STC on behalf of its members and also to monitor the effective implementation of the scheme. The success of the above schemes in bringing down edible oil prices to a reasonable level would depend on suitable adjustments by the Government in the import duty structure, he said.

Remarking that STC's imports of edible oils for ready consumption at the cost of local processing industries was strange, he said, every importing country in the world imported raw materials for processing at home as far as possible. To conserve foreign exchange and use the vast idle crushing capacities in the country, Mr Tanna recommended imports of oilseeds like rapeseed and sunflower seeds.

CORPORATE SECTOR

In the market

Fibreglass Pilkington

Fibreglass Pilkington Ltd (Registered office: 9, Wallace Street, Bombay 400 001) is offering for public subscription at par 1,10,948 (13.5 per cent) secured convertible debentures of Rs 156 each totalling Rs 1.73 crores. Apart from this, 51,432 (13.5 per cent) secured convertible debentures of Rs 156 each at par totalling Rs 80.23 lakhs are being offered to resident Indian equity share-holders of the company and 6,000 (13.5 per cent) secured convertible debentures of Rs 156 each at par totalling Rs 9.36 lakhs have been reserved for allotment to resident Indian directors and/or employees of the company. The subscription list will open on September 21 and will close on October 1 or earlier but not before September 23.

The company was incorporated as a public limited company in 1962 for the manufacture of fibreglass at Thane, Maharashtra. The object of the present issue is to finance a part of the capital outlay required for the modernisation of the company's plant and machinery at Thane and to reduce its non-resident interest from 50.39 per cent to 40 per cent.

Indian Rayon

The Indian Rayon Corporation Ltd (Registered office: Junagadh-Veraval Road, Veraval-362 266 Gujarat) is offering for public subscription at par 5 lakh 13.5 per cent secured debentures of Rs 100 each totalling Rs 5 crores. The subscription list which opened on September 14 will close on September 24.

The company was incorporated in September 1956 for the manufacture of viscose filament rayon yarn at Veraval. It is setting up a plant at Halol, Panchmahal district in Gujarat for the manufacture of 6,000 tonnes per annum of high tension insulators and bushings and another plant at Malkhed, District Gulbarga in Karnataka for the manufacture of 5.4 lakh tonnes per annum of portland cement. The object of the present issue is to augment the company's resources.

Shree Bhawani Paper Mills

Shree Bhawani Paper Mills Limited (Registered Office: 33 Dayanand Marg, Allahabad 211 002) is entering the capital market with a public issue of 11,60,000 equity shares of Rs 10 each for cash at par totalling Rs 1.16 crores. The subscription list will open on September 28 and close on October 16 or earlier but not before September 30.

The capital issue will be used by the company to partly finance an integrated pulp and paper plant for the manufacture of a wide variety of writing and printing paper with an annual installed capacity of 8,250 tonnes. The project will be located at Rae Bareli (UP). The total cost of the project is estimated at Rs 6 crores and is being financed by equity capital of Rs 2 crores and term loans from IDBI, IFCI, ICICI and PICUP to the extent of Rs 4 crores. There will be a Central cash subsidy of Rs 15 lakhs because the project is located in a backward area. The entire plant and machinery will be procured indigenously. The pulp mill is scheduled for commissioning by April 1982 and the entire machinery by June 1982. Commercial production is expected to commence by July 1982.

Other developments

Mafatlal Fine Spg to expand

The Mafatlal Fine Spinning and Manufacturing Co Ltd has received permission to increase its capacity by 30,000 spindles, of which 14,000 will be in Navsari and the rest in Bombay. Disclosing this at the company's annual general meeting, chairman, Mr Arvind Mafatlal, said that the company's installed spinning capacity would thus go up from 150,000 spindles to 180,000 spindles.

He described the last year as a difficult period for the industry. Power and raw material costs had gone up by 50 per cent in the past 12 months, but the company was not able to pass on these costs to the consumer because of consumer resistance. There have been severe power restrictions in the past three months. Though the power situation has improved in Gujarat now, the situation has remained unchanged in Maharashtra, where there is a 35 per cent power cut.

In spite of these constraints, the turnover for the first five months from April to August this year was higher at Rs 37.40 crores—Rs 31.70 crores for textiles and Rs 5.71 crores for chemicals. The average rate of growth was 11.4 per cent over last year's figure of Rs 33 crores. Exports during the year have however, dropped.

He said that company's chemical plant was doing well even though there was a shortage of raw materials since there was a shortage of raw materials from Mettur Chemical.

Mr Mafatlal said that long term prospects for the industry were good though the short-term picture was grim. Credits were becoming more difficult and profits were under pressure. The company's first phase of modernisation was over and the second phase was under implementation. There would be an investment of Rs 20 crores in the second phase. Of this, the Industrial Development Bank of India had sanctioned Rs 6 crores. The remaining amount would be generated from internal resources.

Bajaj Auto pays 25 per cent

Sales and other income of Bajaj Auto Ltd for the year ended June 1981 increased to Rs 109.61 crores from Rs 53.37 crores in the previous year. The net profit, after providing Rs 6.36 crores (Rs 2.99 crores) for depreciation and Rs 7.25 crores (Rs 4.25 crores) for taxation, amounted to Rs 7.47 crores (Rs 4.89 crores). The equity dividend recommended for the year under review is 25 per cent (20 per cent). An amount of Rs 2.66 crores (Rs 1.13 crores) is transferred to investment allowance reserve and Rs 4.19 crores (Rs 2.66 crores) to general reserve. Production of two-wheelers during the year under review, was 150,480 numbers (88,651 numbers) and that of three-wheelers was 22,540 numbers (13,701 numbers). Exports during the year under review were Rs 13.32 crores (Rs 10.22 crores).

Chemplast: Sales rise

Chemicals and Plastics India Ltd, has reported higher sales for the year ended March 1981 at Rs 21.20 crores compared to Rs 14.76 crores in the previous year. The net profit, after providing Rs 83.76 lakhs (Rs 51.35 lakhs) for interest payments, Rs 67.50 lakhs (Rs 51.67 lakhs) for depreciation and Rs 34.50 lakhs (Rs 87 lakhs) for taxation, amounted to Rs 1.27 crores (Rs 98.94 lakhs). The equity dividend recommended for the year under review is 16 per cent. An amount of Rs 42 lakhs (Rs 21.60 lakhs) is transferred to investment allowance reserve and Rs 14.75 lakhs (Rs 48 lakhs) to general reserve. Production of

PVC resins during the year under review was 12,108 tonnes (10,872 tonnes) and that of PVC pipes and fittings 6,744 tonnes (4,874 tonnes).

ECC secures Iraqi contract

Engineering Construction Corporation Ltd (ECC), a subsidiary of Larsen & Toubro Ltd has been awarded a contract valued at Rs 40 crores for the construction of Police Headquarters Building in Baghdad by the State Organisation of Buildings, Ministry of Housing and Construction, Government of Iraq. The contract is on a turnkey basis covering, civil, electrical installation, airconditioning telephone, fire-detection, fire-fighting, sanitary and other special services. The building will have a facade of precast units. ECC has to complete this contract within 30 months beginning from August 8, 1981. ECC is also currently executing two other contracts in Iraq valued at Rs 26 crores.

Klayman Porcelains on stream

Klayman Porcelains Ltd, a joint venture of Andhra Pradesh Industrial Development Corporation Ltd, has gone into commercial production since June 24, 1981. The company's project set up at a total cost of Rs 1.57 crores, has an annual licensed capacity for manufacture of 1,320 tonnes of sophisticated range of ceramic tableware. The civil works of the company started in June 1979 and trial production commenced in March 1981, within the record period of less than two years. The company's plant has been set up with the most modern Japanese techniques and the latest German firing technology. Product sales started in April 1981 and presently the company's products are marketed in western and southern regions of the country. Its products have received encouraging response from the market.

Deccan Fibre Glass starts commercial production

Deccan Fibre Glass Ltd, which has its factory located at Village Timmapur, a notified backward area of Shadnagar Taluq, Mahaboobnagar district, Andhra Pradesh, on the Hyderabad-Bangalore highway has gone into commercial production. The company's unit, the only one of its kind in south India, involved a total project cost of Rs 11 crores. It is a joint sector venture of the Andhra Pradesh Industrial Development Corporation and Philips Carbon Black Ltd—a member of the Duncan group, who are the well-known leaders in carbon black technology in the country. Utilising the most modern technology, Deccan Fibres is now producing a wide range of products from yarn of various counts, rovings, woven rovings as well as chopped strands and chopped strand mats. It is using the trade name 'Decca Fibre' for its products. The products have a wide spectrum of use and have various applications like building, sanitaryware, sewerages, pipes for transportation of water etc. The company's plant has an annual production capacity of 2,000 tonnes of 'Decca-fibre' products.

Rajalakshmi Mills: Higher sales

The Rajalakshmi Mills Ltd has reported higher sales for the year ended March 1981 at Rs 9.98 crores compared to Rs 8.95 crores in the previous year. The net profit, after providing Rs. 16.93 lakhs (Rs 16.11 lakhs) for depreciation and Rs 49.50 lakhs (Rs 45.25 lakhs) for taxation, was Rs 48.21 lakhs (Rs 33.62 lakhs). The equity dividend recommended for the year under review is 16 per cent (15 per cent). An amount of Rs 3.35 lakhs (Rs 8.25 lakhs) is transfered to investment allowance reserve and Rs 36.25 lakh (Rs 15 lakhs) to general reserve.

Forthcoming company meetings

SEPTEMBER 19 TO SEPTEMBER 25

GWALIOR RAYON SILK MFG. (WVG) COMPANY LTD, Birlagram, Nagda (MP), (*September* 19, 4.15 *p.m.*)

INDIA STEAMSHIP COMPANY LTD, Grand Hotel, 15, Jawaharlal Nehru Road, Calcutta-700 013 (*September* 21, 3.30 *p.m.*)

BALMER LAWRIE & CO LTD, 21, Netaji Subhas Road, Calcutta, (*September* 21, 11.30 *a.m.*)

ORIENT PAPER & INDUSTRIES LTD, Brajrajnagar, Near Jharsuguda, District Sambalpur, Orissa, (*September* 22, 2.30 *p.m.*)

RATNAKAR SHIPPING COMPANY LTD, 9/1, R. N. Mukhejee Road, Calcutta-700 001. (*September* 22, 3 *p.m.*)

INDIAN ORGANIC CHEMICALS LTD, Jai Hind College Auditorium, A Road, Churchgate, Bombay-400 020. (*September* 23, 4.30 *p.m.*)

SRI RAMAKRISHNA STEEL INDUSTRIES LTD, Sri Ramakrishna Kalyana Mandapam Avarampalayam Road, Pappanaickenpalayam, Coimbatore-641 037, (*September* 23, 2.30 *p.m.*)

The profit figures shown in the above statement have been calculated by making, wherever necessary, additions or deductions of various items so as to show the true profit pertaining to the particular year on a uniform and comparable basis. Similar adjustments are sometimee made in the above data. Totals may not add up due to rounding off.

Company Meeting

THE TATA POWER COMPANY LIMITED

Chairman's Statement

THE following is the summary of the Statement of Mr. Naval H. Tata, Chairman of the Tata Power Company Limited for the year 1980-81. The Annual General Meeting will be held on Monday, the 21st September 1981 at 2.30 p.m. at the Bombay House Auditorium.

TO
THE MEMBERS

In reviewing the operations of the Company during the year, it is difficult to avoid reference to power shortages and our efforts to mitigate their impact on the productive capacity of our region.

Load Growth

In spite of the prevailing statutory restrictions on demand and energy, the Companies' sales showed a growth rate of 5 per cent over the previous year. This is an indicator of the growing basic and irreducible needs of this metropolis. Commendable efforts in power shortage management had to be made by all concerned and many consumers were permitted, to utilise surplus energy potential available during non-peak hours. In spite of these measures, the demand for electricity has continued to grow at a faster rate, outstripping the available generating capacity.

Equity Issue

The capital requirements of the pioneering 500 MW Project involved an equity issue aggregating Rs. 17.5 crores. It was gratifying to find that the issue was over-subscribed by almost four times indicating the confidence of the investors in your Company and their faith in the capability of the management in handling expansion projects of this magnitude.

Trombay 500 MW Unit 5

Erection work of the 500 MW Unit has proceeded as per plans, in spite of various constraints, viz. delayed supply and non-availability of materials like sand, steel and cement. These limiting factors were overcome by expediting critical activities on a crash basis. By adopting methods of mechanisation as far as possible, we were able to achieve accelerated construction activity which otherwise would not have been possible by conventional manual methods.

We have introduced all measures for quality control, including quality audit, in the assembly and installation work of the 500 MW Unit. Every effort is being made to ensure that the construction programme aims at the ideal of the "Zero Defect" target to attain what is known as "success at the first attempt", a technique which has been successfully applied to space programmes.

Barring any major obstacles in our path, we expect the unit to be commissioned in the financial year 1982-83. This unit will help, to some extent, in reducing the wide imbalance between demand and supply of energy. However, even after this unit is commissioned, I am afraid that power shortages will continue and the relief provided by this 500 MW unit may not be adequate enough.

500 MW Unit 6 A Necessity

It is in this context that the need for additional generating capacity becomes most urgent for replacement of ageing units by more modern, reliable and fuel-efficient ones. This has become much more relevant and techno-economically justified in view of the further steep increases in fuel prices and continued power shortages in the region. I am happy to report that our proposal to replace the three 60 MW units at Trombay by an additional 500 MW unit which, like the first 500 MW Unit will be more fuel efficient and more environmentally compatible than the ageing units 1, 2 and 3, is being seriously considered by the Maharashtra Government. I am very hopeful that the Government of Maharashtra and the Central Government will not delay their decision, since even the 150 MW unit 4 at Trombay is 16 years old and will normally be due for retirement in another 9/10 years.

The cost of the first 500 MW Project was estimated around Rs. 87 crores in 1969 when first proposed, but was reckoned at Rs. 180 crores after providing a cushion for price escalation and physical contingencies, when finally approved by the Government and the World Bank in late 1977. However, based on the actual orders placed, the final cost is likely to be higher. In the light of this experience, the need for early clearance of our second 500 MW Project at all levels, is of paramount importance. Cost increases arising out of delays in approval of power projects impose an additional strain in raising resources which are already scarce and costly. In other words, delays at any level in the clearanc of our proposed 500 MV Unit will only penalise ou consumers who are already over-burdened an adversely affected by th non-availability of powe apart from the curren high fuel costs. As in th case of our first 500 MV Project, the available infrastructure at the sit lends itself to the speedies execution of the capacit addition at the minimu cost.

Power Supply Tariffs

The subject of financia management and tariffs o electricity undertakings i India was studied in detail by the Rajadhyaksh Committee on power. Th final report of the Committee recommends tha the returns should be adequate to enable an undertaking to operate on soun commercial principles, a well as to provide returns to sustain growth withou excessive dependence o external finance. The present tariff structure unde the Electricity (Supply Act, 1948, does not provide for an element to generate finances for sustaining growth without depending on external finance. I hope that the recommendations of this Committee, which are in the overall interest of all the consumers, will be carefully considered and implemented even for private utilities.

Increasing Fuel Costs

Arising out of periodic oil price increase by the OPEC countries, the cost of fuel oil, which was originally around Rs. 189 per tonne in 1973, has presently mounted a little more than 13 times to Rs. 2,52 per tonne. The corresponding fuel oil cost per unit of thermal energy generated has risen from 5 paise to 66 paise. As a direct consequence of these increases, the fuel adjustment charges recovered from our consumers under our power supply tariffs had to increase from about 2.0 paise per unit to 20.5 paise, per unit. Thus the fuel adjustment charge has far exceeded the basic cost of electricity, which is in the neighbourhood of 15 to 16 paise per unit. We are conscious of the growing burden arising out of the impact of fuel costs on our consumers. On our part, we are sparing no efforts, with the assistance of the Government of Maharashtra, to obtain exemption from surcharges levied on residual fuel oil. These same surcharges, incidentally, are not applicable to fuel oil used in refineries and for captive generation of electricity for fertiliser plants. We are concerned that such a heavy burden on the industrial sector is sure to affect their operations appreciably. In an endeavour to reduce such high costs, we are actively pursuing the procurement of coal supplies which are comparatively more economical for our Trombay Thermal Station. The multi-fuel Trombay Thermal Station is dependent on fuels made available in the overall perspective and we have little control over the mix, the quantity and the cost of these fuels. Since the benefit from this station accrues to the State grid, it is worthwhile considering a proposal for sharing the total fuel costs by all consumers in the State uniformly, by averaging the cost. We have put forward this suggestion to the State Government and I do hope that it will not only receive the urgent attention of the Government but our consumers will also support our plea to the Government through their representative associations. I am grateful for the assurance of the support of the Millowners' Association in our efforts.

Consumers

I would like to take this opportunity to express my gratitude and appreciation to all our consumers for their whole-hearted response to our request for conservation and economy in power consumption, at a time when statutory restrictions on energy consumption and maximum demand continued. I look forward to their continued co-operation in this connection till the 500 MW Unit at Trombay goes into commercial operation, after which it is expected that the shortages and interruptions may be reduced to some extent.

Government and The State Electricity Board

Under the leadership of our Chief Minister, Shri A. R. Antulay, and the Honourable Minister for Energy, Shri Jayantrao Tilak, Maharashtra State is taking rapid strides towards self-sufficiency in power generation. We wish to assure the Chief Minister and all his cabinet colleagues that we will do everything to enhance the prestige and reputation of Maharashtra as a premier industrial State. We are grateful for the continued goodwill of the State Government in meeting the power/energy demands of the State in the most optimal manner. This goodwill will be further enhanced and cemented, now that we have Shri M. R. Natarajan and Shri J. Innocent, as the two representatives of the State Government on our Board. We extend to them a hearty welcome. Our relationship with the State Electricity Board continues to remain cordial and we are grateful to its Chairman, Shri S. N. Misra, for his understanding and co-operation in dealing with the difficult task of meeting energy/capacity shortages which have arisen from time to time. These have been tackled very effectively with minimum inconvenience to all categories of consumers.

The harmonious relationship between staff and management continued. Members will certainly join me in expressing our appreciation of the sustained admirable performance of the Companies' officers and staff at all levels. We can take legitimate pride in claiming that our Companies have an efficient team of management, engineers, technicians and skilled workmen and we are happy that our capabilities are recognised both at home and abroad.

10th August, 1981.

(NAVAL H. TATA)
Chairman

BUILD YOUR INDUSTRY WITH SOLID BRICKS

Sound reasons Why Goa is Suitable For Location of Industrial Projects

- Abundant natural resources
- Integrated network of communication
- Industrial Estates and Sheds
- Finance on easy terms
- Machinery on 'HIRE PURCHASE'
- Import Assistance
- Technicians Assistance Scheme
- Power Subsidy
- Rent Subsidy
- Capital Subsidy
- Price Preferenee
- Sales Tax Exemption etc.

Chairman's Speech

SPEECH delivered by Cavaliere G. K. Devarajulu, Chairman, at the 71st Annual General Meeting of the Company on 10th September, 1981.

Ladies and Gentlemen,

I have great pleasure in welcoming you all to the 71st Annual General Body Meeting of your Company, in this new Building, which will not only house the office of your company but also of associate companies.

The notice calling for the meeting, the Annual Accounts and the Directors' Report for the year ended 31st March, 1981 have been in your hands for some time and with your permission, I shall take them as read:

I am particularly happy to observe that the performance of the Textile Industry has been good for the second year in succession, at a time when the general industrial production has been showing a negative growth. In spite of crippling power cuts and several other infrastructural constraints like shortages of cotton, coal, oil, etc., the Textile Industry has performed extremely well.

Indian Economic Scene:

High inflation fueled by the supply of unaccounted money has been the bane of the Indian Economy. The inflation is raging at 14.8 per cent unabated. The Government in its bid to contain this inflation has announced a package of monetary and fiscal measures, which include a hike in bank rate from 9 per cent to 10 per cent, revision in deposit ratio, restriction on lendings, adjustments in margin etc. These measures would adversely affect the growth, since money would be scarce and costlier for productive purposes. The new policy of "Dear money" will create more unaccounted money which will be cheaper.

The sixth plan has been drawn up with an investment of Rs. 1,72,210 crores of which the private sector's share is Rs. 74,710 crores. The Finance Minister and the IDBI Chief have advised the large houses in particular and Corporate sector in general not to rely on institutional finance for the Capital requirements and to tap the Investment market instead. I doubt the possibility of mobilising such a huge capital in the not so responsive investment market because there are no savings left with the Public.

The Industrial sector has registered a growth rate of 3.6 per cent in 1980-81 which is far below the target figure of 8.5 per cent. The Industry Ministry has fixed a target of 12 per cent for the year 1981-82, which is again too much to accomplish. The remedies to accelerate growth, are to be found by change of policies to improve the viability and increased production to yield better returns.

Cost Escalation:

The Cotton Textile Industry has been caught in a cost-push-vortex. The cumulative impact of the increase in the cost of cotton, power, and wages has made many a mill non-viable. During the past ten months alone the cost of production has increased by 32 per cent. While on the other hand the price of yarn has moved up only by 5 per cent and that of the mill made cloth by 15 per cent. At the sametime, the finished goods are accumulating in the godowns.

In fact, the financial working of a majority of the units is in the red for the past few months. If the situation does not improve, a number of units will be sick again.

Wages and Dearness Allowance:

Tamil Nadu is paying the highest wage for Textile labour in the country today. Our D.A. is also very high at Rs. 567 for August '81. This higher wages does not contribute to productivity or profitability and the mill whether viable or not has no option but to bear the burden passively. Thus the social cost is so high and so rigid that the industry needs a high profit to survive. When it makes large profits, as in the last two years, it pays heavy taxes at 65 per cent and retains hardly 10 per cent of the profit earned. Taxes are the main drain on the liquid resources. When there is a loss, the tax already paid is neither refunded nor adjusted but the loss wipes out the relatively small Capital and reserves and before one realises this danger, bankruptcy becomes imminent. It is high time that the Government considers a three year assessment instead of every year, at least for Textile Industry.

Raw material :

The cotton crop has again failed. It was estimated at 81.50 lakh bales and was revised to 78.50 lakh bales but the actual production is only 75.50 lakh bales. The maximum shortage is in the short staple varieties. The prices are ruling high from the beginning of the season. Prices of short staple varieties increased by 50 per cent while the others increased by 15 per cent only. Despite the high cost of the cotton, consumption touched a new mark of 77.04 lakh bales last year.

The multifibre approach has helped to reduce the pressure on cotton to a certain extent. But the high cost of the staple fibre, both indigenous and imported, has had a dampening effect on the use of man-made fibre.

Monopoly procurement of cotton :

There is an unfortunate move to introduce monopoly procurement of cotton in Gujarat, Tamil Nadu, Punjab etc. This scheme as implemented in Maharashtra by the Maharashtra State Co-operative Marketing Federation is far from being satisfactory. The pricing policy by this agency has affected the Industry adversely.

Production :

Despite constraints the Industry has performed well. The Cotton cloth and cotton yarn production have increased by 8.42 per cent and 11.13 per cent respectively over the previous year.

The Textile Industry has performed creditably on the export front against heavy odds. Export of mill made and powerloom cloth has recorded an increase of 13.5 per cent over the previous year's figure. Statistics show that Textiles is the largest single foreign exchange earner. An ambitious target of Rs. 900 crores has been fixed for the current year, which is hard to achieve in the face of stiff global competition in an unresponsive market, under the present unremunerative rates.

The increase in production is not commensurate either with the plan or the growth of population. The responsibility of clothing the population is on both organised and decentralised sectors equally. The decentralised sector is pampered and very liberally subsidised while the organised sector is being crippled.

Precarious power position :

The power situation is precarious in most states. Despite comfortable hydel prospects, the outlook is bleak and causes serious concern. In Tamil Nadu, according to the Minister for Electricity, the present grid demand is 6 per cent more than the total supply. Urgent and immediate measures to introduce better project management techniques at the Electricity Boards, correction of the technical deficiencies and improved maintenance may help, and that too, in the long run only.

Modernisation—the Key to progress :

The draft Five Year Plan 1978-83 referred to the situation faced by the Textile Industry as steadily falling in productivity on account of lack of modernisation and generally increasing costs. It also mentioned a few contributory factors to the prevalent sickness of this organised sector. Modernisation is the key to efficient and economic working of this industry and ICMF, realising its importance, has pleaded for the continuance of the 'Soft Loan' scheme of the IDBI on a permanent basis. Besides this, it has also advocated the creation of a 'Modernisation Reserve', out of tax payments, in the accounts of the Companies, so that a fair portion of their earnings are available to the industry for this vital purpose.

The need for removing and preventing the recurrence of sickness in the Textile Industry, which plays a vital role in national economy, employing directly a labour force of 11.3 lakh and involved in the production of a basic necessity to the population, hardly requires to be stressed.

Employee-Employer relationship :

Deteriorating standards of public morality, fall in ethical values and discipline, rampant corruption are the order of the day. These, together with the militant trade union activities and rivalry, have shattered good relationships and threaten the very existence of the Industrial activities.

Fortunately in the Textile Industry, the number of strikes and lock outs this year was smaller as compared to last year and our mills in particular enjoyed smooth working throughout.

Company's performance :

The performance of your Company has been gratifying with an increase of 23.5 per cent in turnover compared to last year's working which was only 10 months, due to the state-wide strike in the industry. This year's profit includes the profit of Rs. 58.86 lakhs received on sale of shares. The depreciation is higher at Rs. 174.33 lakhs as against Rs. 114.95 lakhs last year. Similarly, the investment allowance has gone up from Rs. 39.26 lakhs in 1980 to Rs. 57.18 lakhs in 1981. After providing for all, including Rs. 135 lakhs for taxes, we have been able to transfer a sum of Rs. 127 lakhs to General Reserve as against Rs. 102 lakhs last year. A dividend of 16 per cent on the enhanced share capital of Rs. 3,73,50,000 has been recommended after the Bonus issue at the ratio of 1 : 1.

Programmes for the future :

The Company has a few programmes on hand and on the anvil. The expansion at the Palladam Mills is progressing. The old looms at the Coimbatore Mills are being replaced with modern high speed Lakshmi-Ruti 'C' type weaving machines. We have also imported 4 new Ruti-Rapier weaving machines which will be installed shortly at our Coimbatore Mills. The existing processing facilities are being improved and expanded with the addition of new machinery. A new showroom at Pondicherry will be added to our sales outlets this year.

Acknowledgement :

I shall avail this opportunity, before concluding, to wish well all our valued customers, dealers and suppliers and to record our appreciation of the devoted and sincere work put in by our employees, staff and officers at all levels. I also thank my colleagues on the Board for their wise counsel and co-operation in guiding the conduct of the affairs of the company.

I pray Goddess Lakshmi to shower her choicest blessings for the continued prosperity of all of us.

Thank you all.

NOTE : This does not purport to be a record of the proceedings of the Annual General Body Meeting.

EQUITIES

Drift persists

Bombay, September 14

With the emergence of renewed short-selling and bull offerings, equities yielded further ground during the past week. The smart recovery after the mid-week, however, lifted equity prices. As a result on balance losses were only small-to-modest in most cases. However, activity continued to be restricted and the undertone at the close of the week was steady.

At the outset of business, equity sentiment was badly hit by rumours that the Shipping Development Fund Committee would not allow any shipping company to pay more than 10 per cent dividend. The subsequent interpretation was that the shipping companies could pay 10 per cent dividend but they are required to get the consent of SDFC if the dividend is in excess of 10 per cent.

Sentiment was also aided later by the reports that the International Monetary Fund (IMF) had tentatively approved the 5.68 billion dollar loan to India, the largest in IMF's history. The normal badla charges also helped pivotals. Besides, BSE imposed special margins on more bears to arrest selling.

Century, which dropped from Rs 808 to Rs 787, staged a smart rally to reach the level of Rs 813.50. The scrip, however, again came in for small offerings and the price was finally placed at Rs 806, with a net nominal loss of two points. Standard, however, suffered a severe setback and the price plummeted from Rs 515 to Rs 490. With the lower level inviting short-covering and replacement support, the scrip closed at Rs 496, yet it lost as much as 19 points from the previous rates.

Shipping shares were the worst affected by heavy offerings. G.E. Shipping declined steeply from Rs 49.75 to Rs 38.50 before closing finally at Rs 42.50. The net loss was Rs 7.25. Scindia lost Rs 2.25 at Rs 22.50. TELCO came in for renewed offerings and yielded further 17 points. ACC, Tata Steel, Bombay Dyeing, IDI, Tata Chemicals, Tata Oil, Gwalior Rayon, PAL and NRC were also caught in the selling wave. Voltas, however, was in the limelight on informed support and the scrip recorded a significant gain of Rs 26 at Rs 235. Amar Dye-Chem recovered by Rs 6.50 to Rs 150. L & T and Tata Mills were steady.

Market Gossip

Black money bonds in black

THE verdict of the Supreme Court in favour of the Government's special bearer bonds scheme has set at rest the uncertainties about its future. Following the judgment bearer bonds reportedly started fetching higher premiums. In Bombay bonds were reported to be attracting a premium of Rs 2,500 and selling at Rs 12,500. In Delhi a few bonds were reported to have been transacted at a premium of Rs 2,000. The Union Finance Minister, Mr R. Venkataraman, has categorically stated that the Government would not reissue bearer bonds. Since the black money generation continues with full vigour, the attractiveness of the bearer bonds remains and the stoppage of their supplies logically makes them saleable at a premium.

Another reason for this premium to go up is the continued raids by the Income-tax Department on various traders and professionals. This would generate further demand for these bonds which would make them dearer. If one is caught with a large amount of currency notes, one is liable to explain the possession to the satisfaction of the income-tax authority. But if one possesses bearer bonds in any quantity it is legal and safe. Not a single question will be asked.

Reports have it that it is because of this safety that quite a few black money transactions, including those relating to land and flats take place with the exchange of bonds. Some people have also entered into forward trading in the bonds. The Bombay Stock Exchange has also listed bearer bonds for trading. The Government's decision that the repayment of the special bearer bonds would be made by 'account payee cheque or draft' does not diminish their attractiveness, rather enhances it. It is believed in market circles that in about two months' time premium on bonds would go up to as high as Rs 5,000. It is the irony that bonds issued to mop up black money themselves are being traded in black and are in the process of generating further black money.

Uptrend in silver

THE silver markets are once again in the limelight. Prices have shot up in both the domestic and overseas markets. In Bombay last month silver was quoted at around Rs 2.650 and now commands around Rs 2.800 per kg. In overseas markets, the price has moved up from $8.50 to $11 per ounce. Markets abroad have strengthened partly because of speculation and partly because of political tensions in Poland, South Africa and Libya. Marketmen are disturbed by the invasion of Angola by South Africa and the speculation is that gold from South Africa may not be available if the fight is a prolonged one and black labour in mines downs its tools. This was the immediate reason for the gold price to advance from $425 to $446 and it has found a sympathetic rise in silver. Unsettled conditions in Poland are said to be responsible for a drop in silver production and year's output is expected to be down to 11.4 million ounces from 23.1 million ounces last year.

Japan has reportedly changed its mind and decided to postpone the release of 11.57 million ounces of silver to domestic consumers through four public auctions. The reason given is that it was feared that disposal of official stocks of silver will depress silver prices. In 1980 Japan has sold one lakh ounces of silver to consumers. In the neighbouring country of China from where reports of lot of smuggling of silver to Hongkong had appeared the authorities are said to have come down heavily on smugglers. This has reduced the inflow of Chinese coins and silver to Hongkong and western markets. This is another factor which has influenced the world silver market.

Within the country however, silver prices have improved on demand from smugglers who are believed to have lifted 25 to 30 tonnes in August and about 10 tonnes so far during this month. At one time world prices of silver were lower than in India but these have now risen to leave a sufficient margin for smugglers to be active (mainly in Gujarat and Punjab areas). Internal demand is also likely to revive by the month-end when the Diwali season starts.

Worries for pepper exporters

THE trade in black pepper is unhappy that exports may not show a sign of revival in prices in the immediate future. World prices have been showing a downward trend for eighteen months and this has resulted in much lower earnings for exporters. The UK, West Germany and the Netherlands have cut their import requirements though the American demand has shown some growth. Brazil has been resorting to aggressive selling at lower and lower prices and the expectations are that its exports will reach an all-time peak of 32,000 tonnes in the 1981-82 season. The 1981-82 Indian season is only about six weeks away. The Brazilian offensive has forced India to withdraw so to say from the US and West European markets and increase its reliance on communist buyers. As many as 14,500 tonnes of black pepper out of the 16.790 tonnes shipped between November 1980 and May 1981 went to communist countries, the Soviet Union alone accounting for 12,647 tonnes. But exporters are concerned at the diversion on such a scale of this trade and would be happy to regain the western markets and not rely solely on the communist ones.

National policy for alcohol?

ALCOHOL-BASED industries in West Bengal hope that the Government of India has now fully recognised the need for a rational policy on alcohol. It is being pointed out that in the absence of such a policy while surplus states continue to hold stocks of alcohol industrial users, mostly in the deficit states, faced shut down and lay-offs. West Bengal industries have been gratified at the Centre's response to the representations made about shortage of alcohol and the Centre's subsequent action to issue import licences for a total of four million litres. The Alkali and Chemical Corporation of India's share of 3.2 million litres will enable the polythelene plant to operate for a month. It is in the context of this situation that the industries in West Bengal are demanding a fair and equitable distribution of the alcohol produced in the country. Diversion for potable uses it is suggested should not be at the cost of alcohol-based industries.

DHRANGADHRA CHEMICAL WORKS LIMITED

NOTICE

IT IS HEREBY NOTIFIED FOR THE INFORMATION OF THE PUBLIC THAT DHRANGADHRA CHEMICAL WORKS LIMITED PROPOSES TO MAKE AN APPLICATION TO THE CENTRAL GOVERNMENT IN THE DEPARTMENT OF COMPANY AFFAIRS, NEW DELHI, UNDER SUB-SECTION (2) OF SECTION 22 OF THE MONOPOLIES AND RESTRICTIVE TRADE PRACTICES ACT, 1969, FOR APPROVAL FOR THE ESTABLISHMENT OF A NEW UNDERTAKING FOR THE PRODUCTION, SUPPLY, DISTRIBUTION OR CONTROL OF 30,000 MT PER ANNUM OF WHITE CEMENT. OTHER PARTICULARS OF THE PROPOSED UNDERTAKING ARE AS UNDER:

(1) Name of the proposed undertaking : **DHRANGADHRA CHEMICAL WORKS LIMITED**

(2) Name(s) of person(s) or authority/authorities proposing to establish the new undertaking. Where it is a body corporate furnish details of its management structure together with those of the proposed undertaking : Dhrangadhra Chemical Works Limited which is managed by Managing Director under the supervision and control of the Board of Directors, namely:

Shri Sahu Shriyans Prasad Jain (Chairman)
Shri H. H. M. Sriraj Dhrangadhra
Shri A. K. Roy
Shri Gopaldas P. Parikh
Shri Dharma Vira
Shri Radhakrishna R. Ruia
Shri F. H. Tapia
Shri K. M. Philip
Shri Prem Chand Jain
Shri D. G. Ramaiah
Dr. G. P. Kane
Shri Gian Chand Jain (Managing Director)
Shri Shashi Chand Jain (Managing Director)

The new undertaking will be managed by the Managing Directors under the supervision and control of the Board of Directors. If necessary, a new Managing Director may be appointed to look after the new undertaking subject to the approval of the Government of India.

(3) Capital structure of the applicant person or authority and of the proposed undertaking :

SHARE CAPITAL:

Authorised Capital:		
1,00,000 Preference Shares of Rs. 100/- each	1,00,00,000	
2,50,000 Equity Shares of Rs. 100/- each	2,50,00,000	3,50,00,000
Issued, Subscribed and Paid up Capital:		
2,591—11% (subject to tax at source) Cumulative Redeemable Preference shares of Rs. 100/- each fully paid up	2,59,100	
25,000—9.5% (subject to tax at source) Cumulative Redeemable Second Preference shares of Rs. 100/- each fully paid up	25,00,000	
35,000—9.5% (subject to tax at source) Cumulative Redeemable Third Preference shares of Rs. 100/- each fully paid up	35,00,000	62,59,100
2,34,774 Equity Shares of Rs. 100/- each fully paid up	2,34,77,400	
Add: Forfeited Shares	200	2,34,77,600
		2,97,36,700
140—7.8% Cumulative Redeemable Preference shares of Rs. 100/- each not surrendered by shareholders for redemption		14,000
		2,97,50,700

(4) Proposed location of the new undertaking : Tehsil-Dhrangadhra, Dist-Surendranagar, State-Gujarat.

(5) Brief outline of the cost of project, the scheme and source of finance : Estimated cost of the project Rs. 450 lakhs. The project is to be financed partly from our own resources and partly from borrowings and deferred payments.

Any person insterested in the matter may make a representation to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this notice, intimating his view on the proposal and indicating the nature of his interest therein.

Dated: 31st August, 1981.

COMMODITIES

Cotton steady

Bombay, September 14

Quietly steady conditions prevailed in the spot cotton market during the past week with limited business passing. While there is expectation of cotton from Karachi reaching Indian ports in the next few days, there is as yet no clarification about the waiver of the import duty. The issue has been raised with New Delhi by those who have already booked some quantities. The efforts of the Indian Cotton Mills' Federation to win friends for Pakistan cotton have apparently been in vain as there has been no improvement in bookings.

The delegation that returned recently from Pakistan was back with the impression that Pakistan could, in fact, be tapped for more cotton if there is encouraging response from the Indian mills for the import of one lakh bales already agreed upon. The quality of cotton is said to be generally quite good and price attractive.

The Cotton Corporation of India, which has been assigned a significant role in cotton marketing under the integrated textile policy, has had a bad year. According to the latest report of its working for the year ending August 1980. it has suffered a record loss of Rs 13.65 crores. The CCI has conveniently attributed this loss to its fulfilling its social obligations.

Meanwhile, reports from Coimbatore say that there has been an improvement of nearly four per cent in the total production of all yarn at 1.59 lakh bales of 180 kg during July as compared to the normal monthly production. In relation to June, however, the increase is to the extent of 9.8 per cent. The estimated quantity of yarn available for the decentralised sector from the July production is placed at 1.04 lakh bales of cotton yarn 19,175 bales of viscose staple fibre yarn and 4,129 bales of blended.

Discussions on MFA negotiations are to be resumed in Geneva in the course of the next few days. Reports from Brussels indicate that the industrialised countries would refuse to negotiate on the basis of the proposals already submitted by the developing countries in July. Indications are that the protectionist postures adopted by the north will become more rigid, if anything, at the cost of the south.

The following is the trend of prices of some of the leading varieties :

(Rs. per candy)

	Septembet 4	August 28
Digvijay	...	...
Kalyan	4,650-4,800	4,650-4,800
Saurashtra CO2	4,800-5,050	4,800-5,000
Shankar 4	5,750-6,100	5,700-6,100
Maharashtra H 4	5,450-5,600	5,450-5,600
Maharashtra Varalaxmi	5,325-5,425	5,325-5,425
MP H4	5,300-5,450	5,300-5,450
MP Y1	5,000-5,050	4,900-5,050
MP 1007	5,150-5,250	5,150-5,250
MCU 5 Guntur	5,900-6,100	5,900-6,100

Downward trend in yarn

Bombay, September 14

A downward trend was noticed in the local yarn market during the past week. The prices of 150D NRC, 120D NRC, 150D CR and 120D CR declined by Rs 0.13, Rs 0.14, Rs 0.27 and Rs 0.51 to Rs 52.18, Rs 54.38, Rs 51.76 and Rs 54.56 respectively. The prices of 100D SIV and 150D acetate however, remained unchanged at Rs 61.67 and Rs 48.46 respectively.

Restricted activity in jute goods

Calcutta, September 7

Activity was somewhat restricted in jute goods in the Calcutta gunny market during the past week. Buyers were few and far between but prices advanced fairly moderately during the week mainly due to speculative activity.

At a recent technical workshop on jute held here it was pointed out that the industry has to play its role in increasing its competitiveness through adoption of aggressive cost reduction exercises. Intensive research and development are necessary to arrest the erosion of existing markets. Modification of existing constructions and development of diversified uses for jute are indicated.

The recommendations made by the workshop are of considerable interest. They are aimed at matching the quantity and quality of fibre with the production and demand of the industry. The attention given to the output of fibre is justified because a substantial development is envisaged in the field of raw jute. Production of fibre may have to be increased from the present level of eight million bales to nearly 12 million bales by 1985 if an output of more than 1.5 million tonnes of goods is to be achieved during the Sixth Plan.

The investors however feel that the implementation of the recommendations will take some time to produce results. They think that it will be prudent to concentrate attention on selected jute mills which have modernised their equipment and diversified the range of production in a large measure. This explains in a large measure, the interest evinced in Birla, Anglo India, Hukamchand and Fort Gloster Mills in the stock market.

The fibre market was steady partly reflecting some buying on account of the Jute Corporation of India. But the price of jute was maintained at Rs 231. per quintal throughout. It was reported that procurement of jute by the JCI is being hindered by the slow progress in distribution of jute cards among growers. Under a policy decision, the JCI should purchase jute only from card holders. There was no death of offers from growers but the JCI could accept them only in respect of those holding cards.

Tea : CTC fannings firm

Calcutta, September 7

At the weekly leaf tea auctions in Calcutta the offerings of 27,610 packages of CTC teas met with good general demand. Dooars brokens met with good inquiry from the Gujarat and Punjab buyers. The major blenders also lent useful support. The USSR was active for grainy better made brokens. There was selective inquiry for the better sorts from the gulf buyers. All CTC fannings met with better demand and sold at firm to dearer rates. The blenders and the ARE were fairly active. There was some inquiry from the UK shippers. The Punjab and Gujarat buyers optrated for the Dooars descriptions.

The 9,703 packages of Darjeeling teas offered met with better demand. The clean Darjeeling whole leaf grades met with better demand from the USSR and realised fully firm to dearer rates. The other traditional exporters operated selectively. Bolder varieties were also well absorbed by one of the blenders and their prices were steady. Better brokens came to a firm market, being readily absorbed by the USSR for the larger varieties with support from the UK and internal buyers. Poorer sorts tended slightly easier. Fannings followed a similar trend being absorbed by one of the UK buyers and the local dealers.

The 57,529 packages of orthodox teas offered met with good demand. Plain and medium brokens met with good demand and sold at fully firm rates. The USSR was active with Poland lending fair support. There was selective inquiry from Iran for the better lines on offer. Better whole leaf grades sold at barely steady rates. The USSR continued to dominate the market with some support from Iran for the better sorts. Medium and plain descriptions met with reduced inquiry from Afghanistan and sold at barely steady levels. Fannings met with good demand from the ARE and the major blenders and sold at firm rates.

The 19,335 packages of dusts offered at the sale met with a good demand. Assam CTC dusts met with good inquiry from the blenders and the western India buyers. There was also useful support forthcoming from the local Calcutta buyers for the small descriptions. The ARE operated. Dooars dusts were well supported by the blenders, ARE and internal buyers. Exportable Pekoe dusts met with good support from the UK buyers and the blenders. Orthodox dusts met with good demand from the blenders and ARE with selective inquiry from the internal dealers.

Weather conditions in most tea growing districts remained favourable throughout the week and leaf intake was reported to be good. Growing conditions in Upper Assam, Sibsagar and Jorhat districts have been extremely favourable during the last fortnight and the crop during the latter half of August has been reported to be satisfactory. Cachar, however, reported a slight set back and leaf intake has been slightly lower than at the same time last year.

With orders not forthcoming from outmarkets and uncertainties of getting payments inhibiting an exporter from accepting orders from a third source, the outlook for packet tea exports as of now is far from promising. The loss of orders from three sources can easily be placed at around nine million kg and if one is to go by the indications available with the segment of the packet tea export trade, which usually services orders from these

DHRANGADHRA CHEMICAL WORKS LIMITED

Grains steady

Bombay, September 14

A steady tendency featured trading in the local grains market during the week under review.

In cereals, wheat (superior) ruled steady at Rs 270-295 per quintal on good inflow. Demand was slack. Advices from the producing centres were subdued. Buyers were cautious. The Saurashtra variety hardened by a rupee at Rs 210-235 per quintal.

Activity in rice was restricted. Owing to the fag-end of the season buyers were reserved. Arrivals averaged 1,200 bags mainly from the South. Export demand was slack. The basmati variety was steady at Rs 500-700 per quintal and Surti Kolam was quoted at Rs 340-400 per quintal.

In coarse grains, business was poor because of limited arrivals. Prices ruled steady. Jowar was traded at Rs 190-235 per quintal, bajra at Rs 190-250 per quintal and maize at Rs 185-190 per quintal.

Among pulses, gram increased by rupees eight to Rs 390-405 per quintal. Arrivals averaged 200 bags per day. Masoor dal firmed up by Rs 15 to Rs 485-495 per quintal. Moong receded by Rs 45 to Rs 400-410 per quintal on comfortable inflow of new crop, averaging 800 bags per day. Tur dal and urad (Khandesh) maintained last week's levels of Rs 450-575 per quintal and Rs 310-315 per quintal respectively.

Sugar recovers

Bombay, September 14

The decline in prices in the preceding week was reversed when prices moved up as up country buyers became active. The price of sugar C-30 firmed up by Rs 26 to Rs 542-565 per quintal. Firm offerings on account of depleted arrivals pushed up the prices. The weekend stocks improved from 1,111 bags to 3,354 bags. The price of C-30 as on September 12, was lower by 296 per quintal than the corresponding price a year ago.

Trading in Khandsari was restricted. The weekend stock was placed at 603 bags.

Mixed trend in foodgrains

Hapur, September 14

Mixed conditions were witnessed in foodgrain market during the past week. Wheat and maize recorded fresh gains while gram and rice sought lower levels. Standing kharif crops mainly juwar, guwar, bajra, munji and maize were adversly affected due to continued drought conditions.

Wheat hardened by Rs 5 to 10 per quintal on brisk Delhi support in face of poor receipts. Wheat average was now placed at Rs 137-148 and white farm between Rs 150-155 per quintal. Daily arrivals averaged 400 quintal.

Rice market, however, ruled easy on poor buying support and fresh arrivals from producing areas of Gangapar district. Standing munji and paddy crops were now reported uncertain due to failure of monsoon. Weekend prices were : Basmati sela Rs 475-500; mainpuri sela Rs 260-265; gadda Rs 220-222 and munji Rs 115-125 per quintal.

In coarsegrains, gram prices further declined by Rs 5 per quintal on easy advices from Haryana, Punjab and Rajasthan. Demand too reported slack. Gram was now quoted at Rs 320-360 per quintal according to quality. Maize, however, ruled steady on good demand for feed purposes. Some demand was also reported from Bihar and Delhi side. Prices moved up by Rs 2 per quintal to be quoted now at Rs 130-137 per quintal according to quality. Barley ruled quiet while bejhar tended to ease on poor buying support. Other coarse cereals prices were almost listless in limited trading.

In pulses peas ruled steady on slack buying and some demand from millers for conversion into dal. Peas dara was now quoted at Rs 350-360 and white farm at Rs 370-400 per quintal. Arhar, urd and other dal prices were almost stationery as trading was at a low ebb. Weekend prices were :—Barley Rs 118-125; bejhar Rs 130-137; juwar Rs 180-200; guwar Rs 270-280; methi Rs 300-325; oats Rs 220-230; peasdal Rs 475-490; arhar Rs 250-300; dal Rs 400-425; urd Rs 290-295; dal Rs 335-350; moong Rs 325-340; dal Rs 430-440; masoor Rs 335-350; dal Rs 440-450 and gramdal Rs 440-460 per quintal.

Downtrend in metals

Calcutta, September 7

A downward course in prices marked trading in the non-ferrous metals market in Calcutta during the past week as bullish pressure weakened in the wake of discouraging advices from abroad and further deterioration in the power situation in West Bengal which has nearly paralysed industrial output in the medium and small scale unit.

Seasonal slackness in upcountry demand and fairly regular releases by the canalising agency, Minerals and Metals Trading Corporation, partly accounted for the downtrend. However, releases of indigenously produced metals were again disrupted by the power cuts imposed on smelters located in Rajasthan, according to industry sources.

Among the virgin metals, copper ended the week on a quietly steady note with the wirebar unchanged at Rs 3,600 a quintal. Speculation was rife in market circles on the prospect of a hike in MMTC's selling prices. On the London market, copper drifted lower due to commission house liquidation.

Zinc electrolytic ingot closed the week in local trading at around Rs 1,900 a quintal despite poor industrial demand. The worsening power situation has hit galvanising activity in the State. The offtake of alloy manufacturers was also negligible. However, scattered bullish support was in evidence. On the IME zinc followed copper under speculative liquidation.

In moderate trading, lead ingot finished the week at Rs 1,380 a quintal but the volume of business in physical metal was restricted by poor consumer support.

Gold and silver up

Bombay, September 14

A modest rise in gold and buoyancy in silver marked the trading in the Bombay bullion market during the past week.

Standard mint gold which opened at Rs 1,752 per 10 gms increased further to close at Rs 1,755 per 10 gms. Ready silver (.999 fineness) opened at Rs 2,730 per kg and short up to Rs 2,790 per kg before closing at Rs 2,770 per kg.

Money stringent

Bombay, September 14

Conditions were tight in the Bombay short-term money market during the past week. Interest rates oppened at nine per cent and fluctuated between nine per cent and ten per cent. The market closed at ten per cent.

Aggregate deposits cross Rs 41,000-crore mark

Bombay, September 14

With the increase of Rs 85.15 crores, aggregate deposits of all scheduled commercial banks crossed the Rs 41,000-crore mark to reach Rs 41,073.11 crores during the week ended August 4, 1981. Bank credit contracted by Rs 26.44 crores to Rs 2,676.37 crores. Banks' balances with the Reserve Bank of India (RBI) increased by Rs 211.04 crores to Rs 4,754.36 crores and their borrowing from the RBI increased by Rs 13.56 crores to Rs 575.16 crores.

Bank funds for rural development

By NAVIN CHANDRA JOSHI

THE Estimates Committee of Parliament has in a recent report deplored the continuing reverse transmission of funds from rural branches of banks to the urban and metropolitan centres. The Committee has regretted to note that the credit-deposit ratio in rural areas continues to be unsatisfactory. This has happened in spite of the fact that the public sector banks were advised to step up disbursal of credit through their rural and semi-urban branches to achieve a credit-deposit ratio of at least 60 per cent by the end of March, 1979. The Committee has therefore asked the Government to take urgent steps to arrest the trend of reverse transmission of funds by rural branches so that funds generated in rural areas are deployed largely for the development of these areas.

It is now almost a decade since we started with the experiment of financing priority sectors in our rural economy. With increased emphasis placed on growth through agriculture, rural credit became the kingpin of development in its catalyst role. The rural leadership today complains that commercial banks do not handle effectively the whole complex of bank credit to meet the demands of the major portion of the rural population. The low credit-worthiness of the poor comes in the way of its meeting genuine needs from banks. Besides, the needs of rural population are so many that they call for a co-ordinated package deal by both the financial institutions and other government agencies, not just the grant of credit. Perhaps, the whole power structure in our villages needs to be changed in favour of the weaker sections.

The present position of rural leadership has helped perpetuate the feudal system in rural areas. Consequently, the benefits from banks could not reach the classes that were intended to be benefited after the nationalisation of the major banks. Commercial banks, on their part, have been trying to metamorphise the rural scene by involving themselves in village development. It must also be said that there have been quantitative achievements in some directions but as the rural scene is not so simplistic, it needs much more effective, sustained and consolidated programmes in an integrated manner.

Studies on farm loans have revealed that bank loans are repaid sooner and with more consistency by the socially depressed groups than by higher caste and rich farmers because the latter believe that they can get away with it. The village moneylender still has his influence and hold over small farmers and poor farm labourers some of whom do not get liberated from the burden of loans. The government should think of some ways by which such persons are freed from the clutches of moneylenders. Funds provided by the rural co-operative sector have also gone to rich farmers. No wonder that the moneylender has dominated the rural finance scenario even though he acts with dishonesty and charges very high rates of interest. The bane of the co-operative movement in the country has been that its benefits have been cornered by a privileged few who controlled the co-operative societies, depriving the less privileged members for whose benefit the movement was actually started.

In the above context, diversion of rural deposits to urban centres is quite deplorable though its impact would be felt only after some years in the form of low growth in rural areas. The diversion has also caused a reduction in banks' lending in rural areas and as such, the credit-deposit ratio for the banking industry as a whole has fallen in recent years. The Estimates Committee has made a useful recommendation that surveys to quantify the credit needs of rural population be conducted every five years so that the information collected could be utilised while drafting five year plans.

It may be noted that, while for big farmers credit may be a useful adjunct to their owned funds, for small and marginal farmers it is of overriding importance for the growth of agricultural productivity. Such credit cannot be obtained from the usual market sources. Loans from moneylenders entail a high rate of interest and small farmers cannot afford to pay it. In our economy, the mark rate of interest is not independent of t profitability of investment. If the fa mers, taking advantage of high rate return on investment, decide to borro from the market sources, the rate of int rest thereof may very soon chase t rate of return and thus increase t burden of other compulsive loans li the one incurred for consumption. P vate moneylenders deliberately e courage default so as to take over t land which is the usual security.

It may be emphasised that far financing is essentially a supervis credit. Supervision should form essential ingredient from the time disbursement of a loan till it is repai It is in the interest of both the bar and the borrower that the loan is utilis for the purpose for which it is mear Farm finance is, in fact, an activi which has a definite socio-econom function to perform. While a lar section of farmers belong to the cat gory of small and marginal farme there are about eight crores of agricu tural labourers in the country. The interest could be safeguarded by bank involving themselves in schemes lik SFDA/MFALDA, 20-point econom programme, DRI and such other schem as formulated by the government fro time to time for helping the rural poor

Another important aspect in rur finance is that there are at present number of sick units in the rur sector. They are in utter need financial and other assistance. Th term-lending institutions do not part cipate in rehabilitating them unless involves fresh capital investment programme and even then their assistanc is restricted to acquiring fixed assets. I other words, banks are not stepping merely because there is a need for long term funds. Hence, they nee active co-operation of term-lendin institutions (development banks) fo putting sick units back on their fee as the problem has now assumed gigantic proportions.

Without belittling the variou efforts of the Government and the banking sector, it would be right to say tha the endeavours made so far have no touched even the outer fringe of th rural population. It is high time tha our banks are used as social instrument for accelerated economic progress an surely, in the rural sector this objective can be achieved through agricultura finance and its optimal deployment fo rural growth.

Mr Joshi teaches at Motilal Nehru College, University of Delhi.

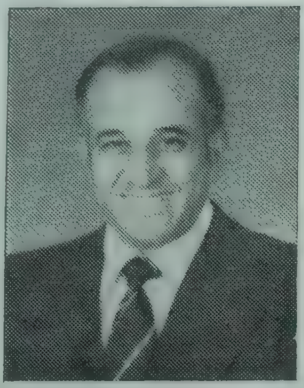
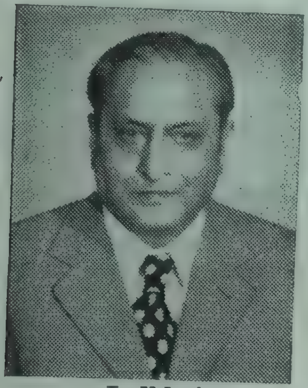
PEOPLE

Mr Chandrakant C. Sheth has been elected president of the Bombay Fountain Pen Manufacturers and Traders Association.

Mr K. Rajagopal, managing director of Lakshmi Mills Co Ltd, Coimbatore, has been re-elected chairman of the Indian Cotton Mills' Federation for the year 1981-82. Mr Rajagopal, who has a B.S. (Textiles) from the Philadelphia College of Textiles and Sciences to his credit, is also currently connected, as director, with several textile units.



Rajagopal



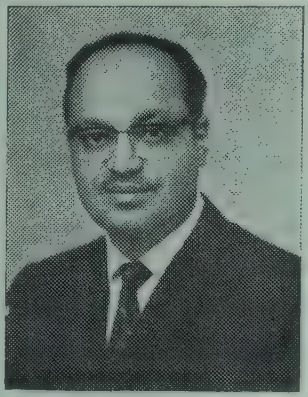
Lalbhai

Mr M. K. Bagai has taken over as marketing director of Hindustan Petroleum Corporation Ltd.

Mr Arvind Narottam Lalbhai, managing director, Arvind Mills Ltd, has been re-elected deputy chairman of the ICMF. Mr Lalbhai is also president of the Federation of Indian Chambers of Commerce and Industry. He headed the Ahmedabad Millowners' Association thrice and has been on the managing committee of several public and professional institutions.

Mr S. K. Ojha, president, Kesoram Spun Pipes & Foundries, has been elected chairman of Cast Iron Spun Pipe Manufacturers' Association.

Mr Kantikumar R. Podar has been re-elected vice-chairman of the ICMF. Mr Podar, who had been chairman of the Millowners' Association, Bombay, from 1976-78, was Sheriff of Bombay in 1974 and is on the committees of the All India Association of Industries, FICCI, and Maharashtra Labour Welfare and National Labour Institutes.



Podar

Adya

Mr Varadaraj Adya, vice-president, Personnel and Public Relations, Mafatlal Fine Spinning and Manufacturing Co Ltd, Bombay, has been elected chairman of the Audit Bureau of Circulations for 1981-82. Mr P. K. Roy, Mr S. R. Ayer and Mr N. M. Dugar were elected respectively deputy chairman, honorary secretary and honorary treasurer.

Mr B. K. Kedia, executive director, Raymond Woollen Mills Ltd, has been re-elected chairman of the Indian Woollen Mills' Federation for 1981-82.

Dr Prakash M. Parkhe, joint managing director of Paper & Pulp Conversions Ltd, Pune, has taken over as managing director. Dr Parkhe is also a member of the executive council of the Mahratta Chamber of Commerce and Industries.

Parkhe

THE WEEK

Six European shipping lines have formed a c sortium styled "COBRA" (Continental and Brit lines), to operate from November 1 this year a fo nightly container service on a liner basis on the Ind UK-Continent route. The consortium will ope compete with Indian Containers Ltd (ICL) comprisi the Shipping Corporation of India, the India Stea ship Company and the Scindia Steam Navigati Company.

The Union cabinet on September 18 fixed t procurement price of paddy for the forthcoming kha crop (1981-82 marketing season) at Rs 115 per qu tal as recommended by the Agricultural Prices Co mission.

★

The Union Government has set up Cement Pri rity Committee to allocate cement among the vario priority sectors such as coal, petroleum, steel, irrig tion and power. The committee is headed by Mr S. I Ghosh, Secretary in the Department of Industri Development, and will start functioning from Oct ber 1.

★

India and Botswana have signed a memorandu of understanding in the field of economic develo ment, particularly in the development of small sca industries. India would assist in the establishment a comprehensive structure for the development small scale industries.

★

The Union Finance Ministry has exempte cotton from import duty with effect from Septemb 21, 1981. About 50,000 bales of cotton are to be im ported immediately from Pakistan.

★

The Union Government has permitted the Ste Authority of India to import, as the canalising agency two lakh tonnes of pig iron under the buffer scheme The first instalment of imports is expected by Nov ember end this year.

★

Industrial production in India has registered growth rate of 11.1 per cent in the first quarter of th current year, according to Union Industries Minister Mr N. D. Tiwari.

★

The Union Agriculture Ministry has earmarke Rs 111 crores for immediate distribution as short-term loans to states for purchase and distribution of agri cultural inputs like quality seeds, chemical fertilisers and pesticides.

★

The Government has sanctioned a loan of Rs 18 crores for the Rural Electricity Corporation for 86 new projects which will help electrify 1,600 villages in 12 states.

★

Wholesale price index

At 284.8, the latest available wholesale price index for the week ended September 5, 1981 showed a decline of 0.5 per cent over the preceding week. However, at this level the index was higher by 8.9 per cent than its level a year ago.

Money stringent

Conditions were comfortable in the Bombay short-term money market as of Monday (September 21, 1981). In the inter-bank call section, both notified and commercial funds were renewed at 9.5 per cent and 9 per cent. Fresh money was transacted at 9 per cent. The market closed at 9 per cent

COMMERCE

American domination of World Bank

THE US Government has all along played a disproportionately dominant role in the affairs of the International Bank for Reconstruction and Development, popularly known as the World Bank, right from its inception in the mid-40s. At the end of June 1981 the US Government's subscription to the capital stock of this Bank stood at a little over 23 per cent and it provided a little over 17 per cent of the borrowings by the Bank. The US contribution to the working of the IDA, the World Bank's soft-loan affiliate, which has played a positive role in the economic development of the poor countries, was more substantial, as it provided about 31 per cent of the total subscriptions and supplementary resources. The President of the World Bank has invariably been an American citizen. The World Bank has very much responded to the inclination of the US Government and also of the American President of the Bank. The US has got more from the world bank than it has given. A new dynamism was injected into the working of the World Bank by Mr Robert McNamara, who retired as President earlier this year. He gave a direction to the working of the World Bank which made it more relevant to the interests of the poor countries and their poorest citizens than the Bank's working had been at any time before. It is no surprise that the World Bank has come to evoke new hopes from the poor countries. However this happy turn seems to have come to an end.

The change of the presidentship of the Bank, which is now headed by Mr A. W. Clausen, who left his number one position in the Bank of America to head the World Bank, has already made its impact felt to the utter disadvantage of the poor countries. There is no doubt, however, that the sudden stinginess displayed by the US Government in providing funds to the World Bank has been a factor in this deterioration. The US contribution of $ 3,240 million to the sixth replenishment of the International Development Association will be paid in three instalments—but not in equal amounts but only $ 540 million would be made available in the first year, $ 850 million in the second year and the balance $ 1,850 million in the third year.

As a result, the IDA concessional lending will have a more restricted role in the first two years than it really needed to be. This would increase the reliance of the borrowing countries on the more expensive World Bank loans to make up for the reduced share to IDA finance. The World Bank has already raised the lending rate thrice during 1981. The lending rate is now 11.6 per cent. There is a threat that the lending rate may still be further enhanced. The Reagan Administration was reportedly considering a proposal to cut US contribution to the international lending organisations like the World Bank starting from 1984 and to bring about a thorough overhaul of their lending policies. The USA might make a bid to eliminate the IDA after 1984. The draft proposals—the result of a seven-month study—also affect the Asian Development Bank and other international financial institutions. The US Government under Mr Reagan and, following him, Mr Clausen, the World Bank President. are of the opinion that the developing countries should obtain funds for development from the capital market. The point is that if the developing countries could afford the high cost of borrowing from the capital market they would not have looked up to the World Bank for funds and such advice would be redundant. Without that capacity to borrow from the capital market the suggestion comes as a great affront.

The *World Development Report* 1981, published by the World Bank in August, noted that the growth of the developing countries in the eighties would depend, among other factors, on "their ability *to increase the inflow of external capital* and to raise the rate of domestic saving in order to finance investment aimed at restructuring their economies." (Italics added) From where are the developing countries to get capital, if not from the developed countries of the rich West including the USA and the West European countries? At constant prices the oil importing developing countries have been able to effect savings at the rate of about 20 per cent of the GDP during the seventies. According to the projection of the World Bank, the utmost these countries may be able to do in the field of saving during the eighties would not be significantly different from what they have achieved (21.4 per cent) in 1980. Thus the main thrust has to be towards obtaining external capital.

The Foreign Minister of Sweden told the United Nations Conference on the Least Developed countries in Paris earlier this month, "The least developed countries are faced with an international economic situation they themselves neither caused nor can do much to influence. And these are the very countries that can least afford to cut back programmes against poverty and hunger". This is the reality. Logically enough, the Swedish Foreign Minister correctly noted the obligation of the two economically most powerful countries—the USA and the USSR—to come forward to help the poor countries, "A special request must be directed to the United States and the Soviet Union. At a time when the least developed countries are faced with an increasingly disastrous situation, the two super-powers are engaged in a race for military superiority", the Swedish Minister noted.

India faces the unenviable need to divert more funds for defence—primarily because of the infusion of the arms race into neighbouring Pakistan. The costly mistakes in China and subsequently in Vietnam have not, apparently, taught the US Establishment any lesson so that it has embarked upon another arms race in Asia. If, instead of providing F-16 planes which can do no good to the poor in Pakistan, the US Government had provided Pakistan with development assistance it would have brought about a degree of welfare which is otherwise just inconceivable. The question must be faced: Why should USA time and again inject strife and instability in South Asia, where the largest number of the world's poor live? The US military budget, as the Swedish Foreign Minister so relevantly pointed out in his address, is almost ten times higher than the official development assistance (ODA) provided by all the countries of the Organisation for Economic Co-operation and Development (OECD). There is no doubt that the same relationship exists in the Soviet Union. This also underlines the obligation of the Soviet Union to provide larger funds for the development of the poor countries by joining the World Bank and actively assisting the replenishment of IDA.

The rate of growth of individual countries is important. For on the attainment of a satisfactory rate of growth alo depends the possibility of the developing countries com out of the morass of poverty and underdevelopme However, any programme of action for the betterm of the developing countries must take into accou the growth rate over a period longer than one ye For example, if in one year a country has a poor rate growth, even the normal rate of growth in the subseque year may show a very high rate of growth, although for t welfare of the people of the country the so-called high-ra of growth may mean little. On the other hand, even a lo rate of growth in a prosperous economy may bring in a f greater degree of welfare to the people in that country. T World Bank's factual statement in the annual report for t fiscal year 1981 that the economic growth during 1980 in t developing countries outpaced growth in the industrial cou tries by more than three-fold needs to be evaluated in th light. As is well-known, the distance between the prosperi of the developed countries and that of the developing cou tries has been widening, which means that the develope countries have been growing faster than the developin countries. This is why India should play an aggressive ro at the forthcoming Fund-Bank annual meeting to combat th anti-poor world American domination of the World Bank

Textiles : Fortunes slump again

ONCE again the fortunes of the cotton textile industry have slumped after a comparatively prosperous brief respite of three years. According to Mr K. Rajagopal, chairman of the Indian Cotton Mills' Federation (ICMF) most of the mills are currently exposed to cash losses with realisation on sales of cloth and yarn lagging considerably behind the cost-push. The reasons are not far to seek. The industry's principal raw material has become costlier with cotton prices having shown a smart rise of nearly 37 per cent in January to June this year over the corresponding period of the previous year. The multi-fibre policy implying part use of man-made fibres for cotton has also not worked satisfactorily with industry complaining about costlier indigenous fibre and still more costlier imported fibre. Inflationary pressures have meant that the industry has been forced to pay higher and higher dearness allowance to its employees, pushing up the wage costs. Coal, fuel, oil and electricity charges have been raised by the authorities and chemicals and stores have become dearer too. The cost of production of cotton cloth in Bombay mill industry has reportedly risen by as much as 26 per cent during the current year compared to only 8.50 per cent in 1980 over 1979. The private mills have been freed from the controlled cloth obligation but the industry as a whole subsidises the scheme to the extent of over Rs 100 crores, of which Rs 80 crores to Rs 85 crores come from the cotton mills alone through the 15 per cent *ad valorem* surcharge on excise. True, cloth prices have risen and th common man nurses a grievance about them and rightly too But according to industry prices have not kept pace with rising cost of production partly because of the resistance tc higher prices of cloth itself and partly because the common man has to pay higher prices for other daily necessities.

The cotton balance-sheet for the season that has begun last August does not look a healthy one. The carryover has been just 13.50 lakh bales, which is a much short of three months' estimated requirements of mills of 20 lakh bales. The season's yield is also not placed beyond 80 lakh bales and the supply position promises to be tight. Consequently cotton prices should continue to be firm unless there are imports of short and medium staple cotton and the industry can make greater use of long staple cotton. Unfortunately, finer cottons are now being exported with mills not lifting their stocks and growers of such variety as Suvin suffering in the process. The industry has a grievance that the structure of excise duty on fabrics creates hurdles with the levy rising sharply as the average count of cloth rises beyond 40s. This may not be the whole explanation but the complaint of the industry must be examined carefully by the Government for the same volume of finer cotton yields larger metreage of cloth. Mr Rajagopal has drawn the pointed attention of the Government to the recommendation of the Jha Committee on Indirect Taxes that a tax on cotton fabrics should be based on the price before tax, with the least rate of tax to be applied to the cheaper varieties of cloth.

The cotton textile industry has been planning its rehabilitation and modernisation of obsolete machinery for a long time but apparently not much progress has been made. Modernisation has been considered essential from export point of view but more efficient machinery is equally important if the industry is to have some sort of check on rising costs of production. As Mr Rajagopal has commented it is rather sad that, in the year of MFA negotiations, India's fulfilment of quotas of fabrics to the EEC and the USA has woefully lagged behind. This is not all. Exports of cotton cloth during 1980-81 were of the order of only 300 million sq metres, the lowest in several decades, though exports of cotton textiles including garments and hosiery goods, rose, as Mr Rajagopal pointed out, from Rs 786 crores in 1979-80 to Rs 874 crores in 1980-81. Exports need to be diversified, particularly into the field of blended and synthetic items but this will not be possible till modernisation for the entire industry is complete or we develop at least a few fully export-oriented mills. Mr Rajagopal has complained that the Industrial Development Bank of India has virtually withdrawn its soft loan scheme and that the hike in interest charges for term loans has also given a setback to the mills' modernisation tempo. He has proposed that the least that the authorities could do to gear up the pace of modernisation to is to restore the original scheme of soft loan scheme, with the concessional rate of interest as an important component and financing of overrun in project cost in a realistic manner. This is rather too much to expect from the IDBI particularly when the financial institutions are suffering from constraints of finance. But the Government must find a way out as in the face of widening trade gap year after year, textiles, as the chairman of the ICMF has said, could be one of the leading items in our efforts to augment the foreign exchange resources. (See also page 553).

Salem : A white elephant ?

THE Steel Authority of India (SAIL) can take some comfort from the fact that the first stage of Salem Steel Plant to produce annually 32,000 tonnes of cold rolled stainless sheets was commissioned on time on September 13. But 54 months was a long lead period and the first stage, though commissioned in this lead time, has taken 11 years to materialise since the Prime Minister, Mrs Indira Gandhi, inaugurated the work for an integrated flat rolled stainless steel plant in 1970. Some misgivings have been expressed on whether the Government would develop the Salem plant into an integrated one and the assurance of Mr A. S. Gill, secretary to Ministry of Steel, on the occasion of the inauguration of the cold rolling mill should serve to clarify the Government's intentions. Mr Gill has asserted that the Government was serious in implementing the Salem steel project in the form of an integrated steel plant as originally conceived.

Apart from the completion of the first stage on schedule two other favourable points deserve to be mentioned. First, as Mr K. C. Khanna, chairman of SAIL pointed out, taking into account the addition to the scope of the plant the revised estimate of Rs 167 crores with the earlier estimate of Rs 127 crores could not be called unreasonable. So there were no overruns in costs which are normally associated with public sector projects. Secondly, there has been no surplus labour employed which is the malaise with the earlier five integrated steel plants. The argument has always been that the employment provided should be in proportion to the huge investments made which, in a country like ours, with so many millions unemployed, looks reasonable. But the surplus staff unnecessarily pushes up the cost of production of steel without bringing in efficiency, and Salem seems to have learnt the lesson. It has a work force of not more than 1,000 with 600 of them in plant proper. The steel plant can of course contribute indirectly to employment through the downstream units which can convert into the end-products the stainless steel produced by the plant.

But all these factors cannot outweigh the fact that Salem promises to be a white elephant from the word 'go'. Currently its production is based on imported hot rolled coils on which the customs duty is as high as 325 per cent. On this basis the cost of production would work out to Rs 83,000 per tonne as against the market price of cold rolled sheets of Rs 56,000 per tonne. The annual loss on the production of 32,000 tonnes would run into as much as Rs 86 crores. Mr Khanna has explained that the original plan for Salem was drawn when the import duty on hot rolled coils was only 75 per cent, and SAIL has represented to the Government to substantially reduce the burden of customs duty. The Government could accede to the request fixing a duty of 75 per cent on hot rolled coils imported by SAIL just as in the case of edible oils there is a substantial difference in duty on oils imported by the STC and those imported by the private trade. In this connection it has been proposed that the slabs produced by continuous casting process by Durgapur Alloy Steel Plant could be rolled into hot rolled coils at Bokaro and supplied to Salem for cold rolling. Its economic implications have apparently to be studied. But it is equally important that dependence on imports for Salem has also to be avoided. As suggested by SAIL also, the Government must immediately stop imports of finished cold rolled products so as to help create demand for Salem products.

Leap into the steel age

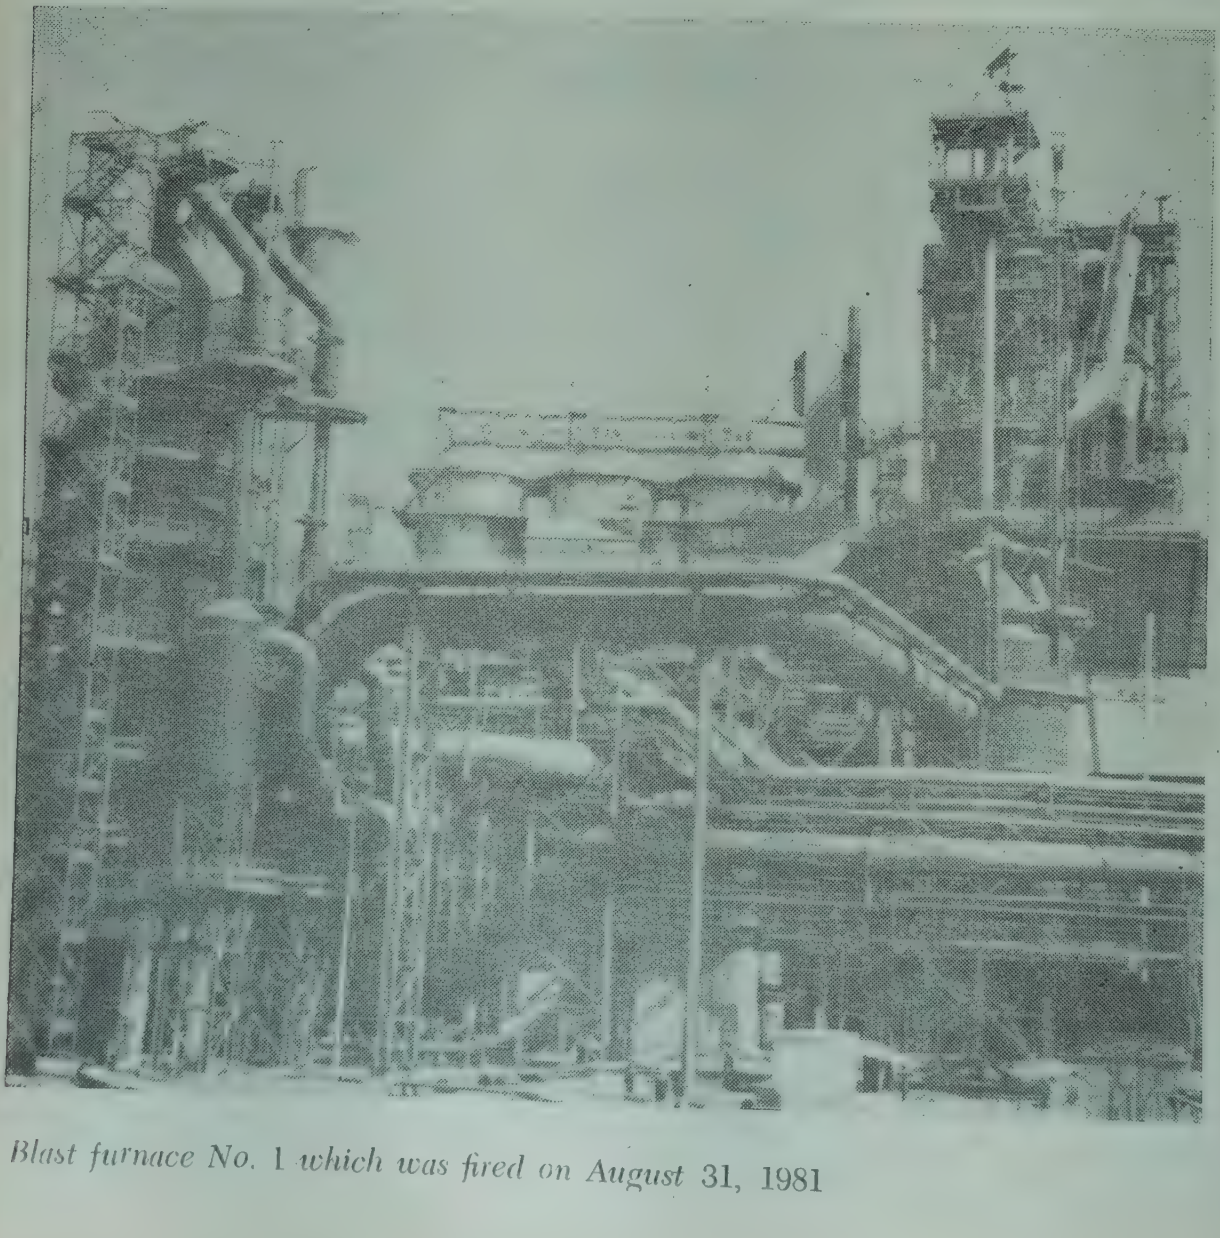
By KHALIQUE ZUBERI

PAKISTAN entered the group of world steel producers with the inauguration of the first blast furnace of the Pakistan Steel Mills on August 31, 1981. The occasion coincided with the 34th anniversary of independence. The inaugural ceremony was performed by President General Mohammad Zia-ul-Haq, who described the commissioning of the project as an important milestone in the economic development of the country. The President emphasised that if Pakistan lagged behind in the development of science and technology, the coming generations would have to suffer.

Being a basic industry, the development of allied and auxiliary industries was a natural consequence which would, in their own manner, contribute to national economic development. He said the occasion marked a beginning towards self-reliance.

Pakistan Steel entered the operational phase on April 17, 1981 when the first battery of coke oven, a by-product plant consisting of 49 ovens was charged with coal and the first lot of coke was taken out on April 18. The thermal power plant (first turbogenerator) has been commissioned and has attained a load of 55 mw from April 15. Since Pakistan Steel's present internal requirement is 5 mw, the balance is being transmitted to Karachi Electric Supply Corporation for use by industrial and domestic consumers of Karachi city.

This project of national importance has had already a visible impact on certain areas of economic activity connected presently with construction and fabrication industries. When the plant goes on full stream in 1984, the economic impact of it, as a result of easy availability of basic inputs of iron and steel products, will be widespread and multi-dime
sional. Pakistan Steel will not only p
duce 1.1 million tonnes of steel
annum according to its designed capac
but will also provide a number of b
products.



Blast furnace No. 1 which was fired on August 31, 1981

In addition, valuable by-produc
like gases for generation of power, am
nium sulphate as fertiliser (17,000 to
nes), coal-tar (46,500 tonnes) and benz
will be available. A carbon black pla
which will use coal-tar has already be
constructed adjacent to Pakistan Ste
The plant is now operational. Slag w
be used by Thatta cement factory f
production of slag cement.

The steel mills has in-built capaci
for expansion to two million tonnes. I
steel industry the economics of produ
tion works as a rule of thumb. Tha
would mean that the higher the produ
tion, the lower would be the cost
production. The expansion in capacit
has been provided in the design. Initial
ly two blast furnaces are to be set u
for one million tonne capacity but th
third and fourth can also be set up a
an extension of the existing two wit
much reduced expenditure. The capa
city expansion has been strongly recom
mended by experts. The economical siz
of a steel mills is four to five millio
tonnes. In case of Pakistan where pe
capita steel consumption is nine kg a
compared to Asian average of 55 kg and
world average of 106 kg, two millio
tonnes capacity is at present regarded
feasible, but demand would increase.

Pakistan has opted for the blast furnace and LD converter process in producing steel because of the well established familiarity of this process and large scale usage all over the world. The blast furnace process is of Austrian origin which was started there in 1953. In Japan about 80 per cent of steel is produced through this method. The still more modern method is the direct reduction process which is now being adopted by countries like Saudi Arabia, Venezuela, Iran and Mexico. This is the German process and its main source of energy is gas. This system works on electric arc furnaces. In 1978, out of 752 million tonnes of steel produced all over the world, only 12 million tonnes was

World Bank and IDA operations: 1980-81

By **COMMERCE RESEARCH BUREAU**

DURING the fiscal year 1980-81 lending and investment commitments by the World Bank and its affiliates, the nternational Development Association (IDA) and the International Finance Corporation (IFC) aggregated to $13,102 million. These were higher by $ 940 million or 8 per cent against the previous year's total of $12,162 million.

Lending commitments approved by he World Bank rose by $1,165 million or 15.2 per cent in 1980-81 to $8,809 million from $7,644 million in 1979-80. These were in support of 140 projects in ifty countries.

During 1980-81, development credits approved by the IDA fell by $356 million or 9.3 per cent to $3,482 million s against $3,838 million in 1979-80. A otal of 106 projects for 40 countries vere approved during the year.

The IFC approved 56 investments vorth $811 million to 34 countries luring 1980-81, compared with 55 investments worth $681 million in the preceding year. These were higher by 130 million or 19 per cent over those n the preceding year.

The World Bank and IDA together isbursed assistance worth $6,941 million uring 1980-81, up $1,197 million or 21 er cent compared with $5,744 million he previous year. Of this, 73 per cent r $5,063 million were disbursed by the World Bank and 27 per cent or $1,878 million by the IDA.

Regional distribution

Of the total assistance approved y the World Bank and the IDA during 980-81, nineteen countries of Latin merica and the Caribbean accounted or $3,153 million or 25.7 per cent of he total assistance and ranked first ollowed by six countries of South Asia $2,531 million or 20.6 per cent); hirteen countries of Europe, Middle ast and North Africa accounted for 2,436 million or 19.8 per cent of the tal World Bank group assistance and n countries of East Asia and Pacific gion for $2,358 million or 19.2 per nt. Other beneficiaries were sixteen untries of Eastern Africa ($938 milon or 7.6 per cent) and seventeen untries of Western Africa ($874 illion or 7.1 per cent). In all 81 member countries received assistance during 1980-81 (Table 1).

In percentage terms the largest share of World Bank assistance went to Mexico which received 12.3 per cent or $1,081 million followed by Brazil 9.6 per cent or $844 million and Turkey 8.2 per cent or $722 million. The share of China which joined the World Bank group during May 1980 was only 1.1 per cent or $100 million.

India was the biggest borrower from the IDA in 1980-81 with $1,281 million. Next came Bangladesh ($334 million), Pakistan ($202 million), Arab Republic of Egypt ($198 million), Sri Lanka ($167 million), China ($100 million) and others.

Thirty three per cent of the World Bank commitments during 1980-81 were made to countries with annual per capita gross national product (GNP) of $680 or less (at 1979 prices). On the other hand, all the IDA commitments during the year were made to countries falling within this group. Of the total IDA commitments 87 per cent were made to the poorest of the developing countries—those with per capita GNP of $370 or less.

Purposewise break-up

Out of the total assistance approved by the World Bank group during 1980-81, the largest share (30.6 per cent) went to projects in agriculture and rural development followed by energy 16.2 per cent, development finance companies 9 per cent, transportation 8.6 per cent, non-project and structural adjustment purposes 8.2 per cent and industry 7.2 per cent. The remaining 20.2 per cent of the approved assistance was for projects in the fields of education, water supply and sewerage, urbanisation, telecommunications, small scale enterprises, technical assistance and population, health and nutrition. (Table 2).

The share of agriculture and rural development projects in the total assistance approved during 1980-81 increased marginally from 30.1 per cent in 1979-80 to 30.6 per cent in 1980-81. The assistance approved for non-project and structural adjustment purposes also increased from 4.6 per cent in the previous year to 8.2 per cent in 1980-81 and that of industry increased from 3.7 per cent to 7.2 per cent over the same period. Other sectors whose share in the total assistance in 1980-81 was higher as compared with that in the last year were education, development finance companies, urbanisation, telecommunications, technical assistance and oil, gas and coal. In contrast, the share of power projects in the total assistance declined substantially from 20.8 per cent in 1979-80 to 10.8 per cent in 1980-81 and that of transportation from 12.6 per cent to 8.6 per cent. The percentage share of the total assistance approved for projects in water supply and sewerage, small scale enterprises and population, health and nutrition also declined over the same period.

World Bank finances

The net income of the World Bank increased to $610 million in 1980-81, an increase of 3.7 per cent over $588 million earned during 1979-80.

During the financial year 1980-81, the World Bank borrowed an amount of $5068.8 million mostly in the capital markets of Europe and Japan. This excludes $646 million that had been borrowed during 1979-80 and credited to the borrowing programme of 1980-81. These borrowings include the World Bank's first public borrowing in sterling since 1971, and the first public borrowing in guilders since 1976. For the sixth year in succession the public issues and private placements continued to be the most important source of raising funds. These together accounted for $3,762.6 or 74.2 per cent of the total borrowings in the year.

As on June 30, 1981, the subscribed capital of the World Bank stood at 36,614.5 million (SDRs 31,822.1 million). The authorised capital expressed in terms of special drawing rights (SDRs) was 70,500 million. The value of the authorised capital in dollar terms (calculated on the basis of the rate computed by the IMF on June 30, 1981–1 SDR = $1.15060) was $81,117 million. On January 4, 1980, the Board of Governors of the Bank agreed to raise the authorised capital stock of the Bank by approximately $40,000 million.

Developing countries

In 1980 the real growth in the gross national product (GNP) of the oil importing and oil exporting developing countries was much higher at 4.6 per cent than the rate of 1.3 per cent achieved by the industrial economies during the same year. However, developing countries as a group grew less rapidly in 1980 as compared with the average growth rate of 5.3 per cent per annum achieved by them during the decade 1971-80.

The current account deficit of oil importing developing econom increased from $8,300 million in 19 to $39,600 million in 1975. Develo ing nations were thereby forced to sort to adjustment measures and 1978 brought down their current count deficit to $27,100 million. Ho ever, these rose again to an estimat $43,100 million in 1979 and further an estimated $70,000 million in 1980.

Net disbursement of Official Dev lopment Assistance (ODA) from mer ber countries of the Developme Assistance Committee (DAC) of t Organisation for Economic Cooperati and Development (OECD) to t developing countries increased to estimated $26,600 million in 1980. Th represents a nominal increase of 19 p cent from the 1979 level, reaching 0. per cent of their aggregate GNP. Th percentage of ODA to GNP in 1970 had remained fairly constant betwe 0.33 per cent and 0.36 per cent.

Net disbursements of ODA by th member countries of the Organisatio of Petroleum Exporting Countri (OPEC)—which had grown rapidly the early seventies and had reache $8,200 million in 1975—dropped bac to an estimated $4,300 million by 197 In 1979 these increased to an estimate $4,600 million and further by 52 pe cent to an estimated $7,000 million 1980.

According to the World Bank man developing economies had to fac difficulties during 1980-81 as a resu of recession in the industrial economie inflation, rising energy costs, high inte rest rates, low growth of world trad volatile exchange rates and declinin prices of primary products other tha petroleum. Though the main problem were similar to those faced during th 1970s there were some crucial differ ences. The current downturn cam after years of relatively slow growth mounting unemployment, and high in flation in the industrial economies Compared with the sharp recession o 1974-75 the recession of 1980-81 wa much milder, yet recovery is expecte to be slower. This is because of th difficulties in reducing inflation, no considered to be a major underlyin cause of weakness of many economies. There is thus not much cause for optimism in the global outlook in the nea future, according to the World Bank annual report for 1981.

COVER STORY

World Bank group assistance to India

By COMMERCE RESEARCH BUREAU

DURING the fiscal year ending June 30, 1981, lending commitments by the World Bank and credit approvals by its affiliate, the International Development Association (IDA), to India amounted to $1,711 million (Table 1), up $51 million (3.1 per cent) from $1,660 million in the year 1979-80. Though the IDA still accounted for the major part of the total World Bank group's assistance to India, its share declined from 92 per cent in the previous year to 74.9 per cent in 1980-81. IDA's share in the total World Bank group's assistance to India in 1978-79 was 80 per cent.

India's share in the World Bank group's total lending declined further during 1980-81 to 13.9 per cent as against 14.5 per cent in 1979-80 and 14.9 per cent in 1978-79. Now that the People's Republic of China has joined the World Bank group, India's prospects for aid from the group are likely to be adversely affected in the future. While the World Bank's absolute commitment to India increased by 244 per cent to $430 million in 1980-81 as against $125 million in 1979-80, the IDA's sanctions declined by $254 million (16.6 per cent) from 1,535 million in 1979-80 to $1,281 million in 1980-81.

However, in spite of a decline in its share of the total assistance, India still continued to be the single largest beneficiary among the recipients of aid from the World Bank group. Next came Mexico and Brazil which received $1,081 million (8.8 per cent) and $844 million (6.9 per cent) respectively.

During the year 1980-81 per capita assistance to India by the World Bank group remained steady at the previous year's level of $2.6. India also retained its last year's fourth position in terms of per capita assistance among the countries of South Asia (Table 2).

Total	430.0	1,281.0	1,711.0	100.0

Table 2: World Bank Group lending to South Asian countries 1980-81

	Total lending ($ million)	Per capita lending ($)
Sri Lanka	167.0	11.1
Nepal	62.2	4.4
Bangladesh	334.0	3.8
India	**1,711.0**	**2.6**
Pakistan	202.0	2.5
Burma	55.0	1.7

The World Bank loans and IDA credits to India helped to meet a part of the expenses of 13 projects during 1980-81, of which eight were for agriculture and rural development and one each in the fields of industry, oil, gas and coal, transportation, urbanisation and telecommunications. During the year, three sectors, namely, agriculture and rural development, oil, gas and coal, and industry together accounted for more than three-fourths of the total assistance received by India: 30.4 per cent for agriculture and rural development and 23.4 per cent for each of the sectors, industry, and oil, gas and coal (Table 3).

Up to June 30, 1981, the cumulative assistance approved to India by the World Bank group aggregated to $12,766.8 million or 13.8 per cent of the total approvals by the group. (Table 1). While India's percentage share in IDA's cumulative assistance up to June 30, 1981 declined marginally to 39.8 per cent from 40.3 per cent at the end of June 30, 1980, its share in the World Bank's cumulative assistance remained steady at 4.7 per cent the level attained at the end of June 30, 1980.

At the Aid-India Consortium meeting held in Paris on June 9-10, 1981, the consortium pledged $3,450 million assistance to India for the year 1981-82 which is marginally higher than $3,410 million pledged for the previous year. In view of the frequent fluctuations in the value of the US dollar the consortium announced the aid quantum in terms of International Monetary Fund's Special Drawing Rights (SDRs). Thus quantified, the aid amounts to SDRs 2,820 million as against SDRs 2,730 million last year.

From the total assistance of $3,450 million pledged to India, about $2,000 million would be extended by the World Bank group. This amounts to 58 per cent of the consortium's total assistance during 1981-82 compared with 49 per cent in 1980-81.

Projectwise details of the World Bank group's assistance to India during 1980-81 are given below:

Agriculture and rural development: (a) $140 million IDA credit for the irrigation of some 1,07,000 hectares of land and for improvements in planning, design and construction, and operation of medium irrigation projects in Madhya Pradesh. During the next five years this would help increase foodgrains production in the State by more than 2,00,000 tonnes. Total project cost: $232.1 million.

(b) $125 million IDA credit to be disbursed through the National Co-operative Development Corporation for relending through state co-operative banks for co-operative warehouses and cold storage and marketing facilities in nine states. This would benefit more than 3.2 million families. Total project cost: $267 million.

(c) $83 million IDA credit for the construction of two barrages in Orissa across the Mahanadi and Birupa rivers to ensure the continued irrigation of 1,67,000 hectares of land. The income of farmers and the employment of agricultural labourers would thus be safeguarded. In addition, a drainage master plan designed to improve water management practices throughout the Mahanadi delta area is included. Total project cost: $110.3 million.

(d) $54 million IDA credit to finance the construction of 120 to 160 tank irrigation schemes on 25,000 hectares of land in Karnataka is expected to benefit about 8,000 farm families.

1978	VII Telecommunication project	(IBRD)	120.00
1981	VIII Telecommunication project	(IDA)	314.00
	Total (B)		802.00
	of which	IBRD	227.50
		IDA	574.50

In addition the government would be assisted in creating an improved hydrological data base, and a study of the ways to make more efficient use of irrigation water would be conducted. Total project cost: $77.4 million.

(e) $37 million IDA credit for the purpose of reorganising and strengthening the agricultural extension services in thirty districts of Madhya Pradesh. This would increase crop production and incomes of some 3.8 million farm families. Total project cost: $60 million.

(f) $30 million World Bank loan would finance reforestation and soil-conservation measures and the development of agricultural land in five watershed areas. This would help increase the incomes of about 23,000 farm families and owners of livestock who live in the foothills of the Himalayas. Technical assistance is also included. Total project cost: $60.8 million.

(g) $28 million IDA credit for the introduction of the training-and-visit system of agricultural extension throughout the fifteen agricultural districts of Tamil Nadu. This would increase crop production and benefit 3.8 million farm families. Total project cost: $45.6 million.

(h) $23 million IDA credit aims at providing for better agricultural extension services in Maharashtra through the introduction of training-and-visit system. This would benefit 5.8 million farm families from increased crop production and higher incomes. Total project cost: $38.2 million.

Energy

$400 million World Bank loan aimed at continuing the development of the southern and central areas of the Bombay High offshore oil field by drilling sixty-four wells and constructing fifteen production platforms, a processing platform, and a platform for living quarters. The production potential is expected to reach 12 million tonnes of crude oil a year by mid-1982. Co-financing to the extent of $30 million is expected to be provided by the OPEC Fund for International Development. Total project cost: $858.2 million.

Industry

$400 million IDA credit for the construction of a fertiliser plant in Gujarat that would produce 2,700 tonnes of ammonia and 4,400 tonnes of urea a day. This would result in foreign exchange savings from reduced imports of fertiliser to increase to more than $3,440 million during the next twelve years. Co-financing is expected to be provided by the ODA ($104.5 million) and OECF ($98.7 million). Total project cost : $1,276.9 million.

Telecommunications

$314 million IDA credit for providing additional direct-exchange lines, public call offices, telex facilities and related equipment and for upgrading and modernising the production facilities of three major manufacturers of telecommunications equipment. This would expand the country's telecommunications network in four metropolitan areas and extend it to about 40 million people living in small towns and villages who have never had access to public telephones. Total project cost : $1,619.4 million.

Transportation

$35 million IDA credit to finance the construction and rehabilitation of 700 kilometres of rural roads in Bihar and for improved road maintenance that would permit all-weather transport between farms and markets and facilitate rural development. Total project cost : $52.9 million.

Urbanisation

$42 million IDA credit for the second urban development project in Madras which includes the development of about 15,000 residential and 200 industrial plots on two sites, the provision of basic infrastructure and land tenure to 50,000 slum households, home improvement loans and grants to 80,000 slum households, the procurement of 550 buses, construction and maintenance of roads, and an improvement in management of solid wastes. Technical assistance and training are included. Total project cost: $84 million.

World Bank on South Asian economies

Indian economy bounces

THE World Bank, in a report on South Asian economies, says that the Indian economy rebounded in fiscal 1981 with growing strength in the latter part of the year. This followed a poor monsoon and generally disappointing performance in the previous year.

Aided by a good monsoon, agricultural production more than recovered from the depressed level of the preceding year. Though slower to recover, industrial output gained some momentum, so that growth in gross national product (GNP) was expected to be between 7 per cent and 8 per cent. Production of foodgrains in fiscal 1981 approximated the fiscal 1979 record of 132 million tonnes. Some easing of supply constraints occurred in coal production and port clearance. Against these significant gains, several economic indicators lagged: power and rail transport remained in short supply; the annual rate of inflation remained high at 16 per cent; and the balance of payments presented a serious problem as the current-account deficit increased sharply. Imports rose more than 3 per cent, fuelled primarily by sharp increases in the volume and prices of imported petroleum and fertiliser. This situation was exacerbated by a fall in domestic production of crude oil owing to political agitation in Assam. Although export performance improved somewhat, growth was insufficient to counter the deterioration in the terms of trade.

Stepping back from these recent developments and making a long-term appraisal suggests that the Indian economy today is substantially stronger than it was a half decade earlier, and it should therefore be better able to weather the effects of the harsher external environment. The country's agricultural and industrial bases are considerably broader and more diversified than they were in the past; imports of foodgrains have been gradually eliminated, while substantial buffer stocks of grain have been established; rates of gross investment and national savings have climbed to impressive levels, reaching about 22 per cent of GNP; substantial foreign exchange reserves have been built up; and external debt is at very low levels.

A number of difficulties of a structural nature remain, however, that require sustained action if soundly base development is to be possible in th future. The more serious problem include a very low level of per capi income ($190) with an attendant hig incidence of poverty; a severely strai ed economic infrastructure; inadequa domestic production of commoditie such as edible oils, fertiliser, cemen and steel; inadequate growth of exports; and continuing population pressure. However, significant changes i economic policies are taking place i India in response to the changing resource position and in preparation fo another period of balance-of-payment difficulties. The ambitious sixth five year developmant plan (fiscal 1981-85 addresses itself to all these challenges

During fiscal 1981, Bank assistanc to India continued to emphasise agriculture. The Bank has been particularly active in supporting minor irrigation and other on-farm investment through agricultural credit operation and in providing direct support to major and minor irrigation schemes. Marketing, seed development, agricultural extension, and dairying are other agricultural activities supported by the Bank The Bank has also been active in helping to finance the expansion of output in the fertilizer sector and, through its sizable assistance to development finance institutions, in a wide range of geographically scattered medium-scale and small industrial enterprises. IDA assistance in financing industrial raw materials and components for selected sectors of high priority has been instrumental in facilitating better use of capacity in industry. The Bank has also contributed to the alleviation of infrastructural bottlenecks through its support of the power sector, telecommunications, and railways. The further development of India's reserves of oil and natural gas has also received Bank support.

Bangladesh

Following unfavourable weather and poor harvests in 1979 and 1980, agricultural production in Bangladesh, under the stimulus of good weather, enjoyed a strong recovery in 1981, increasing by about 7 per cent, and the country's position in foodgrains improved considerably. As a result, gross domestic product (GDP) also expanded about 7 per cent. Apart from the effects of favourable weather, the growth in agricultural output was also attributable to government policies, reflected in increased investment in irrigation, better use of existing irrigation facilities, improved delivery of inputs, and price-support measures. Progress was also made in raising administered prices to reflect costs and in containing current expenditures while maintaining a high level of government investment.

Along with these favourable developments, however, fiscal 1981 witnessed a serious deterioration in public finances and in the balance of payments, continuing a situation that had been aggravated in fiscal 1980. The budgetary difficulties were associated with large expenditures for food procurement and a reduced inflow of commodity aid. Notwithstanding the conclusion of an Extended Fund Facility agreement with the International Monetary Fund (IMF), the balance of payments deteriorated because of declining jute prices, higher petroleum prices, and a shortfall in commodity aid.

Viewed in long-term perspective, Bangladesh has made considerable progress in recent years in laying foundation for its development. Among noteworthy gains that have been made are the rehabilitation and expansion of the physical infrastructure, better use of capacity, improved performance in public investment—all laying the foundation for future agricultural and industrial growth—and greater development activity on the part of the private sector.

This evidence of sustained recent progress must be seen, however, against the backdrop of the massive development problems that the country faces *viz*, low food production, widespread illiteracy, increasing pressure of population on a small land area, and shortage of energy. Indeed, agricultural development, education, family planning, and energy have been identified in the new second five-year plan as the country's top development priorities.

Activities of the Bank are designed to help the government address these problems. In agriculture, IDA credits are helping the government to implement its ambitious, yet technically feasible, Medium-term Foodgrain Production Plan, the aim of which is food self-sufficiency by 1985. Toward this end, credits have been provided for minor irrigations, agricultural extension, agricultural credit, and the production and transport of fertiliser. With a group of other donors the Bank is continuing its support of the family-planning programme and has been discussing with the government ways of improving the management of the programme. In energy, the Bank is supporting both development of the country's natural gas resources and the formulation of a national energy policy. To help broaden the industrial base and increase non-traditional exports, members of the Bank staff have been aiding the government in developing the basis for a comprehensive set of industrial policies along with direct lending for industrial projects.

Pakistan

In fiscal 1981, for the fourth consecutive year, the economy of Pakistan showed continued growth, although at a somewhat slower pace than in fiscal 1980. Indeed, an annual growth rate of about 5 per cent seemed within reach. Agricultural output increased by between 3 per cent and 4 per cent; in addition, industrial output also revived as capacity and its use grew and as the availability of imported inputs increased. The expansion was facilitated by good weather, continued growth in exports and migrants' remittances, and favourable economic policies that both encouraged the private sector and provided general economic stability. The government has enjoyed considerable success in its efforts at management of demand; the general budgetary situation, public and national savings, and inflationary pressure improved considerably in both 1980 and 1981. Balance-of-payments pressures, which have been severe in recent years, were moderated through the conclusion of an agreement with the IMF for an Extended Fund Facility, the largest granted by the Fund so far, and an eighteen-month rescheduling agreement on external debt with bilateral creditors of the Pakistan Consortium.

In industry, various incentives have begun to stimulate private investment and exports, while a concerted attempt to introduce reforms, including greater flexibility of management and tougher standards of financial performance, has reduced inefficiency in the public manufacturing sector. Agricultural production benefited from investments in quick-yielding projects, improvements in support services, and higher crop prices. Some progress has also been made in developing the country's energy capacity through new exploration, investments in generation and transmission facilities, and encouragement of the use of domestic fuels by the means of appropriate price adjustments.

These recent achievements represent only the beginning of an attack on the country's principal development problems. These include low productivity in agriculture, an inefficient public industrial sector, slow growth in large-scale private industry, heavy dependence on imported energy supplies, a low level of domestic savings, and a high rate of population growth. The Bank has worked closely with the government in attacking several of these problems. In agriculture, studies by the government and the Bank of water management in the Indus basin and other aspects of agricultural productivity have been responsible for significant policy reforms, including efforts to rationalise agricultural input and output prices and a redirection of agricultural investment. Bank-supported projects include seed improvement, the introduction of the training-and-visit extension system, and agricultural research. A programme of joint Bank-Pakistan investigations of the industrial sector is expected to improve efficiency in both private and public in industry.

Nepal

The economy of Nepal in recent years has exhibited little growth, largely reflecting the inability of the agricultural sector to expand output. GDP and agricultural growth since fiscal 1976 have averaged less than population growth, and per capita production of foodgrains has fallen steadily. While investment has expanded, growth in productivity has lagged. Largely as a result of the slow growth in agriculture, the current-account deficit in the balance of payments has increased sharply in recent years.

The obstacles to development in Nepal are severe; they include its difficult topography, inadequate infrastructure, institutional weakness, rapid population growth, and progressive deterioration in the physical environment as a result of steady deforestation and erosion.

The Bank has assisted in developing infrastructure in Nepal through credits for highways, power, and telecommunications. Now the assistance of the Bank is being directed toward the lagging agricultural sector through a number of projects in irrigation, rural development and farming in the hills, grain storage, and credits for forestry and erosion control. The Bank routinely incorporates technical assistance in virtually all its projects in the country in order to strengthen project implementation and institutional capacity.

Resurgence in Sri Lanka

The principal policy reforms of 1977 in Sri Lanka were followed by dramatic improvements in economic performance as import liberalisation, external assistance, and a rationalisation of prices led to an upsurge of private and public investment and large increases in production and employment.

Although growth in GDP decelerated in 1980 to about 5.5 per cent, this was still twice the rate that had prevailed during the period 1970-77. The slowdown was largely attributable to declines in tree crops, manufacturing, construction, and mining. Paddy production, however, grew more than 10 per cent during 1979, reaching a record high level and bringing the country close to self-sufficiency in rice.

A striking feature of Sri Lanka's recent growth has been a massive increase in capital formation. Important projects in the public sector include the Accelerated Mahaweli Programme and housing and urban-renewal programmes. Private investment has also increased sharply, with total gross investment increasing from 14 per cent of GDP in 1977 to 35 per cent in 1980. Foreign savings financed most of this large increase in investment.

Beginning in 1980 and continuing into 1981, claims on resources—especially demands by the public sector for the completion of important projects that require long gestation periods—brought severe pressures on public finances and the balance of payments, leading to rapidly rising prices and a reassessment, supported by the economic and sector work of the Bank, of the government's development programme. This reassessment has led to a decision to reduce general expenditures and readjust spending priorities.

The resurgence in the Sri Lankan economy and the accompanying pressures on resources had, by early 1981, reached the stage at which major stocktaking and policy actions were essential in order to preserve the gains reached in the period since 1977. The central problem was excessive spending on long-gestation or low-yielding projects, coupled with stagnation in exports of tree crops. A reversal of the deterioration in the overall economic situation requires a reform of public finances, including better performance of corporations in the public sector, reevaluation of the public investment programme, improvements in the tr
crop sector, and rectification of the tra
deficit by stimulating exports and co
taining imports.

The Bank is working closely w
the government in attacking these p
blems. The Bank is giving substant
support to the Mahaweli Programn
which consists of ambitious, multip
purpose projects for river-basin dev
lopment. Lending to expand produ
tivity in the tree-crop sector is an i
portant contribution to export develo
ment; joint studies of export-incenti
policies by the World Bank and t
Sri Lankan government have the sar
objectives.

'Sugar-coated' debentures

By KUMARAN POLA

DEBENTURES have always been bitter pills for the investors to swallow. They remain so even at present although the public relations officers in companies and the underwriters, brokers and managers to the public issues of debentures may want one to believe otherwise. Straight debentures with a simple fixed rate of interest and long term maturity or redemption are difficult to sell during an era of rising prices and interest rates. Therefore, marketing of debentures is possible only after appropriate 'sugar-coatings', *i.e.*, by offering incentives such as option for conversion into equity shares, upward revision of interest rate, additional interest to match with stepped-up dividend, buy-back of debentures, etc.

The debentures which are 'sugar-coated' well have received good response from the investors. On the other hand, in the case of debentures whose 'sugar-coatings' are thin, the investor-response has been lukewarm. The sudden spurt in the number and amount of debenture issues by companies is also the result of the exigencies caused by the reported resources constraints on the public financial institutions and the consequent compulsions on the companies to approach the capital market directly. This article attempts to examine the financial environment within the companies which have issued debentures during the last couple of months and also the external environment which has a bearing on the capital structure planning and financing patterns in these companies.

Loans from banks

During the seventies, the financial institutions emerged as the important supporter of the capital market. Their shares in the share capital and debenture capital issues, which devolved upon them either through direct subscriptions or through underwriting commitments, had been continuously rising. The financial institutions have become instrumental in removing the stigma attached to the raising of capital through debenture issues. Traditionally, the banks and other creditors had been looking askance at the companies issuing debentures. Issuance of debentures was considered generally as a sign of financial weakness.

By contributing as much as ten times in 1979-80 compared to what they did in 1970-71, the support from the financial institutions, by way of disbursements in respect of debentures, proved an important source of long-term funds to the corporate sector (see Table 1). However, the financial institutions have been constrained now to reduce the quantum of their support to the capital market. These institutions face resources constraint and the private sector companies are being told in no uncertain terms that their dependence on the financial institutions for long-term funds should be reduced. The companies are being instructed to approach the capital market directly to raise funds.

At the same time, the financial institutions have been directed by the Government not to underwrite debenture issues of companies coming under the purview of Monopolies and Restrictive Trade Practices Act (MRTP) and Foreign Exchange Regulations Act (FERA) except in cases where commitments for underwriting have already been made. Now they are allowed to underwrite such issues only when they are certain that the issues will be oversubscribed. At the same time, the Reserve Bank of India has begun making serious attempts at creating a secondary market for debentures to help the banks on whom debentures have devolved due to underwriting commitments. The RBI committee set up to recommend measures to develop a secondary market for debentures is now seized of this issue. This also has the effect of reducing the institutional support to long-term financing of companies.

These developments have been in the making for quite some time. The present institutional attempts to force companies to approach the capital market directly, combined with the earlier practice of in-

Dr Kumaran heads the corporate division in the Commerce Research Bureau.

corporating convertibility clause in long-term loan agreements with the financial institutions, explain more or less fully the recent spurt in the number and amount of debenture issues.

Financial environment

An analysis of the financial environment in companies which have issued debentures in the recent past indicates overwhelming consideration in favour of the issuance of debentures as a source of long-term funds. The companies included in the analysis are Associated Bearings Company Ltd, East India Hotels Ltd. Hindustan Development Corporation Ltd, Indian Rayon Corporation Ltd, J. K. Synthetics Ltd, Madura Coats Ltd, Reliance Textile Industries Ltd, Siemens India Ltd, Straw Products Ltd, Voltas Ltd and Wimco Ltd. The data used are based on the published annual reports of these companies. The financial year of all the companies ended in March or thereafter in 1980.

By issuing debentures to the public, companies can obtain long-term funds without yielding control. There is no dilution in ownership inasmuch as th proportionate shares of the existing shareholders in regard to the sharing of income and voting rights remain the same Long-term loans from financial institutions which are subject to convertibilit clause and additional equity capital issue will lead to dilution in control and return. Debentures assure a definite sourc of funds for pre-determined periods. Thi enables companies to evolve appropriat financial plans and stick to them. Th interest payable on debentures is fixe contractually and is lower than that expected on equity shares. It is also deductible expenditure from the point o view of corporate taxation. Because o this tax benefit, companies are able to trade on thin equity and magnify the earnings available to the shareholders by including more and more of borrowed funds in their capital structure (see Table 2).

Table 2 : Magnifyins effect of trading on thin equity

Name of companies	Totat borrowings networth (ratio) 1978-79	Totat borrowings networth (ratio) 1979-80	Long-term debt/ networth (ratio) 1978-79	Long-term debt/ networth (ratio) 1979-80	Return on total assets (precentage) 1978-79	Return on total assets (precentage) 1979-80	Return on net worth (percentage) 1978-79	Return on net worth (percentage) 1979-80
	1	2	3	4	5	6	7	8
Associated Bearings	0.26:1	0.35:1	0.07:1	0:04:1	9.74	12.21	16.73	21.44
East India Hotels	1.79:1	1.04:1	0.56:1	0.26:1	7.88	8.30	18.40	18.11

Indian Rayon	0.53:1	0.65:1	0.29:1	0.32:1	11.47	9.64	24.91	23.25
J K Synthetics	0.72:1	0.83:1	0.17:1	0.27:1	7.50	6.63	18.82	17.19
Madura Coats	1.35:1	1.33:1	0.26:1	0.30:1	3.26	7.34	9.97	22.74
Reliance Textiles	2.61:1	2.96:1	0.86:1	0.98:1	7.47	7.33	34.80	35.33
Siemens	0.47:1	0.67:1	0.13:1	0.12:1	4.72	4.76	14.98	17.88
Straw Products	0.99:1	1.05:1	0.51:1	0.58:1	5.46	6.37	12.71	15.47
Voltas	2.63:1	2.39:1	0.44:1	0.44:1	2.08	3.10	15.55	23.18
Wimco	0.81:1	1.06:1	0.23:1	0.31:1	4.96	5.65	11.73	14.94

All the companies included in the analysis show unutilised debt absorption capacities. The guidelines for the issue of debentures by public limited companies have fixed a ceiling of 2:1 for the debt-equity ratio. Even Reliance Textiles, Straw Products and East India Hotels, the companies with highest debt-equity ratios, have them far below the norm of 2:1 (see Table 2).

Low operating and financial leverages

Since these companies are operating with considerably lower operating and financial leverages, they do not run any risk of bankruptcy if debentures are issued to augment funds. Since these companies, whose reliance on banks and financial institutions is already moderate to heavy (see Table 3), are obliged to reduce this dependence, the two sources of funds available *viz*, issuance of debentures and the inviting of fixed deposits from public, will have to be tapped increasingly to augment their resources for permanent working capital and for expansion and diversification. The alternative is to miss the business opportunities which would mean a lot in terms of long-term profitability and survival for these companies. The low operating and financial leverages (see Table 4) indicate that already most of these companies are losing profitable investment opportunities because of the orthodoxy, conservatism and lack of ingenuity and boldness in corporate planning.

The operating leverage indicates the percentage change in operating profit (profit before interest and taxes) resulting from a certain percentage change in sales revenue. A low operating leverage gives the managements of companies enough cushion against the risks of fluctuations in sales revenues. However, the operating leverage ratios in the companies under analysis are too low to be described as prudent ratios. Except for Hindustan Development Corporation and Wimco, the operating leverage is below 2. The implication is that for a 10 per cent change in sales revenue, their operating profits will fluctuate only at a percentage lower than 20.

A low operating leverage provides a significant challenge and opportunity to company managements inasmuch as they have the freedom to raise the financial leverage which measures the effect on profit before tax due to increased use of fixed interest funds in the capital structure. There is no justification for keeping both these leverages low as it is tantamount to frustrating their own declared objective of maximising the rate of return on the shareholders' funds. Indirectly, this will get reflected in the low market quotations for the shares of the companies. Thus the share prices component of the shareholders' wealth in companies will also continue to be low.

It is noteworthy that the managements of Reliance Textiles, Voltas and Wimco are able to utilise their low operating leverages to the advantage of the shareholders. They have been using increasing levels of borrowed funds thereby raising their financial leverages. The net result is a favourable combined leverage. The combined effect of the two leverages is reflected in a certain percentage change in profits before tax for a certain percentage change in sales. These companies could experience a 31 to 40 per cent change in profit before tax for a 10 per cent change in sales revenue (see Table 4).

Source of funds

From the analysis given above, it is apparent that the external environment forces and the internal environment favour the companies to tap more and more of funds directly from the capital market either through debenture issues or as fixed deposits. Debentures have advantages over fixed deposit in certain respects. The rate of interest required will be higher than that on debentures. The ceilings on rate of interest at present are 15 per cent on fixed deposits and 13.5 per cent (plus additional one per cent in the event of the enhancement of dividend) on debentures. Further, only 85 per cent of the interest expense on account of fixed deposits are deductible for tax purposes in contrast to 100 per cent of the interest expense on account of debentures. During the period of rising prices and interest rates, there is no substitute to borrowings through debentures at fixed rate of interest with a 7 to 12 year maturity. The main hazard, however, is the uncertainty about the likely public response.

Table 4 : Operating and financial leverages

$$\text{Operating Leverage} = \frac{\text{Contribution (i.e. Sales—variable expenses)}}{\text{Profit before interest and tax}}$$

$$\text{Financial Leverage} = \frac{\text{Profit before interest and tax}}{\text{Profit before tax}}$$

$$\text{Combined Leverage} = \text{Operating leverage} \times \text{Financial leverage}$$

The straight debentures with a simple rate of interest and long-term maturity will not be welcomed by the investors. The successive hikes in the rates of interest on debentures, in fact twice during the last one year, *i.e.*, October 1980 and February 1981, have resulted in substantial depreciation in the prices of the debentures. The depreciation has ranged from 20 to 25 per cent in respect of several rights debentures issued with a rate of interest of 11 per cent following the guidelines formulated for the purpose by the Government in 1978. When the same companies are offering up to 15 per cent on fixed deposits with a maturity of only three years, the investors will not find it worthwhile anymore to invest in the straight debentures.

'Sugar-coating' of debentures

It is to arouse sufficient public interest and to ensure good response to the debenture issues that various incentives are being offered to their subscribers. These include additional one per cent interest when dividends exceed the predetermined rates, adjustments in interest rates on the issue of bonus shares, conversion of a portion of the debentures into equity, adjustments in the conversion ratios for bonus issues of shares before conversion, repurchases of debentures from the market, buy-back of debentures from the holders and upward revision of interest rates as per the government policy. As a result of the attractive package of additional incentives attached to the debentures, they have ceased to be the traditional fixed-income-yielding type of corporate securities.

'Sugar-coatings' have removed most of the unwelcome features of the straight debentures. For instance, the risk of depreciation in debenture prices may be minimised by their repurchase from the market or buy-back from the holders at the par value by the issuing companies. The undertaking to revise the interest rate upwards in tune with the government policy in this regard will also prevent such depreciation. Repurchase and buy-back clauses, in addition, confer liquidity on these securities. Similarly, the disincentive of holding on to the debentures with long-term redemption or maturity will be more than offset by the potential gain to the debenture-holders who receive equity shares at conversion prices which are considerably lower than the prevailing market prices.

Unbridled price rise

By ARVIND BHANDARI

THE opposition criticism in Parliament that continually rising prices are breaking the back of the common people does not seem to have stirred the conscience of the Government, such as it is. The Finance Minister has continued to make selective use of statistical data to present a garbled picture and draw comforting conclusions. Even the large crowd of women who demonstrated in Delhi some days ago did not move him. If only ministers themselves were to visit grocery shops to purchase the necessaries of life, instead of relying solely on official reports, the complacency in high quarters would lessen. On paper the wholesale prices have risen only by 6 per cent in the February to July period this year, but the consumer price index has jumped by 36 points (over 12 per cent) in the same period. Since then the consumer index has risen further because wholesale prices registered a 10-point increase in less than eight weeks. The trend of rising prices is confirmed by the substantial increase in the all-India consumer price index for industrial workers—from 382 points in May, 1980 to 439 points in June, 1981—marking a rise of 57 points against the average of 35 to 40 points in earlier years. This makes nonsense of the claim that the prices have generally been in check since the Congress (I) assumed power. Far from being under control, or confirming the much-talked-of "moderation", prices have shown a spurt which is the biggest in the past seven years. This indicates the failure of the Government's strategy of stabilising prices through imports of certain essential commodities even at a high cost to the exchequer. True, there is generally a time lag of about four months for a fall in wholesale prices to make an impact on retail markets. But owing to the administration's inability to ensure a steady flow in commercial channels, and the trader's unchecked tactics to release supplies in a trickle to prevent any fall in prices, the common man continues to pay dearly for his needs. Apart from other consumer goods, most vegetables are dearer this year. And yet the Government recently permitted large exports of vegetables to West Asia. Secondly, the Essential Commodities Act and the anti-hoarding measures have not been enforced with the necessary vigour and consistency. Since the wholesale index does not reflect the real price situation, official spokesmen would do well to rely on retail prices to assess the inflationary situation.

Hydel potential

Of Himachal Pradesh's immense hydel power potential, estimated at 12,345 mw, only 3,307 mw capacity has so far been exploited, even though the northern region's energy requirements have increased manifold during the past few years. Every additional step designed to utilise the State's river basins for power generation is, therefore, to be welcomed. The Rs 533-crore Nathpa-Jhakri project, which is primarily a joint Himachal-Haryana venture, has a chequered history. It was only last April that the respective shares of the various states of the region, including Haryana, Rajasthan, and the Delhi Union Territory, were fixed. The Himachal-Rajasthan accord on the Rs 345-crore Kol project, expected to generate 600 mw of power, is the latest in the series and, like the others, it is the result of prolonged negotiations in which Punjab was also directly involved. In May this year the Chief Ministers of Himachal Pradesh and Punjab agreed that the Kol Dam project in Mandi district would be executed jointly by the two states, subject to its clearance by the Central Government. According to an agreement signed recently, Rajasthan's share in the generated power will not be less than 50 per cent. Rajasthan has a 220 mw nuclear plant, but the State's growing need for energy is not being met. The promise of 10 per cent of Nathpa-Jhakri power and of at least 50 per cent of Kol project power would help cover most of the state's power gap. A far more ambitious and highly economical project, which has been under discussion for many years and promises to yield cheap power for the entire region, is the Parvati hydel scheme in Kulu district. This project, one of the biggest in the country, is estimated to generate 1900 mw of power at a cost of Rs 1,000 crores. Unfortunately, the progress made in pur ance of the decision to prepare a mas plan for the entire Parvati Valley is slo Meanwhile the water of this and seve other Himachai rivers is largely go waste even as the cost estimates power projects rapidly mount owing inflation. On current performan neither of these schemes will be co pleted before 1988. Massive funds a required for implementing these schem and it is to be hoped that the Cent with the assistance of internation agencies wherever possible, will not any of these projects suffer for lack finance or through administrative dela The history of the long delayed The Dam provides a timely lesson in th regard. Garrulous conferences abo energy conservation and development new sources of energy can only a quire meaning if simultaneously bu ness-like efforts are made to tap t country's known potential for chea hydel power

DATELINE NEW DELHI

Economy!

It is good to know the that Punja Government has decided to launch a economy drive. But, like its peer, th Central Government, it will have show actual results in order to live dow a reputation for empty locquaciousnes Past experience has shown a wide ga between intention and achievemen Exactly two years ago the predecesso state ministry promised virtually th same measures, which included limitin STD telephone facilities and restrictin official trips to Delhi of minister secretaries and heads of departmen Insofar as the present Governmen has been constrained to repeat the sam set of orders, one would be led to th conclusion that the previous directive were not implemented. A year ago th present Government imposed ban on th creation of new posts. Considering th fact that the bureaucracy replenishes i self at national average rate of 6 per cen per annum, this order too had much t commend it. The fact that the State' non-plan expenditure overshot the budge by Rs 40 crores last year suggests tha this measure too met with failure. Accor ding to an official statement, the new eco nomy drive has not been extended t universities, public sector corporation and various boards because the Government is not competent to exercise control over these bodies. This is true, bu the Government would be well withi its rights to question fresh demands fo funds made year after year. The annua losses of the Punjab State Electricit Board, for instance, average Rs 60 crores. At the same time the number of people employed by this undertaking rose by a stupendous 69 per cent between 1973-74 and 1977-78.

Special Reports

Another cotton textile industry crisis

BOMBAY

THE cotton textile industry seems to have run into another crisis. According to Mr K. Rajagopal, chairman of the Indian Cotton Mills Federation, most of the mills are exposed to cash losses. The prices of cotton and viscose fibre were chasing each other and, according to the ICMF's chairman, there was a strong case to reverse the trend through downward adjustment in the prices of cotton and viscose fibre. Between October 1980 and August 1981 the prices of some of the prominent varieties of cotton like Wagad, Kalyan, J 34 and 1007 moved up by as much as 30 to 90 per cent. "The economic working of a large majority of the mills has thus been shattered and the clock put back on modernisation, textile exports, yarn supply to the decentralised sectors at stable prices"

Mr Rajagopal was unhappy with the working of the Cotton Corporation of India as also the Maharashtra State Cooperative Marketing Federation, which is the agency for monopoly procurement of cotton in Maharashtra. Both of them, he said, had failed to take an economic and balanced view of the need to market in an orderly manner the cotton stocks procured by them. On the other hand, because of their monopoly hold on stocks, the free flow of cotton in the market was artificially restrained leading to a bullish trend in prices. Instead of going to the rescue of the cotton consumers by unloading the stocks and thus stabilising prices at reasonable levels, these agencies succumbed to the temptation of exploiting the situation, thereby contributing to the price spiral. He demanded that the scheme for monopoly procurement of cotton by the state agencies be dropped. Simultaneously the board of the CCI should be broad-based and its functions revamped to meet the overall national objectives.

In the context of a depleted carry-over for 1980-81 season Mr Rajagopal wanted import of cotton to continue. He explained that the average monthly rate of consumption of mills would touch around 6.80 lakh bales if they were free from energy constraints and the cotton supply position was stable. The carry-over requirements would, therefore, be at least 20 lakh bales. As against this, the carry-over stocks were estimated at only 13.50 lakh bales and there was a clear gap of 6.50 lakh bales in supply. He was happy at the government importing medium staple cottons from Pakistan, but suggested that instead of the offer of the imported cotton being restricted to exporting units and the mills in the co-operative and NTC sectors, it was necessary to make available import quotas to all the mills freely. In view

THE INDIAN COTTON MILLS FEDERATION
BOMBAY
TWENTY-THIRD ANNUAL GENERAL MEETING

Mr K. Rajagopal, chairman of ICMF, addressing the annual general meeting. Others, from left, are Mr Rasesh N. Mafatlal, Mr Tejkumar Sethi, Mr Madanmohan Mangaldas, Mr G. K. Devarajulu, Mr Kantikumar R. Podar (vice-chairman), Mr Arvind Narottam Lalbhai (deputy chairman), and Mr C. V. Radhakrishnan (secretary-general).

of the restrictions on the operations of the scheme at present the response, he pointed out, had been inadequate.

One another significant point made by him was that the use of finer cottons must be promoted by the government initiating fiscal measures to encourage consumption of long and extra long staple cottons. Under the present excise structure the duty on fabrics having the same price range rose sharply from two to four per cent to 15 per cent as soon as the average count of cloth crossed 40s and this acted as a damper on the consumption of long and extra long staple cottons. He pointed out that from the national point of view the break through achieved in the production of long staple cottons had to be encouraged as it gave a better return to the farmers. These cottons were capable of giving more metres of cloth per kg than the coarse and medium varieties. Therefore, to improve the per capita availability of cloth, without extending the cotton acreage, this shift in cultivation would be a major tool in the hands of the policy-makers. He drew particular attention to a recommendation of the Indirect Taxation Enquiry Committee that "the tax on cotton fabrics should be based on the price before tax, with the least rate of tax to be applied to the cheaper varieties of cloth."

Mr Rajagopal, in his address to the annual meeting of the Indian Cotton Mills Federation, also dealt with the problems of exports, IDBI soft loans, credit needs of mills and the increasing role being assigned to the handlooms in meeting the country's cloth requirements. He said that no precise idea was available about the number of operative handlooms, their exact location, state of equipment, conditions of workers, production pattern, marketing disabilities and other deficiencies. He reiterated the need for an all-india census of handlooms to assess the production and development needs of this employment-oriented sector. Similarly the proposed Powerloom Board should monitor the growth and production potential of that sector with a view to canalising the required help and to fulfil the role assigned to it.

The industry, he said, had repeatedly pleaded to the Government for the creation of a modernisation reserve to insulate it from the cyclical changes in profitability. It was unfortunate that the Government had not yet accepted this suggestion. That apart, the virtual withdrawal of the soft loan scheme by th IDBI and the hike in interest charge for term loans had also given a setbac to the mills' modernisation programme Further the IDBI had not agreed to finance overrun in project costs and th mills were finding it beyond them t meet the gap between the sanctione loan for machinery purchases and th escalation in costs. The least that shoul be done, Mr Rajagopal suggested, t gear up the pace of modernisation wa to restore the original terms of the sof loan scheme, with concessional rates o interest as an important component an financing of overrun in project costs i a realistic manner.

In the context of a widening trad gap, he emphasised that the textile should be one of the leading items of th country's export to augment the foreig exchange resources. The buoyancy i export earnings by the textile sector ha been kept up in the financial year 1980-81 in spite of the severe handicaps. A compared to the export earnings o Rs 786 crores in 1979-80 the export o all items of textiles in 1980-81 yielde Rs 874 crores according to Mr Rajagopa who, presumably did not restrict himsel to exports of cloth and yarn by the mil

Textile imports: Liberalisation mooted

From MALCOLM SUBHAN

BRUSSELS

AN article on textiles appeared in Sweden recently under the headline "A new, realistic import policy is needed now." It was *not* a demand for the Multifibres Arrangement to be tightened up or made permanent; it did not even ask for the continuation of the "Nordic" clause in the MFA. (This is the clause under which countries like Sweden, with small internal markets and a high level of imports, can take steps to preserve a "minimum viable" level of domestic production).

The article in fact called for a liberalisation of imports from developing countries. It pointed out that the barriers to such imports had worked to the detriment of both Swedish consumers and the developing countries—and had totally failed to protect domestic manufacturers. Imports had continued to rise—but they originated principally in other West European countries and the US.

The article was written by the managing director of the Swedish Textile Wholesalers' Association, Tore G. Sergenius. It underlined the sharp differences in the views of the trade, on the one hand, and manufacturers, trade unions and the government on the other. Whereas the latter are clamouring for greater restrictions on imports from developing countries, the import and wholesale trade throughout Europe is for unfettered access to any supplier of higher quality and lower-priced merchandise than is locally manufactured.

The association is quite clear as to why the Swedish textile and clothing industry has shrunk to the point where it today accounts for only 1 per cent of the total labour force (as against 10 per cent in the EEC). Wages in Sweden are twice as high as in the UK and 60 per cent higher, than in the US. It is therefore "unrealistic" of the industry and trade unions to continue to demand further protection from imports.

In any case, Sweden's main overseas suppliers are the other industrialised countries, who account for 83 per cent of all imports. The developing countries—mainly Hongkong, India and Korea—together account for around 17 per cent. But the import barriers are aimed primarily at the latter, with the result that Swedish consumers must pay much more for their textiles and clothing.

The basic position of the Swedish wholesale and retail trade is unchanged since 1972: the MFA must be "strictly temporary," to be replaced by free trade in textiles and clothing. Protection of domestic producers should be "reasonable," confined to yarn and fabrics and take the form of economic support measures rather than import duties and quotas.

The trade believes that the entire Swedish export industry would benefit were the Government to support developing countries in their demands for the progressive liberalisation of international trade in textiles and clothing. The ill-will generated by the country's import restrictions are a handicap which all Swedish exporters must currently overcome.

The Swedish market is not a large one, relatively speaking. After all, the country has a total population of just over 8 million, although its per capita income is one of the highest at over $ 12,000. Total imports of textiles and clothing amounted to some 87,000 tonnes last year.

But a move by the Swedish—and other Scandinavian—governments to renounce the Nordic clause would strengthen the hands of the developing countries in the MFA negotiations. It would also make it easier for Denmark to join forces with Germany and the Netherlands in resisting the protectionist demands of the UK., France and Italy.

and the decentralised sectors but also included the garment exports in his calculations.

This was obvious. when he went on to comment that it was rather sad that in the year of MFA negotiations India's fulfilment of quotas of fabrics to the EEC and the USA had woefully lagged behind. His explanation was that the industry had to contend with strident increases in prices of raw materials and other input costs while, on the other hand, the protectionist postures of the importing countries had, if anything, become more rigid. Of the MFA negotiations that have already begun, Mr Rajagopal had to say this: "From the battle lines that are being drawn at Brussels and Geneva it looks more like a multi-fibre 'arraignment' than a multi-fibre arrangement that is sought to be negotiated. I can well imagine the struggle of the Third World countries to carry conviction in their cry for greater access to the markets of the advanced countries,"

Mr Rajagopal proposed that the Government should do away with what he called outlived concept of placing a ceiling on cotton yarn exports and to allow free outflow. At the same time he drew attention of the industry to the fact that over 50 per cent of the world trade in textiles was in the field of blended and synthetic items and India's share therein was insignificant. Proper support and encouragement to the hosiery sector could also lead to a considerable improvement in its performance.

External borrowing for private sector?

From P. C. MAHANTI

CALCUTTA

AS the Sixth Plan resources budget provides for a substantial external commercial borrowing (to the extent of Rs 12,000 crores or so), the private sector has been hoping that it too will be allowed to tap foreign sources to meet part of its financial requirements. All the leading chambers of commerce in the country have been urging the Government to permit them to borrow abroad, especially against projects which have a short gestation period, or those meant exclusively for export production, or those with a high import substitution value and where profitability is high.

There are basically two strong reasons why India should go in for increased international borrowing. First, the aid climate has become more and more unfavourable due to the world economic recession which has reduced the lending capacity of the richer countries. Secondly, international capital markets are flush with liquidity which makes it easier for developing countries to borrow according to needs. In fact, countries like Brazil, South Korea, Malaysia and Indonesia have already borrowed considerably from these markets.

Dr Manmohan Singh, Member Secretary of the Planning Commission has, at a meeting organised by the Bengal Chamber of Commerce and Industry, strongly stressed the need for external commercial borrowing on a substantial scale. "It is absolutely necessary that at least part of the pressure on financial institutions should be taken away by industry looking for funds outside India. These would be syndicated loans from the Eurocurrency market," he has said. India has already successfully floated large loans for the National Aluminium Company, for the Oil and Natural Gas Commission and for Air India to a smaller extent. The same scope should exist for the private sector which too has big and viable development schemes in hand.

The Bengal Chamber itself has produced an excellent study entitled "India and the Eurodollar market," showing how the market has phenomenally grown, particularly since 1974 following the first major price hike by the Organisation of Petroleum Exporting Countries. Of the surplus generated by the oil price hikes which Mr Paul A. Volcker, chairman of the US Federal Reserve Board, has estimated at $ 240 billion ($ 1,000 million = $ 1 billion) cumulating between 1974 and 1979 and of which as much $ 95 billion has gone into the international banks comprising the Eurocurrency system. With this $ 95 billion, the size of the Eurocurrency market has grown from a mere $ 160,000 million in 1975 to $ 485,000 million in 1979. At the end of the past year, the size went up to over $ 600,000 million.

So there is no dearth of funds from this source for all deserving borrowers.

Money

Bulky and defective general ledger

THE accounting system of a bank has three objectives. Its main purpose is to record the day's transactions accurately and correctly at the branches. It is a commentary on the state of accounting in banks that even this simple primary function is not performed by the system today. The object of the system is to solve the accounting problems, but the antics of the system are such that it gets lost in the own problems of the system itself. The accounting problems thus remain pending or outstanding.

There is one major reason for delays and difficulties in achieving reliable, accurate and prompt accounts. The system is so complex and so vast, the number of transactions are so many and so complicated that no one person at the branch level has a total comprehensive picture of what is happening actually. The system therefore needs to be simplified, so as to make it comprehensible and understandable even to the juniormost accounts clerk at the branch.

This can be done if we have detailed checklists and guidelines at one place and if frequent changes on small matters of accounting or information significance are not made everyday but made only once a year. As the business of the bank becomes more and more complex several complicated adjustments have to be made. It is these that deter the staff at the branches and delay the process of accounting. The basic principle that should be followed in this respect is that the branches should be required to record the actual transactions only, as and when they take place as simple debits and credits and complex adjustments if any should be centralised in next higher administrative or control offices, where more talents and better supervision is possible.

The second objective of the accounting system is to facilitate reporting as a byproduct of accounting, without waste and duplication, to generate management information for making policies and taking decisions and to set up a communication and flow of such information that serves as strategic controls on performance.

Finally, the accounting system is totally incapable of analysing the income and cost structures or assessing profitability and productivity of the branches. The accounting system of banks is so much lost in the process of tallying and balancing the daily transactions and converting them into the form of accounts, that it has no scope or form to fulfil any of these secondary objectives of reporting or analysis.

The answer to these problems lies in reorganising the general ledger and its balancing and classification books. The general ledger has become too bulky, very unrealistic, totally unrelated to the realities. It contain 25 subheadings of deposit classifications, none of which serve any reporting or analytical purpose except once a year. All of them need to be transferred to a subsidiary general ledger. Further a large number of transit, provision or adjustment accounts, which again serve no reporting or analytical purpose also find a place also should be transferred to a subsidiary. On the other hand, advances to agriculture, small scale industries which are vitally important today, do not find a place in the general ledger at all. Every week and month when they are to be reported, information has to be compiled specially and classified from individual ledgers.

If this is done, the twin problems of inadequacies of the accounting reporting and analytical systems could be tackled simply. The general ledger is required for an overall total picture and for ensuring reliability of accounts. Its distribution in the subsidiary books is required for classification, analysis and statements and returns. In this way it is possible to make the accounting system simpler, more effective, sensitive and useful.

from the world capital markets, they should go in for it, especially for projects with high profitability and short gestation periods.

India has an excellent rating in the international capital markets. "Euromoney" has placed India in the No 9 position in a list of 67 borrowers. This is because India's economy is basically strong, has high debt servicing capability and oil has a major place in the composition of its imports. Thus India is qualified to borrow heavily, but she is an ambivalent borrower yet. It is time she became an eager borrower.

The opportunity cost view of Eurodollar borrowing emphasises that Eurodollars will supplement the existing resources and consequently will enable the country to take up new projects resulting in accelerated growth and development. Two specific arguments have also been advanced: First, India will soon face acute competition from other countries, notably China, for funds available from traditional sources including quasi-commercial ones like the International Financial Corporation. She has been receiving 40 per cent of funds from the above sources over the last few years.

Shortages and surpluses

Pig iron

Pig iron in short supply all over the country, adversely affecting many industrial units. Foundry units and units making spun pipes in Gujarat and Maharashtra on verge of closure for lack of pig iron.

Cement

Drainage work undertaken by the Lonavala Municipal Council in Maharashtra came to a halt due to non-availability of cement.

Acetic acid

Industries based on acetic acid faced with closure due to the acute shortage of this chemical.

Aluminium

Thirty thousand tonnes of aluminium piled up with the four major manufacturers.

Refrigerators

Nearly 65,000 refrigerators lying unsold with four large manufacturers.

As I see it

Indians working in West Asia

THERE are about one million Indians in the West Asian countries. Of them 1,18,000 have already become citizens of the countries in the region—99,500 in Yemen People's Democratic Republic, about 10,000 in Iraq and the rest in other countries. Another 80,000 Indians have settled in the countries of West Asia, although they still retain Indian citizenship—40,000 in Saudi Arabia, 17,000 in Oman, 15,000 in Bahrain and the rest elsewhere.

The Indians, who have gone to the West Asian countries with work permits during the past thirtyfour years, are estimated to number 5,66,000—2,50,000 in the United Arab Emirates (UAE), 80,000 each in Saudi Arabia and Kuwait, 68,000 in Oman, 30,000 in Qatar, 25,000 in Bahrain, 23,000 in Iraq, 5,000 in Yemen Arab Republic, 3,500 in Jordan and 1,000 in Yemen People's Democratic Republic.

Many Indians in these countries are subjected to various forms of harassment and exploitation according to a recent Estimates Committee report. According to the Government of India, in Saudi Arabia Indian workers are often confronted with the substitution of contracts with less favourable terms and conditions of employment, payment of salaries at lower rates than contracted, termination of services without payment of dues and return fare, deployment of workers on duties other than contracted for and poor working and living conditions. A number of Indian workers employed by a private company in Lebanon was subjected to beatings and inhuman treatment.

In Kuwait the passports of the Indian workers are retained by the employers who do not return the passports even when the employees leave their employment. The employers often deprive the employees of the document of the agreement between the employers and the employees on one pretext or the other. Persons are often compelled to do other jobs than contracted for. In Iraq the problems faced by the Indians are of a similar nature.

Women are subjected to worse treatment including molestation. Besides, Indian workers are arrested and put in prison on one charge or another. Instances are not rare when the Indian embassy in the country concerned was not informed of the arrests made—even when the Indian Government found the arrests were completely unjustified. The strange thing is that the recruiting company which was responsible for the unjustifiable arrest of a large number of Indian workers in Jordan has again been permitted by the Government of India to carry on its nefarious operations through recruiting Indian labourers. In Jordan money is extracted from Indian workers to provide them residence permits.

The worst aspect of the situation is that in several West Asian countries the Indian workers have been subjected to exploitation—not by the West Asian employers but by the Indian employers—with implicit connivance of the Government of India. The Secretary of the Government of India explained the Indian Government's inaction: "Unfortunately our hands are tied in this matter because we cannot really blacklist an employer just for this. Perhaps he is under taking a project abroad worth crores of rupees; and if we do not permit the implementation of the project it will be stopped..." There is no way to get away with the notion that only Indian private sector companies indulge in these types of malpractices. Reflecting the growing convergence between the private sector and the public sector managerial malpractices, the Indian public sector organisations also maltreat Indian labourers recruited by them to work abroad. Naturally this prompts Arab employers to feel justified in maltreating Indian workers. This, then, is the price the country pays for the socalled project exports."

MONSOON, CROP AND COMMODITY SURVEY: AUGUST 1981

Erratic monsoon dampens kharif prospects

By COMMERCE RESEARCH BUREAU

DURING August there was an uneven spread of the rainfall over the weeks. Even though the quantum of rainfall during the current monsoon till August-end was quite satisfactory, the long breaks in rains during the month over several areas were not reflected in the overall position. As a result of the erratic behaviour of the monsoon, the prospects of a good kharif crop were substantially reduced.

During the period June 1 to August 26, 1981 rainfall was good (excess or normal) in 33 meteorological sub-divisions accounting for 98.7 per cent of the population and 99 per cent of the net sown area in the country as compared with 31 sub-divisions accounting for 91 per cent of the population and 95 per cent of the net sown area last year. Rainfall was deficient in two sub-divisions covering 1.3 per cent of the population and one per cent of the net sown area as compared with four sub-divisions with nine per cent of the population and five per cent of the net sown area in the corresponding period last year. An analysis of distribution of rainfall during the month showed that the rainfall was scanty in only three sub-divisions during the week ended August 19 (accounting for three per cent of the population as also net sown area). However, the position deteriorated during the next week ended August 26 in that the rainfall was scanty in as many as 13 sub-divisions which accounted for 37 per cent of the population and 47 per cent of the net sown area.

Floods affected large areas in the country. Particularly affected were the states of Assam, Bihar, Gujarat, Madhya Pradesh, Rajasthan and Uttar Pradesh. The death toll in the floods so far (up to August-end) was 553. The number of villages affected was 22,230 while the cropped area affected was 16.28 lakh hectares. The population affected was about 19 million. The total loss in terms of damage to crops and public property was estimated at Rs 628 crores. The timely rains helped to improve the drought conditions in Haryana, Karnataka and Orissa. However, several areas in Madhya Pradesh, Maharashtra, Punjab, Rajasthan and Tamil Nadu suffered from drought resulting in lowering down the estimates of kharif production.

Besides an upward revision of its recommended price for ommon paddy from Rs 113 to Rs 115 per quintal reported arlier, the Agricultural Prices Commission (APC) revised upwards its earlier recommended procurement prices of kharif oarse grains *viz* jowar, bajra, maize and ragi from Rs 115 o Rs 116 per quintal. The price of groundnut-in-shell was iked from Rs 270 to Rs 273 per quintal, soyabean (black) rom Rs 210 to Rs 213 per quintal, soyabean (yellow) from Rs 230 to Rs 234 per quintal and sunflower seed from Rs 250 o Rs 253 per quintal. The procurement price for cotton was aised from Rs 375 to Rs 380 per quintal. The Commission id not suggest any change in the procurement prices of Rs 5.50 per quintal for sugarcane, Rs 8.50 per kg for light soil obacco and rupees eight per kg for black soil tobacco.

The rice procurement during the 1980-81 kharif marketing eason up to August 22, 1981 was 5.7 million tonnes as against .8 million tonnes during the corresponding period last year. Wheat procurement till the same date during the rabi marketng season 1981-82 (April to March) was 6.5 million tonnes as against 5.8 million tonnes during the corresponding period last year.

Commerce Research Bureau

Map not drawn according to scale

The cotton outlook for the 1981-82 cotton season (beginning on September 1) appeared to be bleak with the estimated production being less and the consumption by the mills being higher. According to the Cotton Advisory Board, the carry-over stock at the end of the 1981-82 season would be only 8.72 lakh bales, *i.e.* not even one and a half months requirements of the textile mills in the country. Of the one lakh bales of medium staple cotton to be imported from Pakistan only 49,500 bales were reported to have been contracted for import so far.

Ships carrying imported sugar started arriving at the Indian ports during the month. This helped to some extent in bringing down domestic sugar prices. However, no arrangements could be made for the distribution of imported sugar because of difference of opinion between the Government and the trade on the price at which the imported sugar would be sold.

The following paragraphs present the Statewise and cropwise position for the month of August 1981 :

ANDHRA PRADESH

The Godavari threatened several villages on its banks even as the flood waters entered Bhadrachalam town on August 11. People in East and West Godavari districts, especially in the low lying areas, were alerted. Two villages in Srikakulam district were affected by flood waters of the Vamsadhara river.

During the 1981-82 rice crop year (April 1981 — March 1982) the Food Corporation of India (FCI) procured 1.2 lakh tonnes of paddy till August-end 1981 as compared to thirty thousand tonnes during the corresponding period last year. Procurement of rice was higher by 1.5 lakh tonnes over that of last year. The FCI proposed to purchase an additional 50,000 tonnes before the end of the current crop year.

The Andhra Pradesh State Cooperative Rural Irrigation Corporation was set up with the object of making about eight lakh open irrigation wells in the State operational. Around rupees five crores would be spent on the first phase of the project to tap groundwater potential.

ASSAM

The flood situation in the State continue to be grave as a result of the fourth wave of floods. The Burhi Dihing, a tributary of the Brahmaputra inundated over 100 villages in Dibrugarh subdivision of upper Assam. Standing crops including sali paddy seedlings were damaged in the sub-division. Another tributary Gainadi submerged new areas in Lakhimpur district.

According to officials in the State Directorate of Agriculture, jute production in the State this season was expected to be more or less the same as last year, *viz*, 9.5 lakh bales.

Tea producers in Cachar district were reportedly facing a serious problem in despatching their tea because of difficulty in getting railway wagons. This had worsened their liquidity position.

The State Trading Corporation decided to set up an edible oil depot at Gauhati to facilitate quicker supply of edible oils to the north-eastern region.

BIHAR

The flood situation in the State was critical during the month as a result of the rise in the levels of all major rivers. Twenty out of 33 districts were affected by floods. While a population of 5.71 million in more than 6,000 villages was affected, standing crops in 5.45 lakh hectares were damaged. The total loss was estimated at Rs 100 crores. The State Government distributed 9.66 lakh quintals of foodgrains to flood victims.

Land owners in the State would be issued pass-books containing information regarding size of their holdings and other particulars. The pass-books would enable them to obtain loans from cooperative banks and other agencies without delay. The Bihar Tenancy Act would be amended suitably to incorporate provisions concerning distribution of pass-books.

GUJARAT

The Chief Minister, Mr Madhavsinh Solanki, stated that the recent heavy rains caused an estimated loss of Rs 50 crores. About 880 villages were affected 5,000 head of cattle lost and 737 houses collapsed. The floods claimed 105 lives. He urged the Centre to send its team to decide the quantum of financial aid to the State for flood relief. According to the Chief Minister the rainfall had proved beneficial for the kharif crops except in Mahesana district where crop damage was extensive.

The cotton crop in the State was estimated at 17.14 lakh bales during the 1980-81 season as against 16.86 lakh bales in the previous year. The Cotton Corporation of India (CCI) bought 2.13 lakh bales from the State during 1980-81. The State hoped to harvest 21.40 lakh bales of cotton in the 1981-82 season of which the CCI would purchase as much as 3.50 lakh bales.

The State Government decided to continue the experimental crop insurance scheme during 1981-82 in a new form with the cooperation of the General Insurance Corporation in 28 talukas in 12 districts. During the year groundnut, cotton (except hybrid varieties), paddy and bajra would be covered under the scheme.

The State Government pursuaded the vanaspati manufacturers to voluntarily reduce despatches to other States to 20 per cent of their total production with effect from August 18, 1981. The balance 80 per cent would be sold in the State.

The State urged the Centre to fix the profit margins for oilseed millers, wholesalers and retailers in all oil producing States so as to bring about parity in prices and margins.

HARYANA

Rains during the month saved the paddy crop in the State. The rain was particularly of great help in the dry belt of Faridabad, Gurgaon, Jind, Mahendragarh, Hisar and Rohtak districts raising hopes of bumper paddy crop. The grain storage capacity in the State increased by 0.15 lakh tonnes to 1.59 lakh tonnes during the past one year.

Paddy crop insurance was introduced in Kurukshetra district for the first time on an experimental basis. Under the scheme a farmer would have to insure paddy crop up to Rs 2,250 and pay Rs 100 as premium. Total insurance paddy crop in the district would be abo rupees four lakhs.

HIMACHAL PRADESH

According to a finding of -a si member study team appointed by t Union Ministry of Commerce, tea ga dens in several areas of the State wou be totally wiped out unless the Gover ment took drastic measures to retrie the situation. The team found that t growers were gradually shifting to oth cash crops due to the high cost of t production.

A 20-year perspective plan f afforestation was submitted by the Sta Government to the Planning Commissio The plan envisaged expansion of t forest cover from the present 20 per ce to 50 per cent.

JAMMU & KASHMIR

The floods in the Jammu regio claimed 25 lives and washed away hun reds of cattle.

The Jammu and Kashmir Agr Industries Corporation would procu fresh hops from the growers at the ra of Rs 11 a bag during this season. T production of fresh hops was estimat at 2,000 tonnes.

KARNATAKA

Flash floods were reported in Myso district of the State owing to the ove flowing of the Cauvery and Kabini river Army boats had to be deployed to pro vide relief to the marooned people i twelve villages. The floods in the Netra vathi river also affected the Dakshi Kannad district.

The dry spell in the southern part of the State ended with the good rainfal received during the month.

The State Government directed th various purchasing agencies to buy bid tobacco at the rate of Rs 12 per kg. A a result the tobacco growers of Nipan suspended their stir for remunerativ prices.

KERALA

The Kerala Assembly passed the Land Reforms (Amendment) Bill to free cultivating tenants from the liability to pay rent if resumption application fo cultivation of the lands was rejected by the land owners.

The Kerala State Cooperative Marketing Federation started procuring the entire cocoa produced in the State directly from the farmers. The Cocoa Marketing and Processing Society at Kottayam had been asked to procure wet cocoa beans from the farmers at the rate of rupees three per kg. The Government would give to the farmers a subsidy of a rupee per kg of wet beans sold to the society.

Figures of rainfall for Assam include also those for Meghalaya

The State Government decided to exempt tea plantations from the additional plantation tax which was levied in the 1981-82 budget. The Chief Minister met the Prime Minister on August 24, 1981 and sought her intervention to mitigate the plight of the peasantry in the State caused by the imports of coconut oil, cocoa and rubber.

MADHYA PRADESH

The State was lashed by two waves of floods during the month resulting in a loss of 14 lives. The Narmada and Tati rivers were in spate and inundated low-lying areas. Khargone town received 35 cms of rain in 30 hours on August 16, a record for the last three decades. The heavy downpour resulted in flooding of low-lying areas and house collapses.

The State Government ordered immediate measures to save the drought affected paddy crop in Raipur, Durg and Rajnandgaon districts. It sanctioned all available water from irrigation tanks in Raipur so that at least 1.75 lakh hectares of standing paddy crop in the district could be saved.

An integrated soyabean project costing Rs 27 crores would be set up in Madhya Pradesh and Uttar Pradesh which would be financed by the European Economic Community (EEC) to the extent of Rs 17.40 crores. Of this, Madhya Pradesh would receive Rs 13.50 crores for four processing units with an annual handling capacity of 2.4 lakh tonnes of soyabean and a refinery/vanaspati unit. The balance amount of Rs 9.60 crores would be provided by the National Cooperative Development Corporation, the two State Governments and the implementing cooperatives.

MAHARASHTRA

Kharif crops in different parts of the State were affected by both deficit and excess rains. While in the Marathawada region the kharif crop was affected by dry conditions, in the Vidarbha region the crops were affected by excess moisture. The Marathawada region also experienced acute scarcity of water and fodder.

The International Development Association (IDA) agreed to advance a loan of Rs 63 crores for Purna and Jayakwadi irrigation projects, including the command area development in the State.

The Chairman, Khar Lands Development Committee said that a Rs 21-crore programme for the development of khar (salty) lands in the Konkan region would be recommended soon to the State Government. Under the programme about three to four lakh hectares of land would be developed through the construction of a bund-cum-road to run parallel to every creek skirting khar lands. There were about 60 such creeks.

Procurement of new crop kapas under the State's Monopoly Cotton Procurement Scheme commenced on August 20, 1981 in the Phaltan-Baramati region. The farmers would be paid an ad hoc advance price for the kapas tendered under the Scheme till the cotton coordination committee recommended the guaranteed prices for different varieties. The State Government promulgated an Ordinance extending by one more year the duration of the Maharashtra Raw Cotton Act 1971 up to June 30, 1982, and making certain amendments to the Act which had expired on June 30, 1981. A bill to replace the Ordinance was introduced in the State Legislature subsequently. The purchases of kapas under the scheme during the last cotton season (1980-81) were 65.15 lakh quintals. The target of 17.47 lakh bales of cotton procurement was fixed by the State Government for the 1981-82 cotton season.

The Bombay Oilseeds and Oils Exchange decided on August 18, to introduce a voluntary price ceiling for groundnut oil. It fixed a ceiling of Rs 165.36 per 10 kg inclusive of salestax and Rs 16.75 per kg on retail basis. Subsequently the State Government decided to distribute groundnut oil through fair price shops at Rs 16 per kg, the quantum of oil being one kg for every family ration card.

The Maharashtra State Cooperative Marketing Federation purchased onions worth Rs 21.71 crores by July-end this year.

The State Government accepted the expert committee's recommendations to give 50 per cent capital subsidy to small and marginal farmers for mango plantations. The capital subsidy would be given to farmers for only two hectares of land. Under the scheme a loan of Rs 14,000 per hectare would be given for mango cultivation. Out of this amount, Rs 7,000 would be in the form of capital subsidy. An interest of 10.25 per cent per annum would be charged on the remaining amount. The State Government also agreed to the recommendation of the committee to give loans to farmers for all types of fruits for the first seven years. The loans would be recovered from the eighth year.

MANIPUR

The National Productivity Council prepared a credit plan for the State with outlays of Rs 21 crores for 1981 and Rs 23 crores for 1982 to accelerate the development of industrial, agricultural and service sectors.

The State fixed a kharif production target of 3.70 lakh tonnes of rice which it hoped to reach despite scanty rainfall in certain areas.

ORISSA

The drought spell in the State ende when a severe cyclonic storm lashed th coastal districts of the State on Augus 8. The Vamsadhara and Rushikuly rivers were in spate as a result of th storm. About five lakh persons in low lying areas in the river basins in Korapu and Ganjam districts were asked to evacuate. The storm claimed two lives an injured several others.

Earlier the drought had affecte minor millets, pulses and oilseeds crop in Bolangir, Kalahandi, Sambalpur, Ganjam and Koraput districts.

PUNJAB

The dry spell in the State cause concern for the kharif foodgrains production. Paddy transplantation was badl delayed due to the weak monsoon. Th State was also facing water scarcity together with power shortage. As a resul of the prolonged dry spell, kharif padd production was expected to fall much short of the target of 34 lakh tonnes.

RAJASTHAN

Though the State was lashed by heavy rains causing floods, famine loomed large as the monsoon was coming to a close. Rainfall was very much deficient in 13 of the 26 districts of the State.

The flood damage in the State was estimated at Rs 240.28 crores in the agriculture sector alone. The number of villages affected by flood was 1,576 having a population of 7.88 lakhs. Standing crops on 3.68 lakh hectares were destroyed while about 2.18 lakh hectares of cultivable land was rendered unfit for growing crops due to heavy silt deposit. As many as 31,200 head of cattle perished in the floods. Irrigation tanks numbering 416 were damaged and the Irrigation Department of the State had prepared an estimate of Rs 12 crores for their repairs. The Chief Minister estimated the cost of flood relief by the Centre at Rs 75 crores.

The Centre released rupees five crores as an interim-Plan grant to the State to meet the immediate need for relief works in the flood affected areas.

A sum of Rs 22.5 crores would be spent on the construction of the second phase of the Rajasthan canal during the current financial year.

As a result of the drought the kharif foodgrains output was expected to fall short of the target of 35.65 lakh tonnes by 30 per cent.

TAMIL NADUE

Fourteen out of sixteen districts of the State were reported to be gripped by acute drought. The State Civil Supplies Corporation had undertaken massive rice purchases from the States of Andhra

Pradesh, Madhya Pradesh, Punjab and Orissa. About 80,000 tonnes of rice was moved by road and two lakh tonnes by rail to the drought affected districts.

The State proposed to continue the procurement policy for *kuruvai* paddy — 40 per cent levy on paddy and milling trade. The cooperatives would also be asked to enter the open market for direct purchases at the open market prices.

A new short-duration, high-yielding rice variety IR 50 developed by the International Rice Research Institute and reported to be ideally suited to the State was introduced in the State. The short-statured rice variety was not season-bound and was highly resistant to pests and diseases. It would have a yield potential of 7,500 per hectare in 105 days.

The State Government had drawn up schemes to be implemented with a massive Rs 1,005 crores loan from the International Development Association (IDA) a subsidiary of the World Bank. The schemes, among others, were for provision of drinking water and improvement of irrigation tanks.

The State Agriculture Department launched a special programme to raise pulses production over one lakh hectares in Coimbatore district. The scheme envisaged supply of necessary seeds, fertilisers and plant protection chemicals at subsidised prices to the growers.

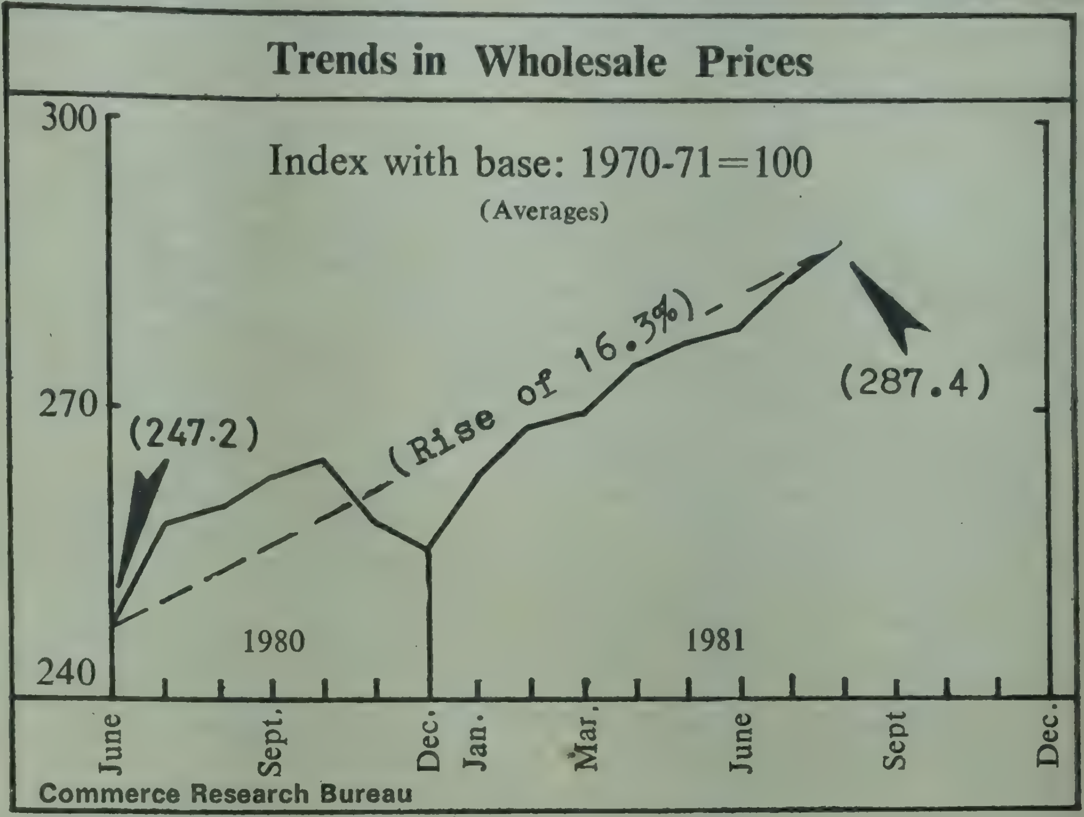
The State launched a five-year farm training and extension programme. The World Bank would provide 70 per cent of the estimated cost of Rs 36.47 crores. The balance would be shared between the Centre and State Government.

The State Government extended its old age pension scheme to cover destitute agricultural labourers aged sixty and above. As a result the number of recipients would increase from 1.5 lakhs to two lakhs.

UTTAR PRADESH

Fresh floods inundated new areas in the eastern districts with the swollen Ghagra and Rapti rivers ravaging vast areas. In all, 12,533 villages in 31 districts and an area of over 17 lakh hectares including cropped area of over six lakh hectares were affected. The death toll in the current floods mounted to 261. The total population affected was about nine million. The loss of property was estimated at Rs 237.40 crores. The State sought Central assistance to the tune of Rs 216.74 crores.

The State Government drew up a Rs 107-crore programme for undertaking social forestry, afforestation and other schemes in the State during the Sixth Plan period. The programme sought to initiate a series of measures which would increase the area under various kinds of



Commerce Research Bureau

PRICES IN AUGUST 1981

Persistent rise

THE wholesale price index continued its upward march. At 287.4 the wholesale price index showed an increase of 1.3 per cent over the preceding month. During the first five months (April-August) of the current financial year the average index was higher by 13 per cent over that in the corresponding period of 1980-81.

The rise during the month was mainly attributed to a rise in the prices of copra, raw cotton, raw jute, rubber, groundnut oil, coconut oil, rice bran oil and electricity.

Month	Wholesale price Index (Average) (1970-71=100)	Percentage change
1980		
July	257.8	+4.3
August	260.4	+1.0
September	262.9	+1.0
October	264.6	+0.6
November	258.4	—2.3
December	255.3	—1.2
1981		
January	262.6	+2.9
February	268.1	+2.1
March	269.5	+0.5
April	274.6	+1.9
May	276.8	+0.8
June	278.8	+0.7
July	283.7	+1.8
August	287.4	+1.3

forest plantations from 6.34 lakh hectares as on March 31, 1980 to 8.75 lakh hectares by 1984-85.

WEST BENGAL

Heavy rains in Midnapore district during the month submerged 36,000 hectares of cultivated land thereby destroying crops. The Contai sub-division suffered the most. However, kharif crop prospects in the State as a whole were bright with 80 per cent of the transplantation of *aman* paddy having been completed.

The State Government decided to encourage farmers to engage in higher production of wheat during the coming rabi season. The Government proposed to provide subsidy to farmers on the purchase of wheat seeds and to distribute a larger number of mini kits during the wheat sowing season.

The State urged the Centre to fix the procurement price for coarse paddy at Rs 125 per quintal and for the fine variety at Rs 130 per quintal. However it wanted that the issue price to the consumers should be maintained at the existing levels by introducing a subsidy element.

The Centre decided to allot 10,000 tonnes of urea to the State during 1981-82 from the Phulpur plant of the Indian Farmers Fertilizers Cooperative Limited. A Rs 35-crore social forestry project was being implemented by the State Government. The project largely financed by the World Bank to the tune of Rs 23 crores aimed at providing wood for fuel to the villagers and fodder for their cattle.

Rice

Rice exports during 1980-81 totalled seven lakh tonnes at an average price of Rs 3,000 a tonne as against the export of five lakh tonnes in 1979-80 at an average price of Rs 2,500 a tonne.

The Centre decided that procurement of paddy and rice under the support price policy would henceforth be only on Central account. Enough purchasing centres would be opened and the State Governments would be provided with adequate funds for purchases on behalf of the Centre.

During the 1980-81 kharif marketing season procurement of rice until August 22, 1981 totalled 56.63 lakh tonnes as against 37.78 lakh tonnes during the corresponding period last year.

In the T'guddem market the price of rice (fine) rose by 4.5 per cent during the month to Rs 310.81-317.57 per quintal.

Wheat

Procurement of wheat during the current rabi marketing season (April 1981-March 1982) until August 22, 1981 amounted to 64.96 lakh tonnes as against 58.35 lakh tonnes during the corresponding period last year. It was reported that 70 per cent of the wheat production in Punjab was affected by disease.

The Plant Institute of Agricultural Sciences, Banaras Hindu University developed a new variety of wheat known as "Malviya Wheat '55'". The new variety was reported to be superior to other wheat varieties in the north eastern-plains in respect of yield, disease resistance, grain quality and adaptability.

The average landed cost of imported US wheat was now estimated at Rs 196.40 per quintal inclusive of ocean freight and incidental expenses of unloading. The break up was: average FOB cost Rs 153.95, ocean freight Rs 36.04 and incidental expenses of unloading Rs 6.40 per quintal. The first shipment of US wheat was expected to arrive in India in September.

The price of wheat (deshi) in the Delhi market declared by eight per cent over the month to Rs 190-210 per quintal.

Jute

A cell for continuous monitoring of the raw jute sector would be set up to ensure remunerative prices to growers. This was recommended by the tchnical workshop on jute industry in Calcutta held during the month.

The ten-member working group on institutional credit to jute growers set up by the Reserve Bank of India under the Chairmanship of Mr P. R. Pradhan was expected to finalise its report by the end of September. The group met in Calcutta on August 26 after a series of discussions and field surveys since its formation.

The Reserve Bank of India extended till September the period of credit given by commercial banks to mills for additional raw jute purchases from the Jute Corporation of India (JCI). The mills would now be given credit to buy raw jute for four more weeks' consumption, over and above the 10 weeks' stock now allowed. The additional credit would not require prior authorisation from the Reserve Bank.

The JCI purchased one lakh bales of raw jute until August-end 1981 during the current jute season which started in July. The Corporation had procured a record quantity of 10.62 lakh bales during the 1980-81 season.

The crisis in the jute mill industry deepened with a sharp rise in stocks of finished products and a steep decline in exports during July—the first month of the 1981-82 season.

The Union Government planned an emergency rescue purchase of one lak bales of B. Twill bags to grant relief t the jute mills.

In the Calcutta market the price o jute (W-S) ruled steady during the mont at Rs 240 per quintal.

Cotton

The Cotton Advisory Board (CAB at its meeting on August 29 tentativel estimated indigenous production at 8 lakh bales for the 1981-82 cotto season as against 76.50 lakh bales i 1980-81. The latest balance sheet was drawn by it as follows:

(Lakhbales)

	1980-81	1981-82
I. **Supply**		
Production	76.50	80.00
Imports	—	1.00
Carryover stock	25.55	13.47
Total I	102.05	94.47
II. **Offtake**		
Mill consumption ..	78.50	80.00
Ex-factory consumption ..	3.00	3.00
Waste spinning units ..	0.45	1.00
Exports (including spill-over)	6.63	1.75
Total II	88.58	85.75
Closing stock (I-II) ..	13.47	8.72

Incidentally the carry-over stock of cotton estimated at 8.72 lakh bales at the end of the 1981-82 would be an all time low.

During the 1980-81 cotton season, the Cotton Corporation of India (CCI) procured 11.93 lakh bales as against the target of 15 lakh bales. The CCI operated through 205 purchase centres. The CCI has fixed a target of 16.12 lakh bales for the 1981-82 season commencing on September 1, 1981.

The Maharashtra State Cooperative Marketing Federation (MSCMF) commenced procurement of new crop kapas under the State's monopoly Cotton Procurement Scheme from Phaltan-Baramati zone. The State would pay an advance price to growers equivalent to the guaranteed prices announced in the official gazette of November 7, 1980 until the procurement prices would be decided by the Cotton Coordination Committee.

The MSCMF invited offers for the sale of 48,894 bales of Fair, X-grade, Kawadi, yellow pickings and other low grades of different varieties of 1980-81 season cotton.

As reported earlier India contracted for the import of one lakh bales of medium staple cotton from Pakistan. The imports would be canalised through the CCI. The Commerce Ministry notified that mills which took the imported cotton would have to either ensure export of textiles to the extent of one kg against 1.4 kg of raw cotton or supply yarn to handlooms. The allocation would be

subject to export obligation to be discharged by March 31, 1982. The Centre also decided to waive the import duty on this cotton.

The enquiries up to August-end were only for 50,000 bales of which the National Textile Corporation (NTC) accounted for 40,000 bales as against 10,000 bales by the private sector mills.

The Union Government authorised the export of 75,000 bales of long and extra-long staple cotton. The CCI and the Maharashtra State Cooperative Marketing Federation were allocated 25,000 bales each while 20,000 bales were allocated to the Gujarat State Cooperative Cotton Marketing Federation. The balance 5,000 bales was yet to be allocated.

The Agricultural Prices Commission revised upwards its earlier recommended support price of kapas from Rs 375 to Rs 380 per quintal for Fair Average Quality (FAQ) grade of 320 F Punjab American variety.

The price of cotton (Bengal deshi) in the Bombay market rose by 2.6 per cent during the month to Rs 1097 per quintal.

Edible oils

The Union Government raised the allocation of imported edible oils to the vanaspati industry by 30 per cent during the festival months to tide over the peak demand. In all 30,000 tonnes of imported edible oils were expected to be released in addition to the monthly allocation of 50,000 tonnes to the vanaspati industry during September and October.

The Lok Sabha approved the Customs Tariff (Amendment) Bill raising the basic customs duty on imported vegetable oils and allied products to 200 per cent from the earlier level of 40 per cent. The effective rate of duty was, however, fixed at 150 per cent by a notification.

The Planning Commission asked the States to intensify their programme for monitoring oilseeds production by initiating a three-tier system of review—first by the Chief Minister once in six months, next by the Agriculture Minister at district level periodically and finally regular monitoring by the Agricultural Production Commission and Director of Agriculture.

Edible oils imports during the period November 1980 to July 1981 amounted to 7.52 lakh tonnes. Nearly 1.54 lakh tonnes of imported edible oils were expected to be received duriny August.

The Centre assured the four southern states — Andhra Pradesh, Karnataka, Kerala, Tamil Nadu — and the Union Territory of Pondicherry an increase in the monthly allocation of imported edible oils for the period August-October 1981.

Keeping in view the festival season demand the Centre decided to supply an additional two lakh tonnes of imported edible oils for distribution through fair price shops.

The Agricultural Prices Commission revised upwards its earlier recommended price for groundnut-in-shall from Rs 270 to Rs 273 per quintal, soyabean (black) from Rs 210 to Rs 213 per quintal, soyabean (yellow) from Rs 230 to Rs 234 per quintal and sunpower seed from Rs 250 to Rs 253 per quintal.

In the Bombay market the price of groundnut (Karad bold) declined by 3.3 per cent during the month to Rs 616 per quintal.

Sugar

Sugar production in July, the tenth month of the current season (October 1980 to September 1981) was 19,000 tonnes as against 17,000 tonnes during the same month last year. The total production in the first ten months touched 50.67 lakh tonnes as against 38.22 lakh tonnes during the corresponding period last year. Despatches during July were 4.59 lakh tonnes for internal consumption and nil for export as against 3.58 lakn tonnes for internal consumption and nil for export in July 1980. The total offtake in the first ten months was 39.47 lakh tonnes for internal consumption and 60,000 tonnes for export as against 44.44 lakh tonnes for internal consumption and 2.30 lakh tonnes for export during the same period last year.

The total closing stock of sugar with the factories as on July 31, 1981 was about 16.55 lakh tonnes as against 12.34 lakh tonnes on the same date last year.

The Union Government reduced the tariff value of free sale sugar by Rs 40 to Rs 550 per quintal for September 1981.

According to official sources, during the new sugar season commencing on October 1, 1981 sugarcane crop was estimated to be 180 million tonnes while sugar production was estimated in the range of 65 to 67 lakh tonnes.

The Centre released 4.96 lakh tonnes of sugar for internal consumption for September—55,000 tonnes more than the quota for August. This included 2.71 lakh tonnes of levy sugar and 2.25 lakh tonnes of free sale sugar (including 25,000 tonnes of imported sugar). Three ships with about 30,000 tonnes of imported sugar had arrived in the country so far. The total imported sugar cost was estimated at Rs 100 crores.

In its revised recommendations, the Agricultural Prices Commission did not suggest any change in the procurement price of Rs 15.50 per quintal recommended by it earlier for sugarcane for the 1981-82 season.

In the Bombay market the price of sugar (C-30) declined by 12.8 per cent during the month to Rs 559-570 per quintal.

Rubber

During 1981-82, a quantum of 28,150 tonnes of natural rubber was proposed to be imported by the State Trading Corporation (STC). Imports would be inevitable as demand for natural rubber at 1.85 lakh tonnes was expected to be higher than the estimated production of 1.65 lakh tonnes. The country's stock of rubber at the end of July 1981 was estimated at about 30,000 tonnes which was only two months' requirement against the minimum three months' inventory stipulated by the Government.

The Union Government decided to exempt from customs duty an additional quantity of rubber imported by the STC. The duty exemption order was likely to cover about 25,000 tonnes of rubber.

Tea

The Union Minister for Commerce stated on August 25 that the Centre had no intention of nationalising the tea industry or even the trade in it. The tea industry was awaiting the announcement of a package of relief measures to lift the industry out of the morass. These measures were included in the recommendations of the two-day meeting of tea interests as well as representatives of Central and State Governments held at New Delhi on August 3 and 4. Some of the recommendations were:

(i) The excise duty on tea should be reduced, (ii) the West Bengal rural employment cess should be waived on all export sales of tea, (iii) excise duty on packet tea should be substantially reduced or totally removed, (iv) agricultural income tax, sales tax and other local taxes should be adequately cut and (v) indirect taxes paid on exports should be refunded through a simple draw back procedure.

During the period April-June 1981, actual shipment of tea from the country went up by 11.27 million kg to 46.74 million kg but the unit value fell by Rs 1.72 per kg.

The price of tea in the Bombay market ruled steady at Rs 2,300 per quintal during the month.

Coffee

The Union Government reimposed the export duty on coffee at the rate of Rs 75 per quintal with effect from August 21, 1981. This was done in view of the increase in the international prices of the commodity.

New directions in packaging

—A FEATURE

Packaging revolution: The tasks ahead

By P. K. DAS GUPTA

THE last decade had witnessed considerable changes in the distribution and marketing of industrial products. Today there are indications of change connected with the farm sector in those areas. Either, these changes have influenced corresponding changes in the packaging scene or the developments in packaging have contributed to such changes. No doubt, the packaging material manufacturing and conversion industry has been able to meet the challenges. Yet, considerable room exists for promoting the standards of packaging, using Indian materials and systems, in the face of severe cost escalations arising from the energy crisis being witnessed from the mid-seventies or for exploration of new areas of growth for expanding the packaging industries' sphere of activity.

The next decade is likely to see a number of new dimensions being added to the role of packaging in the country. With new materials being added and the compulsions of cost reduction becoming even greater, there are as many problems as there are newer opportunities for the packaging industries to grow.

Some of the more important tasks that face the packaging material supplier and the packer today relate to the adoption of a code of conduct for packaging of goods, the protection of consumer, resource conservation, packaging for exports, etc. The opportunities lie in the non-traditional areas where packaging industry has been observed to be hesitant to penetrate perishable areas such as vegetables, fruits, flowers and food production.

Code of conduct

Despite the spectacular expansion of the packaging industry the standards of packaging in the country continue to be poor. This situation is almost always blamed on the package conversion industry. A closer scrutiny of the situation would, however, reveal that the responsibility for this state of affairs rests equally with the package users in the organised sector of the industry. It should be realised that after all the package manufacturer can only meet the need as stated by the buyer — the packer — at a price. The responsibility for adoption of non-standard or improper quality, even when better materials are available, is an avoidable situation. The material control and marketing personnel connected with taking decisions on packaging in industry would do well to examine the causes for this malady. The organised industry can set the trend in innovation, standardisation, and variety reduction so that the rest of the community can follow in their footsteps. No doubt they need the cooperation of the primary material producers and package makers in this effort. But the packers must adopt a code for better packaging of goods, and implement it sincerely. Otherwise, the packaging industry will not have the necessary motivation to achieve greater excellence.

Consumer protection

The consumer in India today suffers due to a number of wrong notions in industry and trade about packaging. Goods that are required for his basic needs are not packaged on the wrong premise that packaging adds to cost. But ultimately it is he who pays for the losses and damages in transit due to the absence or inadequacy of packaging. Secondly, because he is forced to buy the bulk of his needs in loose, there is no guarantee that he receives the right quantities, despite his already being overcharged to compensate for the losses in transit for which he was not responsible. So, even for quantity he has no guarantee. Thirdly, because of the absence of brand or source identity in essential goods he has no guarantee of the quality of the goods as well. The entire thinking connected with protection of consumer has to undergo a radical change if the consumer were to benefit in real terms. No doubt the Packaged Commodities Order is a good beginning where the packaging

Mr P. K. Das Gupta

consciousness is already in existence. The scope of this order may have to be enlarged to make packaging mandatory, once it is established that consumer's interests will be safeguarded through such a measure.

Export packaging

While the packaging industry has certainly grown by leaps and bounds and is now in a fairly higher technological level, one does witness imports of packaging materials on a massive scale for export needs. The import policy for registered exporters lists instances where packaging materials and packages are permitted to be imported. Currently, the country is committed to exporting large quantities of consumer goods to the USSR, and it is common knowledge that packages for the products are being imported for the purpose. This situation is not quite desirable in the overall long-term interests of Indian exports. For, even as it is, due to the poor appreciation of the role played by packaging in the industry and trade, India's image in the rest of the world is at a low ebb. Imports of packaging mate-

---

Mr Das Gupta is chairman of Indian Institute of Packaging and Tea Trading Corporation of India Ltd.

rials would tend to further reinforce doubts about India's capability in the field.

On the one hand we have packages, designed and produced in India, that have won awards at international contests and at the same time we depend on imports even from countries which are much less industrially advanced than India. There is a need, therefore, for the exporters and the packaging industry to get together to discuss and sort out this thorny issue. Perhaps high costs resulting from high raw material cost or the systems of taxation are responsible. The remedy lies in identifying measures that will ensure that these causes are remedied so that Indian products can be exported in Indian packages. There is a need for export promotion councils in the country to enter into a dialogue with the packaging interests, may be, using the forum of the Packaging Institute where necessary.

Resource conservation

Studies undertaken recently by the Sivaraman Committee which went into the problem of eco-development of the Himalayan region has come out with certain startling revelations. In order to pack fruits in the Himalayan region for every one hectare of orchard about 10 hectares equivalent of timber is wiped out. This happens despite the availability of alternative materials. It is rarely realised that the kind of forest wealth that is being used for the purpose need not necessarily be used and that it deprives the paper industry of its raw material resource on the one hand and on the other the engineering industry which cannot but make use of timber based packages (because of the heavy loads involved) also suffers as it has to make do with less efficient materials leading to avoidable losses and damages in transit. The conservation of resources and the adoption of proper packaging *i.e.* eliminating of unwanted packaging from one side and putting the packaging material to the right use on the other, are areas in which every citizen of the country should be involved because his future resources are at stake. The packaging industry would, therefore, have to generate public opinion on the role of proper packaging in resource conservation and at the same time identify and promote proper usages.

While the above are areas which highlight the need for greater dialogue between the Government and trade as well as within the industries the opportunities in the context of the emerging technological society in the country, where packaging tends to be accepted as a part of life, are many and of significant importance.

Flowers : Today there is a new awareness of the potential for the export of flowers, particularly to the developed countries during the winter months. While there is enough room for undertaking work with regard to the types and species of flowers that are required to be marketed, there is a need for developmental work to be undertaken towards their packaging. Here the problem is not merely of packaging but also of simple techniques of preservation. The packaging technologies and the agricultural scientists would have to get together on this subject. Agricultural universities can undertake studies on the subject and the Institute of Packaging can help where packaging is involved. The vast potential that can be very easily tapped if one were to have a look at just the EEC market would bring home this aspect. The increasing gap between imports and exports, which is expected to widen further, can be plugged only when exports are promoted in the not too traditional areas such as flowers.

Vegetables : As in the case of fruits there is hardly any reliable statistics available with regard to vegetable production in the country. While every little information is available with regard to the movement into the markets in the urban areas in the country, the quantum of marketable production is not known. Here again the adoption of appropriate packaging techniques was given any serious consideration only when exports picked up in a big way with the opening of the Gulf markets in the latter half of the 1970s. Whatever packaging was adopted was product of the urban centres and no attempt was made to shift the productions scene to the rural India. An interesting opportunity given for rural industrialisation is still neglected. The product loss from the rural to the urban centres in age old packaging forms and norms is still being tolerated. Assuming that about 10 million tonnes of vegetables including potato, onion, tapioca, *etc* are moved to urban markets and 10 per cent in terms of weight will be the quantum of packaging consumption for the purpose, the trade as well as the packaging industry must get together to determine how best the profitability in this business can be improved further for the benefit of the farm sector and the consumer. The governmental measures necessary for the purpose must be identified and taken up with appropriate agencies.

Horticulture : The country's urban markets receive over two million tonnes of fruits every year. Even statistics concerning the marketable production are not available. Particularly those connected with the developments of the hill region in the country are only too well aware of the lack of adequate infrastructure for transport and distribution and the resultant inability to move large quantities of fruits to the markets from the production centres. Where transportation facilities are available, the loss in transit is estimated to be as high as 30 per cent. Even this figure does not include the value losses resulting from marginal damages that reduce the market price for the fruits in question.

Packaging of fruits and vegetables merely for the purposes of exports received attention in the beginning of the 1970s and there is some movement in this direction. But only a fraction of the total production is exported. This brings into focus the enormous amount of losses that can be prevented in this area which would help the farmer in upgrading his economic status. But as in the case of foodgrains no organised effort is discernible in the direction of packaging for the prosperity of the producer. And, horticulture offers huge potential as it is obvious from the fact that only the states of UP and Himachal Pradesh are producing even now about one million tonnes of apples and other fruits.

Foodgrains : Today the country is reaping the benefits of the green revolution and the agricultural production is of the order of 130 million tonnes and more a year. A substantial portion of this is being distributed throughout the country. While the popular belief is that 80 per cent is consumed nearer the production centres, for home consumption at the farm level, the actual movement involves much more than the balance of 20 per cent in order to meet the needs of the public distribution system and for sale through fair price outlets. Besides moisture loss which is minimisable, large quantities of foodgrains are lost during the distribution system due to inadequacies of transportation, storage and handling systems. A major part of this estimated loss of about 10 per cent is preventable if packaging is improved upon.

To reduce the overall cost to the consumer even within the country, it is essential that the farm sector is made to realise the necessity for improving the packaging techniques. Particularly in the context of the need for creating adequate buffer stocks there is a need to conserve more and this alone should provide necessary motivation for research in this direction.

Likewise, in the exports of foodgrains that are currently taking place, it is unfortunate that no consideration has been given to increasing the value realisation through packaged, graded and branded exports. Higher value realisation, using packaging as an important tool, is possible, and every opportunity must be taken to implement this concept.

Wrap up garden freshness in your tea.

MM WRAP
India's first Biaxially Oriented Polypropylene Film

BOPP Film- the strongest, clearest, thinnest, packaging film. For over-wraps, printing, laminating, metallizing, electrical insulation and for capacitors.

Approved by TOCKLAI EXPERIMENTAL STATION (Six month Interim Report)

MM RUBBER COMPANY LIMITED ● 748, Mount Rd. Madras-2. (Phone : 811501) ● 133, Dr. A.Besant Rd. Bombay-18. (Phone : 375525) ● Jivan Mansion, Ramnagar, New Delhi-55 (Ph : 517682) ● 60, McLeod St. Calcutta-17. (Ph: 247744).

MM WRAP- total protection at one-fourth the price.

MM WRAP (Biaxially Oriented Polypropylene Film) is a totally new concept in tea-chest liners. Recognised the world over as an outstanding wrapping for food products, it is now available in India. At one quarter of the price of foil or aluminised polyester film, 20% less than cellophane and almost the same price as bituminised kraft paper. With better and longer lasting protection than any other tea-chest lining.

Better Moisture Barrier : MM WRAP BOPP film has an excellent moisture barrier. Better than any other packaging film. It can be bent, folded or crushed without any loss of barrier properties, unlike aluminium foil.

Highest Tensile Strength : Even the thinnest gauge of MM WRAP has a very high tensile strength. It gives your tea the protection it needs during transportation.

The Lowest Specific Gravity : It gives more area of film per ton than any other transparent packaging film.

Outstanding Thermal Durability : MM WRAP can be safely employed over a wide range of temperatures and humidity conditions. It has the lowest water vapour transmission rate.

Excellent Barrier Properties : It seals in flavour. And provides total protection against grease, odours and other atmospheric pollution.

Chemically Inert : Totally odourless and tasteless, BOPP film is the only packaging film approved the world over for direct contact with food articles.

Any quantity of MM WRAP is available on demand. Either cut to size or delivered in rolls. Just call us for samples or information on this new packaging material.

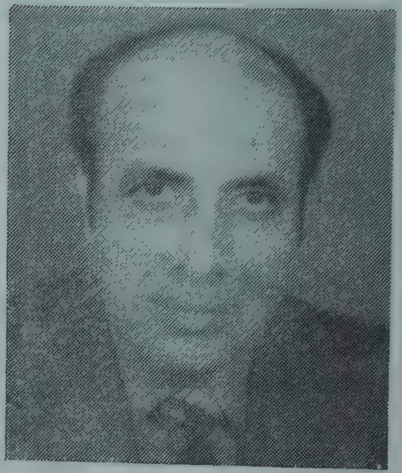
Packaging industry arrests national waste

By R. K. CHOWDHARY



Mr R. K. Chowdhary

IN the ear splitting clamour for arresting the rise in prices, controlling the import bill, maintenance of essential services, industrial relations, *etc*, plans, proposals and strategies to arrest national waste taking place in the Indian economy have not yet qualified to become one of the sensible choices. It is a great paradox that the scarcities of products and commodities are often accompanied by the abundance of wastages, spoilage and losses. No wonder that the scarcities become more acute and create a state of utter helplessness and frustration.

One way to act through the murk is to look beyond the sphere of production and visualise factors that cause physical depletion and deterioration of resources produced at a very high cost. It is the physical supply for industrial and consumer uses needed in far and distant pockets in varying and unpredictable conditions of rain and sunshine and at well regulated and economical prices, that assumes an important and highly relevant role. Proper, adequate and right packaging along with an improved distribution system will make a significant contribution to the conservation of resources and greatly enhance their time and space utilities.

Today, when new industrial units are being promoted, cross-breeds of high yielding commodities researched, new cultures of export being developed, the connections that would facilitate distribution and enable the fruits of production technologies to reach the consumption ends are unfortunately either being ignored or paid a lip service in the national context. It does little good to the reputation of Indian planners, farmers, businessmen, scientists, logistic experts, barons of industry and trade and the Government if goods worth Rs 3,700 crores to Rs 3,800 crores are lost annually due to the impact of climatic, mechanical or micro-biological hazards. Even with such a high incidence of losses — be it be for cement, chemicals, foodgrains, manufactured items, sugar, petroleum products, fresh vegetables and fruits, *etc*, there does not appear to be a significant turnabout in reversing this trend.

This has posed a paradox and is a contradiction to our economic goals — shaping our future growth on the technological patterns of the advanced countries in the West but shunning improvements called for in the transport and distribution facilities. Seemingly, such an imbalance in our emphasis and actions have compounded our mistakes, resulted in confused wisdom and created improper functioning of the life-line of the production system *viz* the system of distribution. The continued impoverishment of infrastructural facilities of transport and communication, health and education, irrigation and power generation, have combined to deprive a mass of people of the fruits of limited development, of which a disproportionately large segment is damaged or spoiled in the distribution system.

Unavoidable waste

Experience all over the world is a pointer to the fact that a vast majority of losses just do not occur by themselves. Their origin can be traced in one form or other to the human factors and failures such as lack of concern, skills, knowledge, application, integrity, efficiency, awareness, technology and proper use of existing facilities. Nearly 70 to 75 per cent of losses are avoidable and can be arrested through development of the right attitudes by people and the application of improved techniques and technology.

In our country, a situation exists where if one is to believe the official records, incidence of losses suffered by the products and manufactured items may even be less than those suffered in most developing countries. The credibility of such phenomena is evidently under the shadow of doubt particularly when analysed in the context of relatively much weaker infrastructural base accompanied by heavy and rough handling, inhospitable climate and more often indifferent concern for arresting losses.

Extent of losses and causes thereof

No authoritative data on the extent of distribution losses is available with a fair degree of reliability. Nor the totality of the claims preferred on insurance companies and transport agencies would, it is felt, portray the true picture of product/produce losses. According to well informed opinion, corroborated by conservative estimates of the official machinery, nearly a tenth of foodgrains produced in the country are lost every year. This coupled with a loss/damage of seven per cent of cement and chemicals; six to seven per cent of sugar; 8 to 10 per cent of fragile items; five per cent of paints and varnishes; five to seven per cent of electrical lamps and tubes; 25 to 30 per cent of fresh vegetables and fruits; 15 to 20 per cent of fish; 15 to 20 per cent of meat; 7 to 10 per cent of eggs; 13 per cent of readymade garments, salt, spices, tea, etc add up to a gigantic figure.

The demands of economic sanity do not call for summary dismissal of these losses on the grounds of their being normal in the distribution system. It is difficult to comment how far a particular cause is responsible for damaging a product. For instance, a tiny puncture in a multiwalled paper bag or a sack containing powdered edible products or rice can be an invitation to rodents, insects, which over a period of time, may render these completely unfit for consumption. An accidental bruise in a general and valuable cargo, like a hi-fi sound system, transistors, automobile spare parts, cigarettes, alcoholic drinks, clocks and watches, garments and other goods may not go unnoticed by the unscrupulous elements and tempt them to pilfer the cargo. Further, a slight damage in packing conditions may make photographic film unfit for use due to the hazard of light and dust. Bruises suffered by soft-skinned fruits due to their interaction with rough and hard surfaces of baskets, wooden boxes etc may change their quality and grade and reduce the rate of unit realisation. Absence of insulation, rise in temperature in closed wagons often shuttled and stationed under the blazing heat of the sun may make the entire load of fresh fruits fully baked and unfit for sale. Woody smell in some consignment of tea, fungus infested leather products, soiled garments, moist salt, sugar, smelly spices, spoiled bread with printing ink marks, etc, are some of the illustrations that bring to light the phenomenon of premature aging, owing its sufferings to the onslaught of a hazard whose impact can

more often be controlled through proper packaging, handling, transportation and storage.

Total approach

The above inference goes to point out that any attempt on identification of causes of losses must take into account a totality of factors and seek solutions and suggestions that embody improvements in all the integral parts of the system. One is likely to be frustrated if an attempt is made in isolation to improve packaging specifications without a frontal attack on poor handling, transportation and storage. At the same time, it is considered that effecting improvements in the methods of handling, hardware of transportation and storage network, call for huge capital investments and have a very long gestation period. Should one wait for these improvements first to take place as a prelude to arrest losses, and thereby allow the orgy of losses to continue unabated? Evidently not!

Improvements in the field of packaging can broadly contain and reduce the incidences of losses inflicted on products on account of hazards of environment through which packages perform their journeys. The environment seldom remains static and is highly variable from country to country and region to region within the country. Packages are dropped from different heights, receive impact on different faces, edges, corners, experience fatigue due to vibratory motions in transit which varies with time and position in the vehicle. Handling equipment subject packages to compressive forces that vary in intensity and the way they are applied. Climatic conditions change during a journey and period of storage and tend to weaken the packages. These coupled with hazards arising on account of attacks by fungi, moulds, bacteria, insects, beetles, moths, flies, ants, termites, rodents, rats, etc wherever applicable, lead to product spoilage. Hazards created by men whose temptations find varying degrees of gratification through pilferage and substitution of products add a further and complex dimension to product losses. At the same time, the products suffer the hostility of other products either moving in the same vehicle or stored in the same place in proximity with each other. For instance, the products may get contaminated by the material of adjacent bags or may be spoiled by leaking the contents of packages containing liquids. These hazards are present in every country. However, their degree and intensity varies. Their ill effects can be greatly reduced by introducing improvements in packaging and related systems of distribution.

Lack of standardisation

In addition, there are even losses that occur due to lack of standardisation in packaging units, which is economically proving to be less productive by adversely affecting handling, storage and transportation of these packages. In the absence of standardised units, a wide range of packages varying in shapes and sizes, in design, methods and materials used for transportation, lead to the necessity of different methods of handling and storage.

Materials handling

One of the greatest single factors responsible for the loss or damage to the product is traceable to poor material handling. It is a matter of great concern and anxiety that very little attention has been or is being paid to such vital aspects. Handling habits are highly individualised in various regions, even then there are basic and minimum norms that need to be observed for protecting the products from the incidence of damage and disintegration. There is enough evidence to show, particularly in many parts of India, that the minimum standards laid down for safety of products are not observed, resulting in loss to life and damage to property.

Handling and storage of fragile products are different from the non-fragile ones. Similarly, handling and storage of liquids requires a different treatment than for solids. Handling by fork-lift trucks, cranes, electrical winches, conveyors, tow-tractors requires different skills and talents in the application of the equipment. Surprisingly, many of the damages suffered by the products have occurred even where every mechanical handling has been resorted to primarily due to deficiency in the operation of equipment and techniques of handling. Seldom do the workers realise that the products are delicate and they often respond to the temptations of lifting or stacking the products with sudden bumps and impact.

No matter whatever be the instruction conveyed regarding the fragility/delicacy of the products, safety of product in handling is seldom considered to be a feature falling within the purview of the handling agencies. The same scenario is reenacted during loading and unloading operations. Stacking of trucks to dangerous heights, filling of space with scant regard for load balancing, absence of concern for the excessive overloading, uncleaned vehicle and wagons, rough handling causing knocks and falls and inverting packages are some of the maladies of many handling operations which are familiar to most of us in the developing countries.

Change in attitude

Brooding over the past in the present is a natural preoccupation. While the validity of comparison is not questioned, it is accepted that such comparisons would prepare an individual, organisation or a country to seek improvement and overcome the problems of the past. Improving standards of packaging and initiating measures for prevention of product losses must commence with the change in attitudes towards the losses. The techniques and technology of packaging improvement would yield better results with a deep craving to effect a change in the attitude from a state of indifference to utmost concern to prevent losses. For this, all the partners in business have an equal responsibility, *i.e.* the producers, workers, package suppliers, handling agencies, hauliers, storage and warehousing personnel, track and road maintenance departments and the public authorities, all must combine their efforts to prevent losses.

To be wrapped in complex motivations of pursuing different goals, though good in isolation, may in the aggregate be reduced if an integrated approach is left out. For instance, the transport authorities seldom exercise a control on seggregating weak packages before these are loaded on to vehicles, wagons, ships or aircraft. Similarly, no handling agency worth the name, in practice, bestows differential care in handling weak packages and or fragile items. It would generally be prudent to conclude that a product/commodity, not well packed for its hazardous journey, from the point of production to the point of consumption, is very much on its own and must not expect any compassion and consideration at the hands of the handler.

Packaging development

There is perhaps no best packaging standard which is universally acceptable or applicable under all circumstances. Usually, packaging development is a step-by-step process. As investigational process proceeds, this will suggest useful modifications from the point of its usefulness in determining shelf life and ability to resist hazardous effects during journey and storage in the distribution system. Any unusual overemphasis on loss prevention in transit may make packaging very expensive and non-acceptable on grounds of economy. Similarly, any underemphasis on packaging may mean total loss of products or partial damage with a consequent reduction in its attributes and properties. A high concentration, by and large, either way may not provide the right answer. What is wanted is to work out a cost factor for packaging that on balance can result in much higher benefits than those con-

The Indothene Promise:

Now IPCL brings you Indothene. Your new name for high quality low density polyethylene. A name that assures you an uninterrupted supply, in a wide variety of grades, for a great many applications.

Indothene—for a wider variety of packaging applications than ever before

Indothene is the ideal material for a great many applications. Take films made from Indothene, for instance. They are lighter, sturdier and more economical than conventional paper bags. They are available in many different sizes and thicknesses to suit virtually all your packaging requirements. Films made from Indothene offer you a unique blend of properties which are difficult to find in any conventional packaging material. They are non-toxic, inert to most chemicals, and therefore, ideally suitable for all types of food and non-food packaging applications. A choice of seven standard grades, from heavy duty to milk packaging to general purpose to high clarity grades.

The unique barrier and heat sealable properties of Indothene find applications in extrusion coating and lamination of various substrates such as—paper, jute, woven fabric from PP/HDPE tapes, cloth and aluminium foils, etc., for industrial, processed foods and pharmaceutical products packaging.

Indothene—the ideal material for household applications

In the moulded products field, a variety of Indothene grades are available for the manufacture of different types of houseware, toys and kitchen items. All in brilliant colours. Due to its easy processibility and lower density, moulded products of Indothene offer higher production rates at lower costs.

Indothene—for energy transmission & communication

Special grades of Indothene are also available for insulation and sheathing of both power and communication cables. The high purity of Indothene grades, coupled with its easy processibility, makes Indothene ideally suited for this application. Here, again, a wide range of Indothene grades are available to choose from.

Indothene—an important input to agriculture and water management sector

Heavy duty low density polyethylene films have already played an important role in both conservation of water and preservation of food grains. A variety of specially designed Indothene grades are now available for the manufacture of heavy duty films for lining of canals, reservoirs, ponds, etc., for water conservation, storage of foodgrains and for many other applications such as nursery bags, plant protection bags, tunnels and greenhouses, silage covers, krishi-hose, drip-irrigation tubings, mulching and soil-reclamation, to name a few.

Indothene—backed by IPCL's exclusive customer technical service

A full-fledged Product Applications Centre is now ready and waiting for you at IPCL. To advise you on everything concerning Indothene and its applications. Whether you're starting a new processing unit or whether you're interested in new, revolutionary applications for Indothene... just talk it over with IPCL.

Indothene

The new name for LDPE.

One great polymer for a great many applications

SAA/IPC/1303C/Rev

sidered in terms of direct cost of a package.

To design a perfect package is not as easy as it appears. Many present day packages predominantly used in the country have many question marks related to their preservation and protection aspect. Seldom have we tried to direct our scientific pursuits to the existing modes and media of packaging. For instance, our traditional material like jute used predominantly for packaging of agricultural commodities and fertilisers, cement, cotton, textiles have not been subjected to scientific research.

From the foregoing, it is amply evident that a total approach to arrest product losses as a prerequisite for achieving results in this important and critical segment of our economy is crucially needed. It is also clear that the improvements called for in the system of transportation, handling and storage are not only capital intensive, but at the same time have a very long gestation period. It will be a herculian task to generate enough capital to meet the desired requirements for the improvements in the infrastructure sector. The point is where is this capital? Neither the capital in the right quantum is available nor in its absence we can afford to permit the orgy of losses to continue unabated. It will be an over statement to suggest that packaging improvements can provide all persuasive answers to the problems. Notwithstanding such an oversimplified approach, one concedes that adequate packaging can, to a considerable extent, minimise product and commodity losses.

It may be almost a foregone conclusion that effective packaging can prove to be highly result oriented in this direction. How and who would bring about effective packaging is a matter of paramount importance. Designing of the effective packaging cannot be left to the desires and whims of an inexperienced person. It seems quite logical to evaluate (i) packages used in various mores and modes of the distribution system; (ii) collect data on the frequency and intensity of hazards during journey and storage conditions; (iii) assess the relevance or otherwise of the packages; (iv) attempt modifications thereof which are duly tested in the laboratories and through simulated field trials, in the context of available indigenous material and skills in the country.

To attempt successfully and meet packaging modifications and innovations with precision and clarity requires a high degree of relationship between the end users, package suppliers, package developers and package researchers. Without such a firm relationship existing between the above there will continue to be many ups and downs in the efficacy and efficiency of packaging standards in India.

Just as the products have to be provided with more exact and standard methods of production and quality, they also need more precise and exact standards of packaging, without which the ultimate purpose of production to reach the right consumer, at the right place, at right time, in right form and quantities and at the right price would be defeated. The development of the agricultural and industrial landscape in India, needs an utmost co-ordination between the protection and production strategies. One without the other will be economically ill-conceived, socially unjust, commercially imprudent and politically confusing. The indifferent and contradictory handling by many authorities in the seat of power bears enough testimony to the fact that they are not aware of the losses taking place nor do they appreciate the role of packaging in partially remedying the situation. It is high time that the campaign to educate the authorities and adopt immediate measures to protect what is produced were launched with vigour and enthusiasm backed by real resources for research and development in packaging.

It's just not possible to get a reliable, automatic copier these days!

Why don't you import one?

Hah! Easier said than done . . .

Why? You're probably eligible for a licence . . .

But it's bound to be awfully expensive . . .

Not if you import it directly from the manufacturer in Japan!

And what about spares and service?

Write to Meco-tronics. They have it all worked out—perhaps better than for some locally available makes . . .

But . . .

You've just run out of reasons for not importing a copier

UP STATE CORPORATIONS

– A FEATURE

Uptron's approach to development of electronics

By K. BHUSHAN

IN pursuit of rapid development of electronics industry in the State, Uptron has conceived following three approaches:—

(a) For building up infrastructure through a number of electronics estates and complexes whereby small and medium scale entrepreneurs could set up manufacturing units.

(b) Setting up joint sector units where medium and large investments are involved.

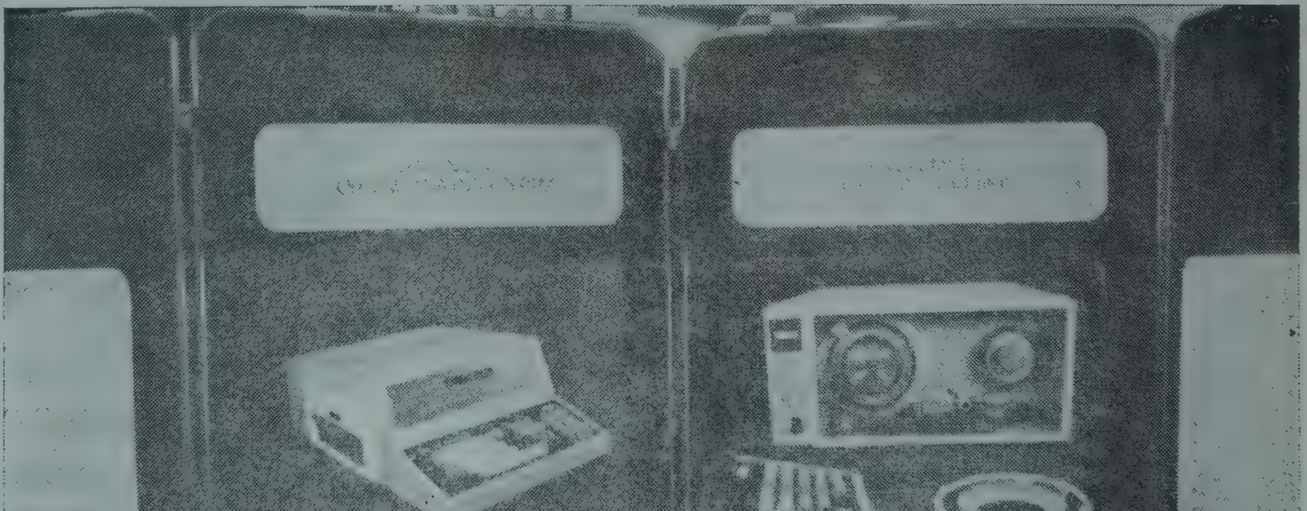
(c) Setting up large public sector units so that these serve as nucleus of growth. To operate such units efficiently so that these can generate surpluses and to use these surpluses for further growth of business activity.

Implementation of strategy

Large number of entrepreneurs are having profitable ventures in Uptron complexes at Kanpur, Rae Bareli, Sahibabad, NOIDA, Bhimtal and Sarojini Nagar, Lucknow. These entrepreneurs get help through multiple assistance plan of Uptron. New entrepreneurs are helped in product identification, preparation of project reports and project profiles through Uptron's consultancy department. Infrastructure Department of the company helps entrepreneurs in liaison with the government departments, assisting them in securing licences and arranging finances through financial institutions. The Testing and Development Centre helps to test the products at very nominal rates and if the product could be manufactured to specified quality the Marketing Division helps to market the products manufactured by such entrepreneurs.

Uptron has established a number of joint sector companies, *viz*, Hindustan Computers Limited, Uptron Electronic Devices Limited, Uptron Anand Limited, Uptron Shreetronix Limited and Uptron Powertronics Limited in the large scale sector. These companies manufacture several products ranging from high reliability polystyrene and electrolytic capacitors to sophisticated computer systems.

In addition to all these promotional activities in which Uptron participates actively, major strength of the company lies in its own successful commercial operations. The company manufactures in its own plants a very wide spectrum of products ranging from electronic components to highly sophisticated digital systems. In its factories at Allahabad and Lucknow the company produces economy and delux models of TV sets, community radio receivers, aluminium electrolytic capacitors, data entry systems, scientific computers, ground water well loggers, data acquisition systems. At its factory at Sahibabad the company produces industrial electronics equipment and systems. The products manufactured in its own factories generate a turnover exceeding Rs 1.2 crores per month. The group turnover this year is likely to exceed Rs 22 crores.



Uptron D-10, a technologically advanced key to Diskette data entry system, along with the MT-10 tape transport unit.

Mr Bhushan is the executive director of Uptron.

Superior on every count The UPTRON Range

UPTRON offers you a high performance range of sleek pocket and desk-top calculators. Combining quality with low prices, unmatched by any other comparable brand. UPTRON®

The cost effective institution.
Bangalore, Bombay, Calcutta, Delhi, Lucknow

Head Office :
10, Ashok Marg, Lucknow 226 001
Phones : 31371, 31372, 31373, 33964, 48131
Telex : UPLC 535-319, Grams : UPTRON

Uptron name synonymous with quality

Whatever products have been introduced in the market by Uptron, are considered of very good quality. In the area of consumer electronics, Uptron television sets are brand leader in the Northern Indian and Western Indian markets. The company will shortly introduce Uptron TV in Eastern and Southern Indian markets.

In the area of digital systems not only has company introduced standard products like data entry terminals but has also successfully commissioned airline reservation terminals all over the country. Today Uptron equipment serves Air India network at Bombay, Calcutta, Delhi, Madras, Bangalore and Trivandrum. In other places the installation work is in progress. A sizable number of custom-built data acquisition systems have been supplied to various state electricity boards during the last one year.

Groundwater well loggers, which have been manufactured for the first time indigenously, have been supplied to several states for their ground water exploration. These have resulted in saving of considerable foreign exchange to the country.

Uptron has entered into export market by commencing export of electrolytic capacitors in January this year. Since then there has been steady flow of export orders which are being executed. The company already holds export orders of 3 million pieces and expects to export at least 5 million pieces during the current year.

Uptron—Cost effective institution

The greatest strength of Uptron is in fact through its successful commercial operations. Though the company spends a very large amount on promotional activities, still it generates substantial surplus as a result of well planned and executed commercial programmes. Just like any other successful business enterprise it is doing so by functioning as a cost effective institution. There is accountability built-in at all levels. Targets and programmes must be achieved which are well monitored and control systems have been designed accordingly.

Research and development

Uptron's stress on research and development and its policy of encouraging innovation in all its activities has been highly productive. Today, most of the production and sales is through in-house developed products.

Each plant carries out its own research and development to improve existing products and to develop new ones The corporate planning division at head office controls and coordinates the overall effort.

Uptron—Strength through its personnel

Uptron holds its success and achievement through technical competence and spirit of dedication of its employees. Uptron has a kind of faith which unites and evolves from objectives and interests common to all its employees and prevails at all levels. It is a kind of faith which welds Uptron into a family which is assuredly realistic.

From its modest success Uptron strives to become a dynamic and large institution, conscious of its obligations to its owners, its employees and above all customers.

PICUP paves path to prosperity

Concluded from page v

with an investment of Rs 50 crores is also proposed to be set up by PICUP in State joint sector.

The State Government has entrusted to PICUP the task of establishing a tool room project in the State to provide facilities for manufacture of jigs and dies required by industries and also to provide training in tool making. The construction work on this project at Lucknow is expected to be completed by December 1981 and the tool room is likely to be operational by early 1982. Assistance in the form of capital equipment from the Federal Republic of Germany is also expected for the tool room project.

To provide industrial information service to entrepreneurs, PICUP has established a well developed data bank for the storage of industrial information in an organised manner and to provide the retrieval services to entrepreneurs and industries in the State. The data bank maintains classified information on different aspects of industry and provides latest information to the officers of PICUP to enable them to guide the entrepreneurs. The data bank also maintains project profiles and feasibility reports on a shelf of projects.

In pursuant of its multidimensional role, PICUP has sponsored the Institute of Management Development, at Lucknow, Uttar Pradesh, to fulfil the needs of industry in general and public sector enterprises in particular in the field of management development and to provide training in modern management techniques to executives of State enterprises, officers of the State Government and entrepreneurs. Courses on various facets of management are regularly conducted by the Institute of Management Development, Uttar Pradesh.

PICUP, the nodal agency for industrial development, thus is poised to welcome industrialists and entrepreneurs to participate in the progress of Uttar Pradesh.

UP Financial Corporation

Concluded from page viii

these factors and as such the Corporation is trying to emerge out as a very vital organisation for the industrial development of the State. The Corporation is planning to disburse loans for more than Rs 200 crores during the plan period.

The Corporation is embarking upon an ambitious programme for the year 1981-82. The business plan of the Corporation is going to be finalised with the approval of the IDBI. Tentatively, the Corporation intends to sanction loans during the year 1981-82 for Rs 45 crores and also disburse loans for Rs 30 crores. During the year 1981-82 the Corporation is also planning to take up rehabilitation of sick units in a big way. If possible, the Corporation will also take over certain sick units and run them through its own arrangement. The Corporation will concentrate on further simplification and rationalisation of its rules and procedures governing the sanction and disbursement of loans. Better systems for follow-up and diagnosing the difficulties of the units at various stages will be introduced. The Corporation will also organise a number of entrepreneurial development programmes and also organise seminars and meetings to educate prospective entrepreneurs about availing of financial assistance from the Corporation to set up new industries.

ENTREPRENEURS!

INDUSTRIAL ASSISTANCE HAS NEVER BEEN THIS FAST.

YOUR IDEAS START TAKING SHAPE THE MOMENT YOU TELL **UDYOG BANDHU** ABOUT THEM

We have 250 product ideas proposed to be established as thousands of projects in U.P. during the VI Plan—115 up to Rs 1 crore, 32 between Rs.1 and Rs.2 crores, 57 between Rs.2 and Rs.5 crores, 16 between Rs.5 and Rs 10 crores and 30 over Rs.10 crores in the areas of fertilizers, heavy inorganic, heavy organic & fine chemicals, limestone & mineral based industries, pesticides, drugs & pharamaceuticals, petrochemicals, fibres, plastics, detergents, synthetic rubber, alcohol based industries, forest and agro based units, paper projects, mechanical and metallurgical industries, engineering industries, electricals, electronics and telecommunications, textiles, dyes and paints etc.

Hundreds of Techno-economic Feasibility reports are already with us. Any new report can be prepared within a couple of months, and technology, land, power and finance tied up and arranged.

Come to U P — it has the most peaceful and largest skilled and unskilled manpowor, abundant raw material, complete infrastructure and the largest market in the Country

Also giving you the largest packet of incentives in the Country—A gift of Rs.90 lakhs for a project. Additionally the requirements of equity, underwriting assistance and term loan fully met/tied by PICUP.

THE SINGLE WINDOW COORDINATION CONCEPT

PICUP, UPSIDC, UPSEB, DI & UPFC HAVE JOINED HANDS TO GIVE YOU A HELPING HAND KNOWN AS **UDYOG BANDHU**

A High Power Committee at the highest administrative level of the Government with PICUP acting as its secretariat, reviews the progress of large and medium projects.

PICUP paves path to prosperity

By S. C. TRIPATHI

THE Pradeshiya Industrial & Investment Corporation of Uttar Pradesh Limited, widely known by its acronym PICUP, was incorporated as a State Government company in 1972 and as a multi-dimension promotional agency and State level financial institution. In a short span of less than a decade, PICUP has opened up Uttar Pradesh to entrepreneurs and industrialists. Financial assistance of over Rs 47 crores has been sanctioned to 167 large and medium scale industrial units involving total investment of about Rs 355 crores with an employment potential of about 50,000 in the manufacturing and over 1,50,000 in the tertiary sectors respectively.

The three dimensional activities of PICUP encompass: (i) Promotional and technical assistance; (ii) Financial assistance; and (iii) Package of incentives.

The promotional and technical assistance rendered by PICUP helps entrepreneurs transform their ideas into reality. The consultancy wing of this corporation helps entrepreneurs in product/project identification, provides locational guidance, assistance in preparation of techno-economic feasibility report and allotment of land in developed industrial areas in the State. Assistance in allotment of steel and cement by Central and State agencies is provided. PICUP also assists entrepreneurs in sanction and release of power.

PICUP has identified 250 medium and large projects for setting up in the State during the Sixth Plan. The investments required for these projects vary from Rs 25 lakhs to Rs 500 crores. Among the larger projects identified are four gas-based fertiliser factories, one aromatic complex, one large petrochemical complex based on higher fractions of gases coming from Bombay High and South Bassein, project for utilisation of Off FCC Gases of Mathura Refinery, polyester fibre project, nylon filament yarn project, caprolactum and DMT project, caustic soda, sulphuric acid and PVC project, ethylene glycol, venyl acetate monomer, 2 ethyl hexanol, calcium carbide and cement projects, paper projects, drugs and pharmaceutical projects, alcohol and pesticide projects, synthetic spinning mills, process houses, high duty transformers, and insulators, power cables, switchgears, manufacture of electronic components etc. Project profiles and detailed techno-economic feasibility reports for most of these projects are either available or under preparation. On behalf of UP Government, PICUP is liaisoning with concerned ministries and public sector organisations of Government of India for setting up the larger projects especially in the field of petrochemicals and fertilisers.

According to a recent decision of UP Government, PICUP is acting as the Secretariat for High Power Committee presided over by Chief Secretary for large and medium sector industries in the State. All concerned departments of UP Government are represented in this committee where the issues are put up after processing of the case by PICUP for a final decision.

As a financial institution, PICUP extends assistance in the form of term loans, equity participation, underwriting and seed capital assistance. For term loans, liberal norms for security margin, equity, debt ratio and promoters' contribution are stipulated keeping in view the location, priority of industry and these norms are suitably relaxed for technical entrepreneurs and non-resident Indians. PICUP also participates with other Central and State financial institutions and commercial banks in extending term loans for medium and large scale industries in Uttar Pradesh. PICUP provides special assistance for underwriting and private placement is also considered. Gap in promoters' contribution for units with an investment up to Rs 100 lakhs set up by new entrepreneurs is covered under the seed capital assistance schemes of IDBI operated by PICUP.

The third dimension assistance by PICUP is in the form of an attractive package of incentives. Fifteen per cent Central Investment Subsidy in Rae Bareli, Faizabad, Lalitpur, Ballia, Basti, Almora and Jhansi districts of the State is extended to medium and large scale industries through PICUP.

Seventy five per cent cost for the preparation of the techno-economic feasibility reports is subsidised under the State Government scheme operated by PICUP.

PICUP also operates the interest free Sales Tax Loan Scheme under which the sales tax paid by new units in the first five years of production in backward areas and three years in other areas is given back as interest-free loan to be repaid in five and three annual instalments after a moratorium of 12 and 10 years respectively. This incentive is also available to existing units going in for substantial expansion. An interest free long term investment loan of up to Rs 25 lakhs is given to units operating outside UP if they set up a wholly owned or 51 per cent owned units in UP.

PICUP provides a special package of incentives for non-resident Indians setting up units in Uttar Pradesh.

An electrical complex located in Rae Bareli has been promoted by PICUP. Ten units manufacturing transformers, HT insulators, transmission line towers, conductors etc to meet the ever increasing requirement of the State Electricity Board set up in the electrical complex are going into production. PICUP is also promoting an Electrical Test & Development Centre to provide testing facilities for high tension transmission line towers, transformers and switchgears. This would be third such facility in the country and the first one in this part of the country.

Besides providing assistance to entrepreneurs, PICUP is participating in industrial growth of the State by setting up joint-sector ventures in specialised industries. Joint-sector project with non-resident Indians for the manufacture of fiberglass by the name of "UP Twiga Fiberglass" has commenced production. This is the second unit for production of fiberglass in the country which has a wide range of application and a number of units utilising fiberglass as the main raw-material are likely to come up. Uttar Pradesh Drugs & Pharmaceuticals Company Limited at Lucknow, PICUP's joint-sector project with Indian Drugs & Pharmaceuticals Limited, for production of basic drug formulations has also gone into production. The Electrical Test & Development Centre, to provide primary testing facilites to units engaged in the manufacture of electrical instruments involving an investment of Rs 522 lakhs is in an advanced stage of planning. A joint-sector project for XLPE and PVC cables involving an investment of Rs 16.55 crores will be established in joint sector with Industrial Cables India Ltd, Rajpura (Punjab), in Mathura, a backward district of the State. Besides these projects, the prestigeous polyester fibre project

U.P. FINANCIAL CORPORATION

14/88, CIVIL LINES, KANPUR.

NOT BEHIND ANYONE IN SERVING THE STATE,

U.P.F.C. pushes the march of Industrial progress of the State ahead by

- sanctioning term loans aggregating Rs 4326 lacs to 2866 units, with an increase of 34.86% over previous year, and
- disbursing loans amounting to Rs 2501.04 lacs, recording a growth of 50.46% over the previous year, in a **single year, 1980-81.**

UPSEB accords automatic power sanction to the units assisted by UPFC and other institutions try to provide support of their services on a preferential basis.

For its activities, the UPFC, inter alia, provides the following assistances :—

- Extends term loans upto Rs 30,00,000/- on low rates of interest and low margin for setting up of small and medium scale industries.
- Provides Foreign Currency loan.
- Grants Composite Loans upto Rs 25,000/- to artisans/handloom weavers/village-cottage industries.
- Provides help in project identification.
- Gives 15% Capital Subsidy in specified backward districts.
- Grants Margin Money Loan to educated unemployed persons and for units to be set up in Industrial Complexes of the State.

UPFC is eager to give you an IDEA to set up an industry and provide you financial support to implement it.

You are welcome to contact us at our :—

Headquarters and other important centres.

MANAGING DIRECTOR

UP FINANCIAL CORPORATION

Progress and targets

THE performance recorded by the UP Financial Corporation in various areas of its activities during the year 1980-81 has been a landmark in the history of the Corporation. In view of the rejuvenated industrial climate created in the State, the Corporation fixed unprecedentedly high targets for the year 1980-81, and in its record performance the Corporation not only achieved the targets but also exceeded them to the surprise of all concerned. With the alround progress achieved by the Corporation both in quantitative and qualitative terms, the Corporation has now achieved a pride of place in the comity of Corporations in general and amongst state financial corporations in the country in particular. The UPFC has achieved highest growth rate during 1980-81 as compared to other SFCs in the country.

Performance

The performance of the Corporation in the main fields of its activities, i.e. sanction, disbursement and recovery, during the last three years has been as given in Table 1.

From Table 1, it will be clear that the Corporation has witnessed phenomenal growth in all fields of its activity during the last two years and particularly during the year 1980-81. The Corporation sanctioned majority of the loans in less than three months' time. All assistance was rendered to the entrepreneurs in selection of a proper item of industry and availing of financial assistance from the Corporation at all stages. In the field of disbursement of loans which can be called the core activity of the Corporation, the Corporation recorded a growth of 60 per cent during the year 1980-81. The gap between sanction of loans and their disbursement has greatly reduced now. Even in the difficult area of recovery the Corporation could achieve a growth of 60 per cent over the previous year, despite many odds experienced by the units in their profitable working as well as by the Corporation in realisation of the dues.

Considering the size of the State and the organisational limitations, the performance recorded by the Corporation compares well with the achievements made by other SFCs. In the area of sanction of loans, our Corporation is bracketed with the leading state financial corporations of the Country, namely, Maharashtra, Gujarat and Andhra Pradesh Financial Corporations but which are operating in comparatively much more improved industrial climate. Similar is the position with regard to the disbursement of loans. Operating under many constraints, like the scarcity of essential inputs such as building materials, coal, oil and power etc, which continued impending the pace of desired industrial growth of the State, the State Government achieved a breakthrough in ushering in a satisfactory climate for industrial investment. The State could also overcome the adverse impact of severe drought faced by it during 1979-80. Further the Industrial Policy announced by the Government of India and the priorities spelt out in the Sixth Five Year Plan, have put at rest various uncertainties and have also created new hopes. All these are contributing to build up a favourable industrial climate in the State. This has obviously helped the Corporation to achieve its goals.

Objectives and strategy

Identifying itself with the objectives set forth in the Sixth Five Year Plan, which accords pointed priorities for the development of industry in the small scale sector, promoting industries having employment potential, rehabilitation of sick units where investments have already been made and also to offer more liberal concessions for the industries being promoted by persons belonging to Scheduled Castes/Tribes, the Corporation during the year 1980-81 introduced certain new schemes and also took measures to rationalise its systems, norms and procedures for dispensing financial assistance. The new measures taken in this regard include decentralisation of functions and delegation of powers to the regional offices, opening of new regional offices, relaxation and simplification in terms and conditions of sanction and disbursement of loans. With the mission to extend service to the entrepreneurs at the nearest point, the Corporation is now operating in the State with 14 regional offices and two branch offices, with at least one regional office in each division of the State. The Corporation is proud of taking such bold lead in the delegation of powers to the functional units. Now the regional offices of the Corporation can sanction loans up to Rs 4 lakhs process loan applications up to Rs 10 lakhs and disburse loans for all amounts and take all follow-up action in regard to a unit.

New schemes

The new schemes as mentioned below, introduced or concentrated upon during the last year, have given a new dimension to the goals before the Corporation and its activities—(i) Composite loan scheme; (ii) Assistance to handloom weavers; (iii) Small road transport operators scheme; (iv) rehabilitation of sick-units; (v) Margin money loan for rural and semi-urban areas; (vi) As-

Table I : Performance of UP Financial Corporation

Items	Achievement 1978-79 Rs lakhs	Achievement 1979-80 Rs lakhs	Target 1980-81 Rs lakhs	Achievement 1980-81 Rs lakhs	Percentage Increase over last year
Sanction of loan	2,484.77	3,320.02	3,500.00	43.26	30
Disbursement of loan	1,088.60	1,668.18	2,400.00	2,500.10	50
Reoovery of dues	476.30	642.36	1,000.00	1,040.00	60

Reg. No. MH-BY/South-38

Licence No. 51

Reg. No. WB/CC-245

sistance from special class of share capital of the Corporation. Brief details of these schemes are given below :—

The most significant aspect of the composite loan scheme introduced in the year 1979-80 is that under it the total credit requirements of a small unit including working capital up to the limit of Rs 25,000 without any margin are met by the loan sanctioned by the Corporation. With a tie-up with UP Handloom Corporation, the Corporation introduced a separate scheme for providing financial assistance to handloom weavers both for purchase of yarn and for aquisition of looms. The terms of this scheme have been made very simple.

The road transport scheme was re-introduced during the year 1980-81 after modification and necessary changes with an intent to promote self-employment and also to promote tourism in the State. The most significant aspect of the scheme is allowing special treatment to the entrepreneurs belonging to SC/ST classes and for the hill regions where the stipulated margin is 15 per cent as against 25 per cent for other categories of entrepreneurs.

In order to promote industries to be set up by the artisans and weaker sections of the society, the Corporation has created a special class of share capital. The scheme envisages providing soft term loan/equity participation up to Rs 2 lakhs or 20 per cent of cost of project whichever is less. The soft loan or equity is to carry a nominal interest/dividend at the rate of one per cent per annum only.

Under its rehabilitation scheme, the Corporation provides various facilities including sanction of additional loan, rephasing the repayment schedule and remission of compound interest liabilities in order to revive the sick units. It also maintains close coordination with other concerned departments of Government and the commercial banks in this regard.

Under the margin money loan scheme for rural and semi-urban areas, loan on soft terms is available to the units coming up in rural areas and towns having population less than 50,000 as per 1971 census. In order to promote employment opportunities including self-employment, the assistance is admissible where investment in plant and machinery does not exceed Rs 1 lakh and to the extent of 10 per cent of the total investment consisting of fixed capital investment, pre-operative expenses and 3 months working capital requirement of the unit or Rs 20,000 whichever is less. In the case of SC/ST class, the assistance will be 15 per cent of the total fixed capital investment.

In order to remove regional imbalances, the Corporation continued its policy of offering concessional assistance for promoting industries in the backward and hill regions. The concessions include reduced margin, longer gestation period and reduced rate of interest. Similar concessions are also available for technical entrepreneurs. In the case of industries being promoted by SC/ST the stipulated margin can be as low as only 5 per cent. Other concessions being offered to this class include ½ per cent rebate on normal rate of interest, applicability of backward area interest rate for the industries being promoted in non-backward areas also and payment of only 50 per cent of processing fee and legal fee.

Development programmes

Special facilities for backward areas : The developmental programmes for creating proper industrial climate in the State continued to form an integral part of the activities of the Corporation. Besides organising industrial seminars and compaigns at district level during the past two years, it organised during 1980-81 two special entrepreneurial development programmes at Agra and Haldwani. For the benefit of small entrepreneurs it is also preparing project profiles in respect of several industries. Through UPICO, it carried out several surveys about the prospect of certain industries like paper and paper products, cold storage, printing, Khandsari and PCC poles, etc.

Seminar on co-ordination

During 1980-81, the Corporation organised a highly representative and successful seminar on co-ordination between banks and term-lending institutions in the area of providing financial assistance to the entrepreneurs. The salient feature of this seminar was to provide adequate opportunity to the entrepreneurs also to put forth their practical problems which helped both the Corporation and the commercial banks to evolve effective mechanism with regard to the appraisal of loan applications, sanction of loans, disbursement of loans, sharing of security, recovery of dues and nursing of sick units.

Staff development

The Corporation has also been alive to the need to tone up the internal system and to train the operating officials in modern techniques, particularly in the appraisal of loans and follow-up. The matter was also taken up with the IDBI to provide necessary guidance. Several short-term training courses where organised by the internal staff to equip the officials with basic and advanced knowledge/techniques required for standard appraisal of loan proposals, legal documentation, disbursement of loans and follow-up.

Future programme

The recent emphasis of the Government on industrialisation efforts, the decision of the Government to set up a number of large scale projects in public sector in the State, to encourage industries in the private sector and to provide base for the growth of industries in the small and tiny sectors have thrown great challenges before the Corporation. The Corporation has to evolve new schemes for the benefit of economically weaker sections of society, generating employment opportunities and for accelerating faster economic growth by industrial production. The Corporate plan drawn by the Corporation for 1980-85 takes into consideration all

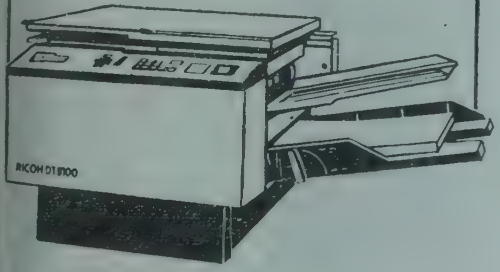
... RICOH Copiers from Japan

If you are an Exporter of goods or services, an R & D Unit, Scientific Research Lab, Educational Institution, Bank, Airline, Insurance Company, Hospital, Chamber of Commerce or Public Sector Enterprise you are eligible to import a Photocopying Machine for your own use.

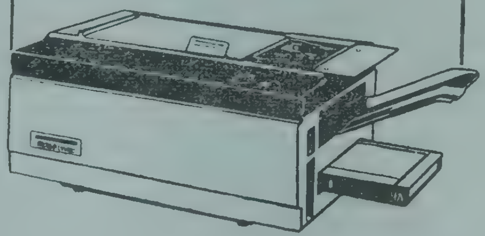
Look closely at Ricoh's exciting new range of Plain Paper Copiers. They feature technology that will soon revolutionize the business machines industry—including fiber optics exposure, touch-sensor keyboards, digital operating panels and microcomputer control. Why settle for less when you can have one of the world's most advanced Plain Paper Copiers at a very realistic price?

Ricoh is represented in India by Meco-tronics with 6 strategically located Branch Offices and Service Centres. Key service personnel at these locations have been trained at the Higashi Matsuyama Technology Center established by Ricoh, near Tokyo, Japan. Expert service is only a phone call away.

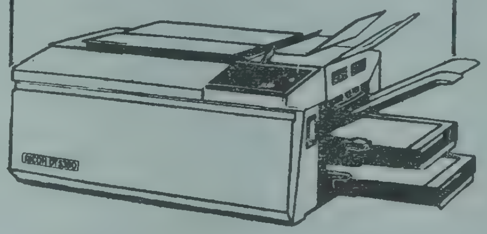
RICOH DT5100 —Delivers the first copy in 7 seconds, and subsequent copies at 12 per minute, in sizes ranging from your letterhead to a f' scap sheet. A compact copier that uses advanced technology to meet the needs of small business houses.



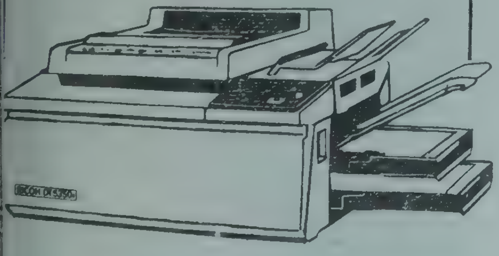
RICOH DT 850 —Delivers the first copy in 5.5 seconds, and subsequent copies at 15 per minute, in sizes ranging from your letterhead to B4 (larger than f' scap). A stationary originals-bed makes copying from books convenient.



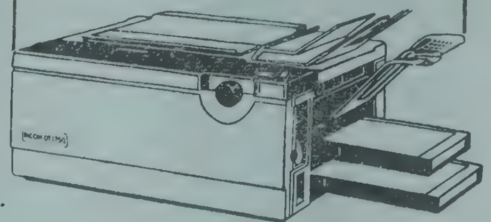
RICOH DT5350 —Delivers the first copy in 5 seconds, and subsequent copies at 30 per minute, in sizes ranging from your letterhead to B4 (larger than f' scap). Features two copy-paper cassettes loaded on machine at all times, for quick changes from one copy-size to another.



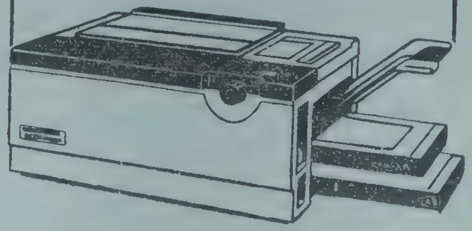
RICOH DT5350 F —Same specifications as the DT 5350 but with a Document Feeder for automatic feeding, positioning and ejection of originals in sheet form. Enhances productivity in copying multi-page documents or reports. Copies can be collated at source by feeding originals in sequential order.



RICOH DT 1750 —Delivers the first copy in 6 seconds, and subsequent copies at 28 per minute (A4 or letterhead size) or 16 per minute (A3 or double-letterhead size). Features two copy-paper cassettes loaded on machine at all times, for quick changes from one copy-size to another.



RICOH DT1800 R —Same specifications as the DT 1750 but with Automatic Reduction of A3 (or double-letterhead) size originals to copies of A4 (or letterhead) size. Stationary originals-bed for convenient copying upto A3 size—and automatic reduction—from books.



RICOH COPIERS High technology at a realistic price.

Plastics for consumer packaging —users' problems

By K. C. R. RAJA

CONSUMER packaging currently absorbs approximately 60,000 tonnes of plastics raw materials a year, accounting for 34 per cent of total consumption of thermoplastics in the country. Plastic packages effect a retail sales turnover of Rs 2,100 crores a year and provide direct employment to approximately two lakh persons and sustenance to eight lakh persons besides generating substantial secondary employment in machinery manufacture, filling, transportation and distribution starting with ICI's LDPE plant at Rishra in 1959. Plastics made rapid strides in the sixties in both consumer and industrial packaging, singly as well as in combination with other materials. Interest in the medium was strengthened by the worldwide trend of declining plastics raw material prices — prices in 1965 were about one-third of the price level in 1950 — and hopes of a similar trend in India in the 1970's with a changeover to larger, petroleum-based units for raw material manufacture. Between 1965 and 1972, plastics did make notable inroads into the packaging of consumer items such as confectionery, vanaspati, talcum powder, motor oil, textiles and garments.

The 1970's, however, saw a distinct slowing down of development activity with the international oil crisis resulting in a rise of over 16 times in the price of crude oil between 1973 and 1980. Efforts to seek new outlets for plastics were dampened by price distortion and supply constraints. Between 1973/74 and 1979/80 plastics raw material prices rose by 240 per cent against an increase of 155 per cent in the official wholesale price index and an even lower 123 per cent rise in the price index for industrial raw materials. The price differential between plastics and other packaging materials underwent a change : tinplate prices recorded an increase of 215 per cent between 1973 and 1980 and glass of 220 per cent while the price of LDPE rose by 250 per cent and that of HDPE by 243 per cent. This was also reflected in a rise in the ratio of packaging cost to retail selling price which discouraged shifts to plastics.

Current scene

Despite these setbacks, plastics is today on the threshold of exciting changes. Availability of new materials like polypropylene, polyester film, nylon ABS, BOPP and milk film and of new processes like coextrusion, injection blow moulding, and stretch blow moulding have opened up new possibilities in several end uses. The versatility of plastics in terms of design and its cost reduction possibilities are being increasingly realised and these can be exploited to promote the package as an effective instrument of marketing. The major advantages are : (a) Light weight and, therefore, easy to store and handle. Plastics eliminate loss through breakage, unlike glass — an important consideration for products with high unit value. (b) Energy saving — energy consumption is lower for plastics; 100 one-litre PVC bottles consume energy equivalent to 8 kg oil compared to 23 kg oil for 100 one-litre glass bottles. (c) Can provide cheap, functional packs for the growing rural market, reducing the cost of physical distribution. (d) Freedom from corrosion. (e) Savings in outer packaging, with consequent saving of freight and insurance. (f) Saving in costs — engineering advances and development of newer materials have enabled convertors to reduce wall thickness and save material without a proportionate loss to performance characteristics.

Prospects

The Perspective Plan for Petrochemicals (1978-88) prepared by a panel of experts from raw material manufacturers, convertors and users has estimated a jump in demand for plastics packaging from 57,000 tonnes in 1977 to 1,49,800 tonnes in 1983 and 2,90,000 tonnes in 1988. The major assumption underlying this growth projection is freer availability of basic raw materials permitting a renewal of R & D and market development efforts. It has been reckoned that with the development of Bombay High/South Bassein regions and the use of Bombay High gas for ethylene and propylene, basic feedstock would not pose problems and that polymerisation capacity would keep pace with the growth of feedstock availability. If these materialise, convertors and consequently users should be able to operate in an era of freer supplies. The major directions of growth for plastics packaging, looking ahead for the next decade, would then be :

a) *Rural markets* : cheap functional packs, unit packs for essential items such as pharmaceuticals, detergents, coffee and milk with the twin objectives of achieving more effective distribution coverage and protecting the consumer against spurious goods.

b) *Prepackaging of produce*: an adjunct to the retailing revolution in the West. Prepackaging could either be packaging the produce in consumer size units at the producing centres prior to transporting them in bulk or packaging at the terminal markets — and could considerably reduce the spoilage of perishables (well over 30 per cent for fruits and vegetables) by extending their shelf life. The additional cost of packaging would be more than offset by the resultant social gain.

c) *Outer packaging* : represents an area of substantial cost reduction particularly with the prospect of material handling systems being adopted widely by consumer goods packagers. Shrink wrapping has made a modest beginning and could well take over a much wider range of consumer goods.

d) *Milk* : the success of 'Operation Flood' in augmenting milk supplies has highlighted the need for efficient distribution in convenience packs. Out of a total milk production of 12,000 million litres a year only 1,600 million litres are accounted for by the organised sector. Milk in sachets, though a recent development, represents 480 m litres or 30 per cent of the organised sectors production. Considering current efforts to extend the reach of this sector; plastics appear to have a major stake in milk marketing.

e) *New processes/materials* : such as thermoforming, stretch blow moulding, PET bottles for large size carbonated beverages would be of immense interest in the context of reducing packaging costs. These are, however, capital intensive and would call for substantial developmental effort in most cases outside small-scale limits of investment, both technological and financial.

Problems of users

It is worthwhile, at this point, considering the problems that users are likely to encounter in continued use/adoption of plastics. A brief study has highlighted the following :

a) *Material availability* : Flow of raw material and consequently of finished packages has been highly erratic because of production problems of raw material manufacturers and failure to plan imports in time. The converter has often oscillated between periods of glut and those of severe shortage.

b) *Consumer acceptance* : The functional and promotional advantage of plastics

---

Mr Raja is commercial manager, The Metal Box Company of India Ltd, Bombay.

have not always been fully exploited. Size, shape and convenience features can considerably enhance consumer appeal particularly in end uses where strong inter brand competition exists. The packer is often handicapped by sufficient know-how to derive full advantage in this respect. Surface decoration potential of plastic packages has also not been fully exploited.

c) *Costs* : The user's total cost of packaging operations, rather than the package cost alone, can be controlled a great deal with provision of filling equipment to achieve faster output, value analysis to determine optimum package specifications and development of appropriate handling systems.

d) *Inadequate information:* Perhaps the biggest handicap is the 'information gap' relating to processing conditions and the possibility of extending usage to other applications.

e) *R & D* : Few packers have their own research and testing facilities to conduct product/pack compatibility tests; package convertors will need to augment this service, especially to their smaller customers.

Role of convertors

The converting industry consists of a large number of small and medium sized units spread all over the country. To sustain the growth momentum, convertors will have to devote themselves increasingly to the following :

a) Sophistication of design to achieve material savings and manufacturing economies.

b) Systems rather than the package : this entails a problem solving approach offering in combination with the package, the means whereby packaging efficiency can be improved and can only be attempted in conjunction with packaging machinery manufacturers.

c) For more sophisticated systems and new processes which involve substantial investment, the convertor will have to be adequately supported by a consistent and assured market — this would involve freer raw material availability and a more realistic excise duty policy by Government to stimulate production and consumption.

Role of raw material manufacturers

Raw material requirements need to be anticipated more accurately and steps taken to ensure timely supplies. A great deal of information needs to be disseminated on physical properties of different grades of materials. Equally necessary is dissemination of information on plans to manufacture new grades (e.g. PP copolymers PVC food grades) and on usage of these grades abroad.

Need for government support

Government has a special interest in plastics as it has emerged as one of the largest suppliers of both the feedstock and the plastic raw matrial and will account for an even higher share of output in the coming years.

As a supplier, Government needs to ensure timely import of raw materials in the short term and adequate capacity creation to take care of long term growth in demand. A Materials Bank could be of considerable help. A Central Information Pool could also keep raw material manufacturers, convertors and users abreast of international trends.

Government support to plastics packaging must, however, come mainly in two areas : price stability and market development. The former appears to be linked to rapid growth in domestic production of crude oil and the latter to encouragement of steps designed to achieve fairer distribution and protection of consumer interest in the vast unprotected markets for essential commodities, perpetually in short supply and sold loose regardless of health hazards, and risk of short weight. It has been estimated that consumers suffer a total loss of approximately Rs 1,600 crores a year on short weight alone. Government's recognition of consumer safety, is reflected in the Weights and Measures Act and the Packaged Commodities (Control) Order and these must be followed by equally effective steps to widen the scope of packaging in mass distribution of basic commodities.

Summing up—action points

a) *Material bank* : to guard against uncertainties in availability that would keep a tab on domestic production and ensure adequate imports.

b) *Price stability* : to enable plastics to compete on the strength of their inherent properties.

c) *Information* : to users on product/pack compatibility to help decide optimum package specifications.

d) *Selective Government support* : by way of a realistic excise policy to encourage low cost packaging.

e) Selective relaxation of licensing constraints where massive investment and R & D effort is required. Current small scale limits will discourage such investment.

f) Active pursuance by convertors of systems selling whereby the package is treated as part of a total system to improve packaging efficiency

g) Finally, the government support to increase the share of packaging in total output of packageable goods in the country bearing in mind the net addition made by packaging to national output in respect of critical, consumer products in perpetual short supply.

Plastics packaging has had a chequered growth in the seventies owing to unpredictable price trends and raw material constraints. The situation is likely to be very different in the eighties and given a reasonably favourable growth climate, freer material availability and concerted industry action should move convertors and users towards technological sophistication and sound market growth.

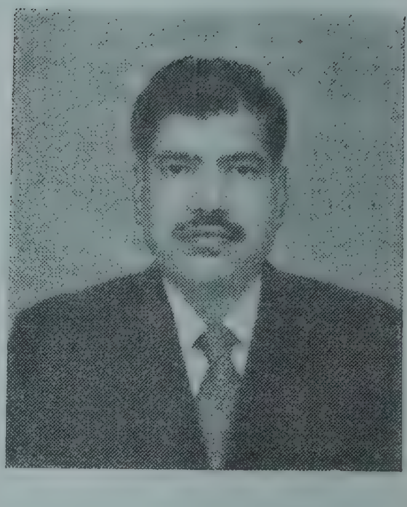
Packaging for fertilisers

By K. SATYANARAYANA



Mr K. Satyanarayana

IN a society that produces foodstuffs and processed and manufactured articles in one locality and uses them in another, a wrapping or container is necessary during storage, transport and sale. Gone are the days when packaging was considered just as a medium to carry the product from place to another. Today it has acquired many more functions and a significant role in the commercial world. The functions of packaging are: 1. To contain a convenient sized unit or amount of a product. 2. To protect it in transit. 3. To aid its safe delivery to the ultimate consumer and 4. In some cases to display the product and promote its sale or to act as a dispenser of it.

Hence, packaging has today become an integral part of production, an essential part of physical distribution and a handy tool for marketing. As such, the packaging industry which was originally instituted to produce simple containers has expanded to encompass a variety of demands of packaging 'matter' in its various forms—gas, liquid solid; eg. cooking gas and Co_2 gas, milk and drinks, chemicals and fertilisers, domestic appliances and heavy industrial components.

Just as its functions and area of operation have magnified over the centuries, so also developments took place in packaging materials. Early transport containers for water, wines and oils like gourds, hollow tree stems and animal skins have yielded ground to new entrants. As Tennyson put it 'the old order changeth yielding place to the new' stronger containers like glass and pottery jars came into vogue later on. Glass bottles and pottery jars were superseded by wooden barrels which were more sturdy and could be made in larger sizes. Wooden boxes and slated crates remain unsurpassed for packing heavy engineering items. Steel and later on FRG containers have claimed pride of place to wooden barrels in the chemical industry. Fibre board drums became a lighter and cheaper alternative to both wooden and steel drums for transporting dry goods.

Similarly, jute sacks have taken over as primary transport containers for agricultural products from the earlier sacks made of wool and cotton. Multi-ply paper sacks received a boost during the War period and later on bituminised sacks became the order of the day. Today, in India, bituminised gunny bags are the major transport carriers of chemicals and fertilisers. Advances in plastics technology made the all-plastics sack possible. Many unit packs can be overwrapped in wraps of kraft paper or in plastic film shrunk to a tight fit by convected or radiated heat. As a result packing offers solutions for transporting not only bulk quantities but also unit packs clubbed into bigger transport packs.

On par with transport packing, unit packing has also made significant strides towards modernisation and development. Glass bottles have been replaced by wax impregnated and polyethylene—lined paper board cartons and polyethylene satchets in the milk trade and soft drink industry. While bottles made of polyethylene and polyvinyl chloride whose contents can be squeezed out are used in toilet preparations, rigid plastic bottles are used for oils and pesticides in smaller quantities. The need to furnish the French army and navy with portable food supplies led to food canning in the nineteenth century. Cans, both tin and aluminium, are now used for ready-cooked products, baby-foods, soft drinks, oils and semi-solids. Aerosol cans, fitted with finger operated valves at the top, are used for a variety of items ranging from pesticides to toilet preparations and paints in spite of the fear that they have a harmful effect on the ozone layer in the atmosphere.

Nowadays non-aerosol spray cans are manufactured to circumvent this danger. The carton being lightweight, collapsible for storage, cheap and disposable and having suitable surface for printing has added a new dimension to packing by providing an easily handled retail unit. Cellophane, plastic and alluminium foil also offer many modes of unit packing which are light, corrosion-resistant and at the same time possess a decorative effect.

Coming to package design, the choice of design is based on functional efficiency and aesthetic appeal. Convenient size for marketing product content, protection and cost are other considerations. The sensitivity of package contents to impact vibration, compressive loading, humidity, temperature, chemical action, bacterial mould, flame and light must also be considered. This is of particular relevence to packaging in India in view of the appalling condition of the highways on which the transport vehicles ply.

All the above developments and considerations have played a role in determining laminated gunny bags as the ideal packaging for fertilisers, chemicals and insecticides. Laminated gunny bags are manufactured by laminating a thin film of LDPE on gunny cloth. Blown bitumen is the adhesive that binds these two together. Once the laminated gunny cloth is ready it is cut into the required size and stitched into bags. It is double stitched to ensure that the contents do not spill out from any end. Lamination ensures that moisture does not seep in and damage the contents and insulates any hygroscopic product from attracting moisture.

In a predominantly agricultural country like India where more and more lakhs of hectares of land is brought under the plough day by day as a result of either the major and minor irrigation works or rural development projects under programmes like ARDP are undertaken by the Government for upliftment of the rural masses, fertilisers have a prominent role to play. As agriculture is the primary source of income over the centuries, fertility of land has come down gradually which has to be replenished every year through fertilisers, and laminated gunny bags ensure that these fertilisers are carried wherever required without any loss of the packed material during transport. A study of the growth of the fertiliser industry during the last three decades justifies the above assertion and gives an indication of the need for laminated gunny bags.

Hence, a steady increase is projected over the years and if more units are set up or existing units are expanded to mop up the deficit the requirement of sacks for packing the same also goes up proportionately. Though all polyethylene bags are also being used on a small scale, laminated gunny bags offer more than a stiff competition because of the inherent advantages they enjoy.

1. Laminated gunny bags unlike the man-made fibre

Mr Satyanarayana is managing director (technical) Hyderabad Bottling Company (P) Ltd.

sacks can be stacked to greater heights. Hence storing does not pose a problem.

2. Second, pricewise they are comparatively cheaper since the alternative is based on petroleum-based raw material. As India has to depend to a large extent on imports for its petroleum requirements our foreign exchange reserves are getting depleted to import the same. Further, any change in the international scene either political or economic cause ripples which have a telling impact on our economy. Hence, laminated gunny bags have a definite advantage over the others as we have many jute mills in India in addition to jute cultivation in the Sunderbans and imports from Bangladesh.

3. Third. name of the contents can be screen-printed in two or three colours easily and can be set off against the brown background with satisfactory results. As the jute fibre absorbs the ink it can obtain a clear print.

In spite of the advantages listed above, the laminated gunny bag industry suffers from two basic difficulties.

1. The laminated gunny bag industry is raw material intensive. About 90 per cent of the cost of the product is the cost of the gunny cloth itself. Hence, fluctuations in the price of gunny cloth can play havoc with production schedules as working capital requirement will be severely hit with a sudden upward revision in prices, and frequent fluctuations are not anything new to the jute industry. The stringent RBI regulations on working capital finances add fuel to the fire.

2. While the above feature is due either to crop pattern or manipulations in the market, the second disincentive is encountered as a result of the Government policy. The taxation pattern adopted by West Bengal is unfair to the manufacturers of gunny bags outside West Bengal. While the sales tax for purchasers within the state is only one per cent, it is four per cent for out of State buyers. Consequently, plants situated outside West Bengal find it uneconomical and extremely difficult to compete with units situated in West Bengal on equal grounds. Survival in the open market with this uneven tax structure is nearly impossible, resulting in the polarisation of this particular industry in West Bengal with its attendant labour and power problems.

While one cannot suggest that West Bengal be deprived of the ST by offering the relief even to out of State buyers, it is improbable to expect the manufacturers to stand upto this uneven competition. However, the local State authorities can offer enough incentives to offset the tax difference in order to promote the industry, increase the wealth of the State and to generate employment. The state authorities should encourage the location of industry by subsidising ST to the extent of relief that is being obtained by manufacturers in West Bengal. It is also in the interest of the fertiliser industry to see that this packaging industry is dispersed all over the country to ensure an uninterrupted supply of bags.

New developments in flexible packaging

By D. D. SHARMA

IN today's highly competitive and showy world, anything and everything must have attractive prices, attractive display, excellent quality and attractive brand name. To satisfy modern sales requirements, packaging systems should protect the goods against mechanical damages, and also should protect the quality of the packaged goods for a long time. A wide variety of packaging materials like paper, paper boards, aluminium foil, PVC, polyethylene, polypropylene, polystyrene are commercially available in the market. These substances if used alone are permeable in various degrees, in the flat condition or after crumpling to water, water-vapour, gases like oxygen, carbon dioxide, aroma (loss or gain of the odour by packaged goods) and oil and fats. Besides this, most of these substances cannot be heat-sealed. To overcome these difficulties, these substances should either be associated between themselves or with certain polymer coatings like PVDC, which provides an excellent barrier to water, water vapour, gases, aroma and fats.

PVDC coated substrates

PVDC coatings are glossy, transparent, colourless, tasteless and involve no toxic hazard even in direct contact with the packed goods. The coatings are scuff resistant also. Due to the chlorine content, PVDC coatings have flame retarding effect. The coatings do not rot and can be heat-sealed at a temperature between 130-150°C. PVDC coated papers have excellent impermeability to water vapour, aroma of items like tea, coffee, *etc*, gases like oxygen, carbon dioxide and oil and grease. They are also impermeable to chemicals, particularly to alkalis.

Polyvinylidene chloride (PVDC) is an aqueous, plasticiser-free copolymer dispersion based on vinylidene chloride and other polymerisable compounds. The different grades of PVDC are compatible with inert mineral colours and special metal pigments. The dispersions can be thickened with acid resistant synthetic colloids which also improves the flow properties. The dispersions are acidic and are anionic. The density varies from 1.25-1.29 gm/cm^2 The average particle size is below 0.24. The dispersions can be diluted with water to any extent.

The Shree Vindhya Paper Mills have taken up the job of manufacturing PVDC coated papers for the first time in India. The trial product is already in the hands of some customers

PVDC coatings are most suitable to produce packing materials for goods which are sensitive to water vapour, gases, *etc*. Any substrate like paper, plastic film, foil, *etc*, can be coated with this copolymer. The papers to be coated with PVDC should have a smooth surface, and a low absorbency. The papers should be sufficiently sized and should have excellent formation. Any type of coating machine equipped with air knife, metering bar, gravure roll or reverse roll may be used to coat the substrates. However, it is necessary to control foam formation by proper adjustment of the machine condition.

Careful control of operating conditions

Foam in the coating produces film of poor impermeability and bad appearance. PVDC dispersions are sensitive to shear force and can coagulate. Shear stresses on the particles, therefore, must be avoided by careful control of operating conditions. Depending upon the substrate and the protection required by the packed goods against water vapour, gases, *etc*. a coat weight of 15-30 gm/m ^{2} gives a satisfactory film. To obtain a film of good flexibility, good impermeability and of good mechanical properties a base coat of softer grade of PVDC is applied to the substrate which is followed by a stiffer grade of PVDC. It is always desirable to apply the entire coat weight in two or preferably in three stages. Whatever be the thickness of the first layer, it is traversed by the fibres emerging from the paper. Besides this, a part of the copolymer is absorbed by the substrate and contains holes in line with the pores of the paper. These fibres and holes provide channels for the penetration of water vapour, gases and fats. Succeeding layers develop a coating film of excellent barrier properties.

The paper coated with PVDC are then dried in the drying tunnel. To obtain a uniform and coherent film of good impermeability the particles of PVDC should deform and interpenetrate during drying operations. The mechanism is called coalescence. The coalescence is directly proportional to surface tension and time and indirectly proportional to particle size and viscosity. In the course of drying capillary force which is imposed by the negative curvature at water surface entraped between the particles acts on the particles. This force helps the particles to move in a viscose flow and brings them together to coalesce.

It is clear that to obtain a film of excellent impermeability rigid controls at the application stage and drying stage are absolutely necessary. The permeability is due to porosity of the material like paper or to its micropores like thin films of foil. Even if these pore, micropores and micro fissures are sealed the penetration of vapours and gases may take place by a three-stage process.

1. Solubilisation of the vapours or gas in the film surface which is in contact with the atmosphere having higher concentration of the gas.
2. Diffusion across the material from the side richer in the gas towards the side poorer in this gas.
3. Desorption from the back face.

The 'big box' is here—but are we ready?

By M. R. SUBRAMANIAN

THE container revolution was heralded into the country in the early seventies by the foreign shipping lines. The picture has radically changed since. Today we are proud of *Indian* container lines. Tomorrow will see Indian owned cellular ships. Besides Indian 'lines', we have domestic production, so far committed for exports, of containers conforming to international standards. Inland container terminals are already being discussed in the southern and northern part of interior India. The 'customs' limits have been relaxed to some extent to provide for door delivery. More relaxation in keeping with the need for speeding up clearance, including of documentation speed up, is on the cards. It seems to be all roses for the Indian exporter. But yet, the industry and trade connected with exports are not yet ready to take maximum advantage of the benefits the 'box' promises.

The container is an intermodal system. It is intended to be carried from door to door *i.e.* from the door of the shipper to the warehouse of the importer overseas, whether both are located at seaports or are reached by land/sea routes. The developed countries and rich developing countries by and large ensure today that the other half is possible. But the problem is with the Indian shipper upto the Indian ports. The handling facilities are not yet installed on the points to be serviced to take care of the loads of 20 to 30 million tonnes at a time.

As the opportunity for filling the container at the point of origin is not utilised, the products require to be packaged in the conventional system, if only, to reach the stuffing point safely. Perhaps, even stronger than conventional packages may be required as the system of stuffing cannot be scientific for a number of reasons, including variety in dimensions of packages to fit into a container, void spaces in the container which are difficult to fill in to ensure safety in transit, etc. Thus, the packaging cost reduction, the main benefit, eludes the exporter.

The third, perhaps an equally important factor, is that relating to maximum use of container capacity. This has a bearing on freight cost and competitiveness of the export product. To fill the container fully with products, the emphasis is on *products*: the package should occupy the minimum space. This is directly related to the material of construction, the shape of the pack and modular dimensions of the pack in relation to the internal dimensions of the container.

The materials of construction of packages, normally involved, using conventional systems of transportation, are timber, steel, plywood, hessian (sacks) and the like. These materials are relatively stronger compared to modern materials that go better with containerised system of cargo. Obviously they are, by and large, more expensive but they are required in the context of the higher incidence of hazards encountered in conventional system of movements. Hessian packages, however, are likely to be less expensive in the Indian context but they result in lower space utilisation within the container capacity available. The other alternative open to the Indian exporter, therefore, is to somehow reach the goods to the stuffing facilities and have these re-packaged in modern materials. This, however, contributes to higher incidence of cost. Apart from this, some of the conventional materials like timber, pose tremendous problems of disposal at the importing markets abroad.

The problem of disposal of conventional materials is not confined only to the developed countries in the world. They are equally a problem even in the rich but industrially less developed countries where labour is quite expensive and hence disposal becomes expensive.

The use of strong packages of timber also demands the use of such ancillary materials like steel straps, which are also treated as hazardous from the point of view of the labour involved in material handling at the destination. Quite often, products packaged in conventional materials are not acceptable to the importers abroad, for they are no more accustomed to handling these and their systems of ware-housing and transportation are not geared to conventional materials as they have gone over to simpler and modern materials for quite some time.

Thus from the point of view of materials of construction the benefit of containerisation cannot be had by the Indian exporter. The other factor relates to the maximum utilisation of the container capacity available. While packages like corrugated board boxes can be made to fine tolerances and they are easily standardisable, it is easier to design their dimensions and produce them with a great amount of accuracy. The more important consideration however is that the volumes occupied by these materials are far less than those taken up by materials like timber, *e.g.* wooden boxes and crates occupy a volume, about 10 to 15 per cent more than boxes made from corrugated board.

The dimensions of the transport packages that are required to be stuffed into containers should be designed in a manner to fit into the length, width, and depth or height of the container (with reference to the internal dimensions). In other words, the dimensions of transport packages used for export will have to be a module of the internal dimensions of the container within which they are intended to be moved. This raises the question of the number of units or related packages which will constitute a bulk package as also the dimensions of the unit packages that contain the product. Therefore, proper utilisation of the container capacity has to start from the dimensions of the primary package, the dimensions of the intermediate package and then the dimensions of the transport package.

Another element of the system is the type of unitisation system adopted. Most developed countries of the world would rather prefer to use unitised loads, such as palletised loads. The reason is that the time involved in the destuffing of non-palletised cargo from the containers is considerable and therefore costs more.

Their system of handling, movement and warehousing uses unit loads as the basis. Standardised pallets are by now conventional for them. This brings in the factor of the pallet dimensions *vis-a-vis* the container dimensions and the need for transport packages to be designed in the manner to fit into the pallet dimensions. Over the years it has been possible to standardise the container dimensions and the pallet dimensions and the Indian exporter will therefore be required to develop the package dimensions in such a manner to fit into both the pallet as well as the container dimensions.

It is, however, true that palletised cargo tends to occupy slightly higher volumes because of the volumes of the pallets involved. But this is expected to be offset by the lower costs involved in the destuffing and other dis-

---

Mr Subramanian is acting director, Indian Institute of Packaging, Bombay.

tribution operations at the destination.

A recent development in this direction is the adoption of the slip-sheet system in the United States and perhaps in course of time, the Indian exporter will have to think in terms of experimenting with this system which provides for lesser volume and therefore greater efficiency of container capacity utilisation.

Some amount of work is of course being done in the direction of developing modular dimensions through the forum of the Indian Standards Institution but the fact is that many exporters are not too keen in preparing for the container revolution by trying to readjust their packaging systems. This may probably be due to their inability to change the unit container sizes as well as the quantities per package. But it is difficult for the Indian exporter to postpone decisions on change any longer.

Likewise, even though containerisation would minimise the compression strength requirements in the transport pack resulting from reduced stack heights to such a low level of 7' 9" approx. within the container, the benefit of such reduction cannot also be taken advantage of by the exporter because of his own ware-housing systems which have not undergone a change and because he cannot have the facility of shipment from his doors in intermodal containers.

It is quite obvious from the above consideration that for the Indian exporter to reap all the benefits that the 'big box' holds for him he has to introduce certain modifications in his systems. This requires a change in the attitudes as much as it involves a change in the various aspects of packaging adopted by him.

The shape of the packages also contributes to either reducing or increasing the volume occupied by the cargo. Packages made from hessian such as hessian sacks, by virtue of the methods of manufacture cannot form rectangular blocks after filling. Compared to multiwall paper sacks they are less efficient from the point of view of space utilisation. Hessian sacks tend to bulge, which are not conducive to proper stowing inside the containers. It is not therefore surprising that some of the Indian exporters find that quantity for quantity (of the product) they can fill much less in a given container than their counterparts in the rest of the world who use gussetted multiwall paper sacks in preference to conventional jute sacks.

The advantage in freight changes the competitors thus enjoy when 'box rate' is applied put the Indian exporter at a definite disadvantage.

Cylindrical packages obviously occupy a higher amount of volume than those of rectangular forms. But it is indeed a difficult proposition for any major shift in this system because of the inherent problems connected with deviations from internationally accepted conventions in this regard. But this is an area which is worthy of being explored further.

Another advantage offered by the system of containerisation relates to reduced pilferages. The break-bulk system that has to be adopted till the point of stuffing of the containers means that the benefit of minimising pilferage is no more available to the Indian exporter. He is bound to continue to provide for fitments to the packaging systems which will reduce the chances of pilferage. His costs will be higher.

A related matter with the advent of containerisation is that of insurance costs. It is common knowledge that when goods are containerised, the insurance premium in respect of the cargo shipped in containers is lower. This is so in most parts of the world. It is also applicable in respect of goods imported into India in containers. Strangely, there has been no significant thought given to reducing the incidence of insurance on export consignments from India when the containerisation system is adopted. Perhaps, it is a little too early for the insurance companies to be sure of the benefits they have been getting from the container revolution. What would appear to be surprising, however, is that no move has been made by the insurance business to popularise this concept through adequate incentives in the form of reduced insurance premiums.

It is obvious that there is a real and urgent need for greater dialogue among concerned interests to find a solution to issues related to packaging in the interests of expansion of export trade making full use of containerisation.

New developments in flexible packaging

Concluded from page 17

The heat sealing of PVDC coated substrates is controlled by the following four factors: 1. The sealing interface temperature, 2. The contact time, 3. The nature of sealing interface, 4. The contact pressure.

Normally, at a temperature of 130 to 150°C when a pressure of 1.4 kg/cm² is applied for one second provides good seal strength. However, care should be taken to avoid overheating which degrades the quality of PVDC film and also may produce an odour which is not desirable.

Alternatives

Besides the substances mentioned, paper/aluminium foil laminates have been quite popular in the market. They can be used to pack the pharmaceutical products, instant coffee, instant soups, biscuits, etc. The interest in this laminate is due to the association of the characteristic of the two substrates: 1. Paper which has good mechanical properties and easy to process. 2. Aluminium foil which has very good appearance and barrier to ultra violet rays, water vapour and gases.

As the aluminium foils above 9 to 10 microns are quite expensive, they are rarely used for the purpose. Thin films of aluminium contain micropores. Although in flat condition, this product has very good impermeability to water, water vapour and gases, yet fat seeps through the pores of the film. In the crumpled conditions, the film is cold drawn and sometimes even breaks and its impermeability is badly degraded. The laminate when coated with PVDC overcomes all these defects. It improves the impermeability, especially after crumpling. The laminate can be heat sealed. Either side of the laminate can be coated with PVDC.

To satisfy the requirement of highly flexible packaging paper/polylaminates are quite popular. They provide good resistance to water and water vapour, but impermeability to gases and fats is very poor. If the laminates are coated with PVDC, the film become impermeable to vapours, gases, aroma and fats. Either side of the laminate can be coated.

PVC and polystyrene films can also be coated with PVDC. Such films have good barrier properties and provide an excellent material for flexible packaging. Special techniques are followed while coating, laminates like paper foil and paper/poly and films like PVC and polystyrene.

As the prices of the packaging materials used by pharmaceuticals or confectionaries are fluctuating like shares in the share market, it is necessary to develop new products which can satisfy the requirements imposed by the modern sales and distribution system. Shree Vindhya Paper Mills have already started work in this direction.

EASTERN INDIA TODAY

Cut in Orissa's Sixth Plan

By **P. C. MAHANTI**

CALCUTTA

IF the Orissa Government is resenting the sharp cut in the Central allocation for the State's Sixth Plan and considers it to be a bolt from the blue, it is fully justified. The entire plan has been drawn up at Rs 1,500 crores only out of which the State itself had agreed to find Rs 775 crores, which is more than 50 per cent of the total outlay. The Centre had originally agreed to provide Rs 725 crores but, in a recent communication, it has informed the State Government that the Central share stands reduced to Rs 660 crores—a straight cut of Rs 65 crores without much justification.

When the Prime Minister, Mrs Gandhi recently went to Orissa to make an on-the-spot assessment of Orissa's plan performance, the Finance Minister of the State submitted a memorandum to her deploring the cut in the Central plan allocation for the State's Sixth Plan pointing out at the same time that the State's tax machinery has been fully geared to raise additional resources for financing the development plans. In fact the State has now fully stretched its direct tax resources, asked the public sector enterprises to produce the maximum surplus they can, and followed all the financial disciplines expected of a State Government, the memorandum stressed.

It is possible that the Centre itself has come under greater financial strain than before and fears loss of revenue buoyancy because of tax reliefs, subsidies and, by and large, unfavourable economic climate. But the Central budgetary position is unlikely to deteriorate to such an extent that it cannot meet its full commitment of Rs 725 crores over a four-year period and a reduction of Rs 65 crores had to be made. This speaks of a penny pinching mentality. An amount of Rs 65 crores could be easily found by economising on projects which are largely wasteful and also by a more efficient planning of public expenditure. The cost overruns in several large central projects, to quote the example of Calcutta Metro Railway as a typical case, have already exceeded hundreds of crores of rupees and all because of poor management and inefficient budgetary planning. Orissa's demand by comparison is indeed small. It is expected that the Prime Minister, if she means to follow a policy of balanced regional development, will consider the Orissa Finance Minister's memorandum sympathetically and have the cut restored.

Orissa is a state where the percentage of people living below the poverty line is the highest of any state in India and where the per capita income falls in the lowest bracket. In fact the gap between the State's per capita income and the national average has kept widening with years. It is a fit case where the policy of balanced regional development needs to be applied first. Rupees 65 crores is a small sum for the Central Government but if the State were to raise this additional amount by further taxation then it would have to impose extra hardship on the people whose taxable capacity has already reached the limit.

Wagon shortage

The Coal Consumer Association of India with its headquarters in Calcutta fears that, in view of the coming heavy import of foodgrains, sugar, edible oils and other industrial raw materials, the railways may have to divert a large number of wagons to move the imports from ports to different destinations in the country. This is likely to affect wagon supplies for coal loading. Coal loading demands the maximum number of wagons from November onwards when collieries work at the peak levels of efficiency. It is precisely during the winter months that imports of foodgrains, sugar and edible oils are likely to land in the country and in heavy quantities at that. The railways cannot meet the demand of this traffic as well as of coal loading satisfactorily at the same time and intelligent planning based on clear cut priorities can alone save the situation.

The Coal Consumers Association has made the following suggestions so that high priority accorded to the prospective unscheduled movement does not result in disruption to the usual traffic or curtailment of wagon supplies to the priority sectors like coal. First of all there should be prior allocation of the least congested ports for unloading of imported cargo and the railways should chalk out the movement programme as well as the wagon allotment schedule well in advance. Secondly, if imported cargo is to be diverted to ease congestion on already congested routes it should be done in a planned manner so that extra congestion does not occur on routes where traffic is not usually heavy. Thirdly, short-term infrastructural facilities should be extended at the unloading ports wherever necessary so that prompt clearance of traffic is made. Finally, the higher imported goods traffic should not on any account lead to curtailment of monthly allotment quotas for industrial consumers of coal who are mostly in a hand to mouth situation in the matter of supplies these days.

The association's representation to the Government about this matter contains a timely warning. If the movement of coal to industrial consumers suffers on account of competing demand from and unscheduled heavy traffic resulting from the coming imports, then not only will industrial production suffer but the coal industry as well. Transport is very much part of the production process in the coal industry as well and any disruption in railway movement of the fuel is bound to disrupt coal production. Sixty-five per cent of the country's collieries are in eastern India and the economy of this region will get a shock if the coal production suffers a setback.

Mini cement plants

The north-east region which has always been experiencing on acute scarcity of cement will have four mini cement plants during the Sixth Plan period. The Planning Commission has cleared four projects one each for Arunachal Pradesh, Nagaland and Assam. The fourth one will be allotted to one of the remaining states but to which one has not been decided yet. These projects involve an investment of Rs 9 crores and together they will have a production capacity of over 300 tonnes per day. The plant in Arunachal Pradesh will be based on the vertical shaft kiln technology developed by the Cement Research Institute. It is likely that the same process will be adopted in the other centre. The process is considered more efficient than the prevailing processes operating in the country.

BOOKS & IDEAS

Regional imbalances in UP

Patterns of Regional Development—A Comparative Study

By Ajit Kumar Singh

Sterling Publishers (P) Ltd., AB/9, Safdarjang Enclave, New Delhi 110 016; Pages 302; *Price Rs* 75.

In our country where balanced regional development has been accepted as one of the most important objectives of planning, the significance of regional studies can never be over-emphasised. What adds greater significance to the subject is that regional imbalances in the country prevail not merely at the state level but also within the states. As a classic example in Uttar Pradesh, one of the largest states in the country, one can find significant difference in the level of development attained in different regions of the State. While the eastern region of UP is very much undeveloped, rural and known for long for its extreme poverty, western UP, particularly the Meerut-Kanpur belt, is one of the most prosperous regions of the country. As both these regions of UP are quite comparable in area, population and resource endowment, a comparative study of economic development in these regions can help to understand and solve the basic issues in regional development.

The author, (Prof) Dr Ajit Kumar Singh of Lucknow University has in the book under review arrived at a systematic study combining both empirical and theoretical approaches to verify the generalisations concerning regional economic inequalities. Covering the period between 1951 and 1975 or a span of 25 years of planned economic development, the study attempts to (1) quantify the differences in the levels of economic development of the two regions, (2) race the rate of growth during the plan period; (3) identify the problems retarding the development and (4) suggest uitable measures for promoting balanced regional development.

The analytical frame of reference dopted in the study is that of 'sector heory'. The differences in the levels of development have been related to the differences in the economic structure of egions and districts. The 'sector theory', t may be added, has been largely applied to nations or macro-regions but has been quite revealing at the micro-level as well.

Within this frame, the growth and problems of major sectors of the economy have been examined. An attempt has also been made to go beyond the 'sector theory' to examine the problem of poverty in a larger perspective and identify the critical variables in economic development and establish links between different segments of the economy.

On account of the considerable intra-regional economic disparities in the eastern and western regions of UP, the author has taken two sub-regions in both the regions on the basis of levels of development. Wherever possible, district-level analysis has also been attempted, which in turn, has helped in highlighting several facts which tend to be concealed at the regional level.

However, he has admitted that a major handicap in conducting the study has been the paucity of literature dealing with the problems of Uttar Pradesh. He has relied mainly on secondary data from official sources. But, as is always the case, official data are published and made available with considerable amount of time lag. Nevertheless, Dr Singh has developed an analytical framework for regional studies wherein a wealth of data has been compressed.

After tracing the development policies in UP under the different plans, the author has pointed out that while weightage was given to backward regions in the matter of allocation of funds, the plans were not prepared on a regional basis nor a regionwise breakup of broad targets attempted. Further, according to him, no technically competent machinery for preparation of state or regional plan was created by the State Government. It was only recently that the State Government has reorganised the planning machinery by creating a State Planning Institute.

While a few public sector industrial projects have been located in eastern UP their impact on regional balances has been minimal as, the total investment has been small. The planning of these projects has been defective as they have not been visualised as nuclei for the development of regional economies. He, however, does not favour encouraging private investment through the creation of overhead facilities on the ground that once investment in social capital is stopped, the region may fall back again to a lower level of income and employment. The necessary preconditions for the success of 'overhead capital approach' like highly responsive market mechanism, high degree of capital mobility and the existence of a vigorous entrepreneurial class are all absent in Uttar Pradesh.

With a view to having a balanced regional development, he has advocated the need to markedly step up the rate of investment in both the regions of UP if the problem of absolute and the relative poverty is to be effectively solved. Resources could be mobilised for this purpose, both from within and outside the State. The strategy of development to be followed should be arrived at by minimising the natural handicaps like floods of the region and expanding overhead capital facilities. Transport and power facilities, if improved, the infrastructure of the region would considerably change resulting in growth of agriculture and industry.

He has further suggested the need to impart training to local entrepreneurs in large numbers and provide them fiscal incentives to set-up industrial units.

Several of these suggestions made by the author to industrialise and develop UP in a balanced manner are nothing new. But, at the same time, they are worth serious consideration by the authorities concerned. The author spent quite some time in studying this problem and his views surely merit attention.

Growth of agro-industries

Agro-based Industries: Performance and Prospects

By Badar A. Iqbal

Printwell Publications, Aligarh, 1981; *Pages* 120; *Price Rs* 40.

Even after three decades of economic planning, a significant proportion of India's population continues to depend on agriculture for its livelihood. Nearly half of India's national product is accounted for by the agricultural sector. In such a situation, agro-based industries could contribute substantially to the advancement of economic life of any developing country. These industries provide a base for a pattern of socio-economic development that can contribute to an all round growth of the economy. In fact, they operate as catalytic agents for development of agriculture and help in bringing the gap between rural and urban areas. For a country in India's position, the path to economic goals involves a synthesis of both agriculture and allied industries.

The book under review consists of thirteen papers which are updated reproduction of the author's articles, published in India's journals and newspapers, which in turn were the outcome of the material collected by the author for his PhD thesis. The articles in this book deal with rubber, tea, jute, sugar, coir, sericulture, coffee and a few other agro-based industries. Wherever possible, the author has given trends in the world production in the industry under discussion, trends in India's production, imports and exports, statewise position, and an analysis of the end-use industries. It is, of course, obvious that each industry demands a somewhat different treatment than any other. The author has well observed this point and accordingly treated each industry as the need demanded.

Thus for example, in the article on the rubber industry, the emphasis is on area under natural rubber, replantation and extension problems. In the article on tea industry, the focus is mainly on regional performance—north-east versus south—exports and prices. Export potential is the main theme in the article on leather and leather goods as also in that on tobacco. The author has also discussed growth constraints on these various industries. At places, he has referred to studies made by institutions such as Indian Council of Agricultural Research (ICAR) and the National Council of Applied Economic Research (NCAER).

Another noteworthy feature of the book is that the author has by and large confined himself to factual presentation, avoiding being partisan and making value judgements. And yet, one can see research-oriented mind working here, having a flair for figures and also a penetrative skill that looks through statistics. The major merit of this compilation of articles is that it provides a fairly vast span of agro-based industries within its covers.

Abhijit Doshi

Rural poverty and unemployment

SIR,—I have seen the comments on my paper—"Full Employment, Reduction in Inequality and Eradication of Parallel Economy" in the *As I see it* feature by Subhash Chandra Sarker published in *Commerce* dated July 11, 1981. The main point that struck me was the assertion in last para of column that "Mr Mehta, not surprisingly, has not been able to put forward any workable suggestion beyond making some very general observations which is capable of myriads of interpretation......etc......etc" I would like to inform you that I have not tried to beg the question.

I am writing another small paper giving full details about the methodology for achieving these objectives quantitatively and qualitatively—how much finance it will require, how much employment each village industry can generate and at what cost. Some excerpts are reproduced below from the same.

"......The productions of these large industries will have to be upgraded, made super, so as to make them fit for export and be exported as these are to be transferred to the village sector. If necessary, best foreign collaborations for this should be obtained as they do in Hongkong, Taiwan, South Korea and other countries. We will have to follow the Japanese, who today are far superior in technology to USA so much so that their productivity is 40 per cent higher than that of USA and 50 per cent higher than Germany and 100 per cent more than South Korea and Taiwan. This will earn thousands of crores worth foreign exchange which will solve our foreign exchange problem as also problem of local finance as new extra productions start in the villages. This will also create more purchasing power all round and in every corner in the villages in the country......"

"......Having gone full steam ahead, for the last thirty years, in adopting large scale and high technology, having become the 10th biggest nation in the world on high technology (according to Finance Minister, Mr R. Venkataraman, we are the 6th), we can now afford to have a pause and think as to what we should do in future, specially when the results have been, due to any cause whatsoever, tremendous increase in the under-employed and unemployed. Meanwhile, during this pause of few years, we may stop any further enlargement of large sector and produce atleast 25 per cent of our necessities in villages in small and home technology and provide employment to the unemployed and under-employed. After this will be the time to again start gradually higher and higher technology even to the levels of Japanese and further. Today to me not to employ our large population is suicidal and dangerous......"

In a small way, I am trying to prepare an integrated model in ten villages, to be extended to 20 and then to 50 villages, but that would be a drop in the ocean. The first five years had to be spent on the organisation to build up the infra-structure. I am now in a position to say that that within the next two years, the people in these ten villages who want employment or work will have adequate opportunities to get it. This would have been perhaps faster if local politics and bureaucracy were not slow and were more helpful. Already cattle-breeding, fodder-production, agriculture, gobar gas, water-supply, house-building and half-a-dozen "home" industries such as *ambar charkha*, tailoring, leather, agarbathi-production, milk processing etc are working; and another half-a-dozen will also start working during the year.

I am extending these activities after six months to another group of ten villages. The effort is to develop a micro-level model to show the feasibility of meeting the problems of unemployment and rural poverty.

I think the solutions suggested by me in my paper are not impossible to implement and thereby to achieve the necessary results, *if* the Government and the administration have the *will*. I am not sure of the existence of this "boldness" and the "will", both on the political and the administrative levels. Can we not take some drastic measures, specially when we have a very popular and powerful Government at the Centre?

Vadilal L. Mehta

AHMEDABAD

To The Editor

LETTERS

COMMERCE WEEKLY
Manek Mahal, 90 Veer
Nariman Road, Bombay-400 020.

The Sandur Manganese & Iron Ores Limited

SPEECH BY SHRI Y. R. GHORPADE, CHAIRMAN, AT THE 27TH ANNUAL GENERAL MEETING HELD ON 25TH SEPTEMBER, 1981.

Ladies and Gentlemen,

I have great pleasure in extending to you a warm welcome to the 27th Annual General Meeting of the Company.

The turnover of the Company reached a record level of Rs. 17 crores for the year ending 31st March 1981, resulting in a net profit of Rs 226 lakhs after providing for depreciation of Rs 98 lakhs, as compared to a net profit of Rs. 224 lakhs after depreciation of Rs. 74 lakhs during the previous year. This result has been achieved in spite of various adverse factors and difficulties, including an average power cut of 30 per cent during the year, which was as high as 79 per cent during the first quarter of the year. The excellent reputation enjoyed by our products, especially our low phosphorous pig iron and ferrosilicon, has enabled the Company to safeguard its working results during the year, and declare a dividend of 12 per cent as against 10 per cent last year. I am grateful to all my colleagues on the Board and the financial institutions for their valuable guidance and support. I am happy that the Board of Directors have, on more than one occasion, expressed their appreciation of the good work done by the Managing Director, Officers and employees of the Company.

I have to, however, bring to your notice that towards the latter portion of this financial year, the Karnataka Government and the State Electricity Board decided on a Sudden and steep increase in the power tariff, by passing an ordinance in November 1980 and by further increasing the rates in February 1981, as a result of which the monthly power bill of the Company has gone up from Rs. 44 lakhs to Rs. 74 lakhs, amounting to an increase in the annual power charges from Rs. 5.3 crores to Rs. 8.9 crores. This is in total disregard of the existing agreement between the Company and the State Electricity Board for supply of power at an agreed rate, on the basis of which it was possible for the Company to attract adequate investment from financial institutions and other shareholders for the establishment of an electro-metallurgical industry in Karnataka, at a capital cost of approximately Rs. 13 crores. It may be recalled that the Company had entered into a 10 year agreement with the Electricity Board in 1968 for supply of power to its 15,000 kVA pig iron furnace, and a 12 year agreement in 1972 for supply of 40,000 kVA power to its Ferrosilicon furnaces. Later the Company itself agreed to a revised agreement, which came into effect from 1975, and which not only increased the power rate, but also provided for a reasonable escalation in power rates every five years, in proportion to the general increase in rates for high tension consumers. As a result of this revised agreement, the power rate was increased from 5.5 paise per unit in January 1975 to 12.71 paise per unit in January 1980 (excluding Central Excise duty of 2 paise for unit and State duty of 0.75 and 0.25 paise per unit for pig iron and ferrosilicon respectively). This rate is revisable upwards in 1985 on the principle of proportionality, which is clearly spelt out in the existing agreement. But, the rates were abruptly and unilaterally stepped up to about 20 paise per unit in November 1980 and to 27 paise per unit (inclusive of Central excise and State duties) in February 1981. The Company has represented to the State Government and the Karnataka Electricity Board in this regard, urging them to take a just and equitable view, consistent with our existing agreement. I do believe that scrupulously honouring commercial agreements is a necessary part of orderly economic development and credibility in any country, and is in the best long-term interest of speedy industrial growth and progress.

As you are aware, our second ferrosilicon furnace went into production in September 1980, completing the Rs 10 crore Ferrosilicon Project for the production of 24,000 tonnes of ferrosilicon per annum in two 20 MVA furnaces. However, as a result of power cut, the Company was able to produce 29,000 tonnes of low phosphorus pig iron and 12,000 tonnes of ferrosilicon during the year. The domestic market for ferrosilicon continues to be sluggish and the import of ferrosilicon by the Steel Authority of India Limited also affected the internal demand. Now, export of ferrosilicon is being permitted but the international prices are not attractive. However, it is expected that the demand for ferrosilicon will pick up both in the internal and external market with the improvement in steel production.

As regards maganese ore, the Company has to maintain a certain level of production in order to sustain its large labour force of about 3000 employees at the Mines, and keep the unit cost of production within reasonable limits. The geological prospecting and quantitative surveys undertaken by the Company have revealed that the reserves of low-grade manganese ore (30 per cent to 40 per cent Mn.) in our mining concession, run into millions of tonnes, and are more than adequate to sustain our present exports and also take care of the future needs of the steel plants in the South. In view of this, the Government of India should reconsider its policy of restricting manganese ore exports, especially of low-grade ores, which are available in abundance and can earn valuable foreign exchange while providing labour-intensive employment. Our mines are geared to a production of about 2 to 2.5 lac tonnes of manganese ore per annum. However, due to export limitations which have weakened the position of Indian manganese ore in the world market, the production and sales of manganese ore of the Company have also been adversely affected. The Minerals & Metals Trading Corporation of India Limited, through whom manganese ore exports are canalised, is working under the same limitations, as a result of which the export of Sandur Manganese Ore during the year was only 86,000 tonnes, apart from 35,000 tonnes supplied to M.M.T.C. at Vizag for blending, and sale of 8,000 tonnes to local ferromanganese producers. Smiore has represented to the M.M.T.C. that they should consider giving a more realistic rupee price to the Company by their retaining only a reasonable commission, so that the foreign prices obtainable for its manganese ore are substantially passed on to the Company, to enable it to sustain its large labour force without incurring losses in the manganese ore division. The Company is also catering to the local demand for its ores from ferroalloy producers. In due course the steel plant at Vizagapatnam and the proposed Vijayanagar Steel Plant in the Sandur-Hospet region are expected to enlarge and strengthen the local demand for our manganese ore. The Company is making efforts to beneficiate its low-grade ores in order to improve its local sales and achieve a better balance between production and sales.

In spite of all the problems that the Company has had to face, it has largely succeeded in maintaining and improving the standard of living of its employees, even under the present inflationary conditions. The Company continues to supply the following essential commodities to its employees at prices prevailing in March 1972: Rice (Rs 1.40 per Kg), Jowar (Re 0.75 per Kg), Tur Dhal (Rs 1.80 per Kg), Jaggery (Rs 1.38 per Kg), Sweet oil (Rs 3.63 per litre), Chillies (Rs 2.96 per Kg) and Gram Dhal (Rs 2.00 per Kg). The difference between these and current prices are subsidised by the Company. A package of these essential commodities, which each employee is entitled to, is supplied at Rs 70/- while it costs Rs 180/- in the open market. The subsidy amount has gone up from Rs 17 lacs in 1979-80 to Rs 31 lacs in 1980-81 and will be Rs 60 lacs in 1981-82. This is the real measure of inflation in terms of some essential commodities which form an inevitable part of consumption. This approach of the Company to protect the worker from the ravages of inflation has been widely welcomed by all our employees and is capable of wider application in the country. The Company also runs canteens at different workspots and supplies eatables at subsidised rates. Idly, Vada and Tea are supplied at only 5 paise each. In addition, revised pay scales were introduced from 1st July 1981 in order to rationalise the salary structure on a scientific job-evaluation basis and ensure adequate annual increments and career progression.

The Company caters to the all-round development of its employees by undertaking a variety of welfare measures in the field of housing, education, health, nutrition, recreation and cultural activities. A sustained effort is made to improve the housing facilities both at the Mines and Metal and Ferro Alloys Plant. Last year about 350 new quarters were completed at the Mines and it is proposed to build another 500 quarters in the coming years. At the Metal and Ferro Alloys Plant, 100 houses have been completed and another 150 are under construction, as part of a modern housing colony at Vyasapuri with facilities such as school, hospital and other amenities. The colony will be completed in a phased manner over the next few years. It shall be our earnest endeavour to make Vyasapuri not only architecturally elegant but culturally rich and sensitive, based on values which reflect the heritage of Karnataka and our country, and are conducive to a happy community living and striving towards perfection. The Company has also introduced a scheme of housing loans to its employees who have put in a reasonable period of service. These loans, not exceeding 40 months' salary, carry a low interest rate and are recoverable in monthly instalments spread over 12 years. This is to enable the employees to own their own houses, which contributes greatly to their sense of security and well-being, at a time when it is becoming increasingly difficult to construct houses out of current savings. Interest free loans are also given to employees to enable them to possess a cycle and a sewing machine.

The Company runs and supports educational institutions at the Mines, Plant and Sandur, and also provides scholarships for post-matric studies to the children of its employees. Particular attention is paid to child-nutrition by supply of milk to all school-going children, as part of a comprehensive programme for the welfare of children, women, disabled and the aged. The Company wants to pay special attention to providing training for skills and productive employment, to supplement the family income of employees. It is already providing extension services in agriculture and animal husbandry with the same objects in view. The scheme to enable employees to maintain a small poultry unit and a milch animal has made very good progress. One thousand family poultry units have come into existence, and more than a hundred employees have been enabled to own and maintain a milch buffaloe, and these numbers are on the increase.

Smiore attaches special importance to the growing of plants and trees wherever possible and to the development of environmental consciousness among its employees. Our Prime Minister, Smt Indira Gandhi, made a powerful plea for the preservation of environment, in her recent address at Nairobi to the United Nations Conference on New and Renewable Sources of Energy. She expressed her great concern for trees by saying: "If the laws of nature are thwarted, renewable sources will be exhausted. The indiscriminate felling of trees had denuded our forests with disastrous ecological imbalances affecting the very quality of life. In its sternest form nature retaliates against the scars of treeless mountain-sides, causing landslides and devastating floods and silting dams and rivers. Rainfall begins to dwindle and the desert resumes its deathly march". Towards the end of her inspiring address, she significantly struck a spirutual note by posing a question most fundamental to the future of mankind: "We speak of renewable resources. Isn't the human spirit the most potent of them all? Let us join in invoking the human spirit, in rescuing it from apathy and resignation and making it buoyant and spontaneous once again". Smiore wholeheartedly joins in the invocation and pledges to do its bit in this exciting challenge of life and renewal.

Thank you, Y. R. GHORPADE

Yeshwantnagar,
25th September 1981.

NOTE: This does not purport to be a record of the proceedings of the Annual General Meeting.

The Calcutta Electric Supply Corporation (India) Limited

Extracts from the Annual Review by the Chairman, Mr. Bhaskar Mitter

The Company's operations had a successful year as will be evident from the Annual Accounts for 1980/81. Our old stalwart power stations added another worthwhile year to their long record of faithful service and delivered during the year a total of 1530 million units to the system compared to 1500 million units last year. This level of generation was achieved despite the handicaps of our ancient plant, and despite our having to take out of service the 50 MW No. 3 Turbo-Alternator unit at New Cossipore Station for major overhaul of the machine, long overdue, including complete rewinding of the generator rotor, its mechanical repair, and retubing of its condenser. Although this Power Station of ours has always been known as 'New Cossipore', in fact it is now a unit of venerable age. The name of the Station is thus somewhat of an anomaly, rather like Calcutta's celebrated 'New Market'.

Whilst the Company's own generation was maintained at the expected level, unfortunately little relief could be given during the year to the public, suffering for so long under the malignant spell of power cuts. Our generation can at present cater for somewhat less than half of Calcutta's requirements, and the balance has to be obtained from other power agencies. The availability of this balance has been most erratic and subject to frequent restrictions. Despite this generally morose background, I would mention that since February this year restrictions on the import of power from DVC has eased appreciably.

The work on our Titagarh Project is progressing steadily. The construction site at Titagarh was a busy hive of activity as a multitude of separate erection jobs made further progress, bringing the ultimate shape of the new Power Station into sharper focus. Erection of the steel structures, a major critical activity, is on schedule. The structures for the first unit have been completed, allowing placing of pre-cast roof slabs and casting of floors at various levels, while the work on the remaining units continues. The top tables for all the four Turbo-Generator units have been cast ahead of schedule. Erection of the Turbo-Generator and its associated auxiliaries for Unit No. 1 is well in hand. Satisfactory advance has been made in the erection of boilers of all the four units, although there have been occasional constraints of materials, and the work on Unit No. 1 has in fact reached an advanced stage. The chimney for the first two units is expected to be ready by December this year. Work is progressing on the demineralisation, coal handling, and ash handling plants; work on the 33 kV switchgear, and C.W. Pipelines is more or less on schedule. The one major problem that we are presently up against is in the construction of the C.W. Pumphouse where there is currently a slippage of about three months because of very difficult soil conditions and constraints of space. Every effort is being made to make up this slippage by working round-the-clock. Barring unforeseen circumstances, we are reasonably hopeful of being able to commission the first unit by December 1982, provided the various manufacturers of plant and equipment on whom we have placed orders do not fall behind their own delivery schedules.

Capital Expenditure including Works-in-Progress during the year totalled Rs. 54.97 crores, which includes about Rs. 44 crores on the Titagarh Project.

To meet the increasing demands for working capital the Company recently launched a Scheme to raise approximately Rs. 9.3 crores by way of Public Deposits and I am happy to report that the entire sum was collected within about five weeks. We have been greatly encouraged by the overhelming response to the Scheme by members of the public and the confidence in the Company they have thereby demonstrated.

The declining trend in unit sales which surfaced in 1977/78 has been stemmed in that a total of 2750 million units were sold in the period under review against 2743 million units during the previous year. Sales to Domestic, Commercial and Medium & Low Voltage Industrial Consumers were marginally better, whereas sales to High Voltage Industrial Consumers suffered a slight decline.

Gross revenue from the sale of electricity increased from Rs. 98.43 crores to Rs. 125.37 crores. The additional revenue accrued partly from the increase in our rates with effect from 16th April, 1980 for all categories of consumers. The increase was necessary in view of the substantial increase in the Company's operating costs, including a 16 per cent rise in basic cost of power purchased from the WBSEB, and also to cover the liability for additional wages to our staff for which a settlement with the labour unions was reached during the year. Apart from an increase effected in June, 1978 to cover the Excise Duty levied by the Central Government from 1st March, 1978, a comprehensive rate revision had last been made in 1976.

Another part of the increase in gross revenue was due to the increase in the fuel surcharge rates so as to cover increases in the cost of fuel used in the Company's Generating Stations as well as those of DVC and WBSEB from whom the Company purchases power. The increase in revenue on account of additional fuel surcharge was, however, off-set by a corresponding increase in the Company's operating costs on account of fuel consumed and electrical energy purchased from outside agencies. The cost of coal consumed by the Company showed an increase of Rs. 388 lakhs mainly because of a substantial rise in freight charges and in basic prices of all grades of coal during the course of the financial year.

Since the close of the year under review a revision of the Company's tariff to High Tension consumers was made with effect from 1st June, 1981 to cover the rise in basic cost of power purchased from DVC and

(*Continued on page* 580)

Leap into the steel age

Concluded from page 538

produced through the APC furnace process. It would take perhaps another half a century for this process to become popular. In case of Pakistan, this process could be of vital importance as it is gas-propelled and gas here is in abundance. But gas-propelled steel plants are still a matter of future proposition.

The present Rs 25,220 million steel mill project at Pipri is the ultimate result of Pak-Soviet agreement which was signed in January 1971. Earlier, based on the feasibility report prepared by Soviet experts, Pakistan had decided in 1969 to set up this steel mills which was to be based on imported iron ore and coke. The offer to help Pakistan in establishing the steel project was made by Premier Alexei Kosygin during his visit to Pakistan in 1968. During the two years from the date of signing of the agreement till the laying of the foundation at Pipri on December 30, 1973, the change of site also took place. It was changed from Buleji to the present site of Pipri at a considerable cost. The argument for changing the site was that the steel mills will spread pollution to the city of Karachi if located at Buleji. However, the original cost of construction with Buleji as the location of the steel mill project was Rs 13,420 million. That was in 1974-75. Now the total cost is Rs 25,220 million.

The escalation in the project cost has also been due to increase in prices of steel, cement and wages, the three main ingredients in setting up a steel plant. The Rs 13,420 million estimate was based on 1972 prices. Another reason for revised cost is the addition of items which were not originally provided. For instance electric and gas pipelines are designed for greater loads. The repair workshops which would have been set up at a later stage are now functioning and producing small parts; originally they were supposed to be obtained from Soviet Union. Similarly the change in the mode of finance has also added to the cost. The Pakistani part of the cost has been raised through debentures on which the total payment of tax would be Rs 1,760 million.

It is believed that delay in the setting up of the project was attributable to an unrealistic schedule which was prepared and followed during the 1973-77 period. The new schedule was decided upon in 1977 and then confirmed by the Soviet experts in 1978. Since then work on the project is going apace. A latest brochure has this to say on the progress of work, "Construction activity on the main plant complexes started in the first quarter of 1976, was proceeding at a leisurely pace and, on overall project basis, only 12 per cent progress was achieved by June 1977". In what looks like a self-adulatory appendage, it goes on to add that during the past two years the progress of work has indeed been spectacular; from a meagre 12 per cent in June 1977, the overall progress in September 1979 has risen to 53 per cent. Now that one blast furnace has been commissioned, this claim can hold on merit.

The steel mills is a gigantic project. Its installations will consist of two coke-oven batteries, two sintering machines, two blast furnaces, two pig casting machines, one mixer, two converters, casting machines, scrap preparation plant, billet mill, hot strip mill, cold rolling mill, galvanising unit and section forming unit. It will have five sections including construction base, metallurgical training centre, infrastructure facilities, main plant and township. The conveyor belt transports twenty tonnes of raw material in 55 seconds. In fact, ship unloading of raw material is the first point from where the process of steel-making starts. To handle a project of this size and complexity of the steel mill was a challenge to Pakistan; particularly so while it did not have enough experience of the varied kind of skills and expertise which would go into building it.

The two most striking features at the site are long conveyor belts because everything here is handled in large quantities and transported through these belts. The other is the underground works which, as one steel mills engineer put it, would be much more than the works above ground. The underground structure has been constructed for the two million capacity.

Imports of coal and ore have been tied up. According to arrangements, which have been finalised, the supply would be arranged from diversified sources. For instance, 35 per cent coal and coke will be obtained from Australia, 27 per cent from Canada, 20 per cent from USA and six per cent from Sharigh coal mines in Pakistan. Similarly iron ore will also be imported from different sources which are likely to be a combination of Australia, Brazil, Venezuela, Canada, India and Liberia. While arranging for raw material; it has been ensured that security of supplies is maintained.

The annual raw material requirements on full production and end products are as shown in Table 1.

Table 1 : Raw materials and end products

Raw Materials	
Imported	
Iron Ore	2,030,000
Coking Coal	1,360,000
Manganese Ore	50,000
Local	
Limestone..	430,000
Dolomite	242,000
Fluorite	4,000
Refractory clay	44,000
End Products	
Billets	260,000/400,000
Hot Rolled Sheets ..	445,000/305,000
Cold Rolled Sheets ..	90,000
Galvanized Sheets ..	100,000
Formed Sections ..	120,000
Total ..	1·015,000
Coke	215,000
Pig Iron	135,000

These products would be able to meet two-third demand of the country by 1984 when full production level of one point one million tonnes is achieved. According to PASMIC estimates total demand in Pakistan by that year would be 1,560,480 tonnes. The rest will continue to be imported. Pakistan would be saving and earning foreign exchange worth two hundred million dollars as a result of the production of steel from this mill. According to an agreement signed with the Soviet Union the surplus steel will be lifted by them thus saving the steel mills an oversized inventory. This agreement has also given a major rescheduling of repayment which has been described by project officials as a "substantial relief". Originally repayments were to start after one year of receipt of equipment. Now they will start after one year of the commissioning of the project. Some of the Soviet equipment which was supposed to be obtained on cash has also been transferred to credit on commercial terms. The USSR also gave 36 million dollars, under this agreement, to the government for other foreign exchange needs. The agreement provides a new rouble-rupee

Table 2: Pakistan's imports of steel products from 1972-73 to 1977-78 and projected demand upto 1984-85 (at 10% growth rate on the import during 1977-78)

Financial Year	Quantity in Tonnes
1972-73	424,818
1973-74	424,446
1974-75	513,611
1975-76	526,683
1976-77	804,142
1977-78	800,776
1978-79	880,854
1979-80	968,939
1980-81	1,065,833
1981-82	1,172,416
1982-83	1,289,658
1983-84	1,418,623
1984-85	1,560,486

parity which would be applied only to half of the Soviet credit. Half of it which had already been utilised before the signing of the agreement is exempt from the new rate of exchange.

One of the severest criticism of the steel mills project has been on the ground of cost efficiency. It has been said that the cost of steel produced in Pakistan would be higher than the cost of imported steel. In that case, it was argued that Pakistani steel will either have to be subsidised or duty on imported steel will have to be further increased. In answer to this criticism the chairman of the steel mills argues that operational results of steel mills as originally projected were based on estimates of landed cost of end-products and not on CIF prices.

Even critics admit that completion and operation of the steel mills will be a great technical and organisational achievement. Large numbers of Pakistanis would pick up sophisticated skills. Even now thousands of Pakistanis are working on the site and both their Pakistani and Soviet supervisors are satisfied with the quality of work.

Pakistan Steel Mills is to last one full half century (50 years). But before it goes into full production it is also necessary to develop down-stream industries which would include four to five hundred foundries, light-engineering units and small workshops. It was sometime ago that a working group had been formed to study the setting up of down-stream industries. The policy in this direction will have to be a package of fiscal incentives, technical back-up and modern methodology.

INCOME-TAX PAYERS
ARE YOU AWARE

A GRIEVANCE CELL is there in the Central Board of Direct Taxes to attend to your complaints promptly? This cell is functioning under the direct control and supervision of Chairman. He personally acknowledges petitions and ensures prompt redressal of tax-payers' grievances.

If you have any legitimate grievances concerning Income-tax. Wealth-Tax/Gift-Tax, Estate-Duty about undue delays in :

*** GRANT OF REFUND**

*** GIVING EFFECT TO APPELLATE ORDER**

*** CLAIM FOR RECTIFICATION**

*** ADJUSTMENT OF PRE-PAID TAX**

*** COMPLETION OF ASSESSMENT**

*** TRANSFER OF ASSESSMENT RECORD**

Please address your petitions direct to :

Shri Jagdish Chand,
Chairman,
Central Board of Direct Taxes,
Room No. 148, North Block,
Central Secretariat,
New Delhi-110001.

Note: **To facilitate action on your petition please quote your Permanent Account Number alongwith your name and address, assessment year and the circle ward in which assessed.**

Directorate of Inspection
(Research, Statistics, & Public Relations)
Income Tax Department, New Delhi-100 001

CORPORATE SECTOR

In the market

Wiltech India

Wiltech India Ltd (Registered office: 51-A Richmond Road, Bangalore 560 025) is offering for public subscription at par 17,14,690 equity shares of Rs 10 each, totalling Rs 1.71 crores. Apart from this, 17,75,310 equity shares of Rs 10 each at par totalling Rs 1.78 crores have been reserved for allotment to the promoters of the company. The subscription list, which opened on September 24, will close on October 6 or earlier but not before September 28.

The company was incorporated in October 1979. It has been jointly promoted by the Karnataka State Industrial Investment and Development Corporation Ltd and Asian Cables Corporation Ltd. It is setting up a project at Belagola near Mysore for the manufacture of 150 million double edged blades, 20 million shaving systems, 0.2 million razors and 5 million plastic razor handles. Commercial production is expected to start by June 1982.

The project cost is estimated at Rs 10.30 crores which will be financed by equity capital of Rs 3.50 crores, term loans of Rs 6.45 crores, state development loan of Rs 20 lakhs and Central subsidy of Rs 15 lakhs.

Malwa Cotton Spinning

Malwa Cotton Spinning Mills Ltd (Registered office: 54-56 Sector 17A, Chandigarh-160 017) is offering for public subscription at par 13 lakh equity shares of Rs 10 each totalling Rs 1.30 crores. The subscription list will open on September 28 and close on October 16 or earlier but not before October 1.

The company was incorporated as a public limited company in December 1976. It was promoted by Punjab State Industrial Development Corporation Ltd and Oswal Woollen Mills Ltd. It is setting up a spinning mill at Barnala, district Sangrur in Punjab with a complement of 24,200 spindles for the manufacture of yarn. Production is expected to start by November 1981.

The total cost of the project is estimated at Rs 8.40 crores which will be financed by equity share capital of Rs 3 crores, term loans of Rs 5.25 crores and central cash subsidy of Rs 15 lakhs.

Arvindkumar Nandkumar

Arvindkumar Nandkumar Ltd (Registered office: 30, Kali Krishna Tagore Street, Calcutta-700 070) is offering for public subscription at par 1.75 lakh equity shares of Rs 10 each, totalling Rs 17.50 lakhs. The subscription list, which opened on September 22, will close on October 3. The company was incorporated as a private limited company in August 1973 and was converted into a public limited company in May 1981. It is engaged in the manufacture of PC concrete poles and RCC poles, pipes etc.

Bhutoria Valve Udyog

Bhutoria Valve Udyog Ltd (Registered office: 8-A, Lindsay Street, Calcutta-700 016) is offering for public subscription at par 2.07 lakh equity shares of Rs 10 each totalling Rs 20.70 lakhs. The subscription list which opened on September 23, will close on October 3 or earlier but not before September 26. The company was incorporated as a public limited company in April 1972 for the manufacture of C.I. castings.

Other developments

Chowgule Steamships

Mr V. D. Chowgule, chairman of Chowgule Steamships Ltd, has said that the working for the first five months of the current year was generally good in view of the company having fixed its ships on charter of the last quarter of the financial year. He was cautiously optimistic about the future trend in the freight market which had received a setback in the recent month or two. He pointed out that the World Development Report 1981 said that the recession in the industrialised countries had probably now bottomed out and recovery would begin in late 1981 or 1982. World export growth could reach 5.7 per cent a year in 1980s. He however sounded a warning against being overoptimistic about a big boom in freight market and said that rather he would prefer a steady and reasonable chartered market which would not give opportunity for undue speculative operations which many a time tempt shipowners to become irrational in ordering new ships.

Mr Chowgule called for a positive shipping policy in the context of the Government of India accepting the shipping target of 10 million grt by 1990 as proposed by the Honavar Committee. He traced the role played by the soft loans granted by the Shipping Development Fund Committee on a long-term basis in the growth of our shipping to 5.7 million grt and said that he was disturbed by reports of the present concept of assistance to shipping industry being questioned at some government levels. He pointed out that all maritime countries extended substantial loan assistance at cheaper rate of interest (3.5 per cent per annum), special development allowance/accelerated depreciation to their shipping. "I would sincerely appeal at the highest levels to the Government of India to take a positive view and let the industry know the policy which would hold good over a period of at least another ten years, say up to 1990, so that industry can accordingly take a planned expansion programme and thus help achieve the target set, namely, of acquisition of 10 million grt by 1990."

He wanted the Shipping Ministry not to wait for clearances including those under the MRTP Act and from the SDF Committee before taking final decision on issuing an acquisition licence and said that the executive decisions should be vested in the Shipping and Transport Ministries. He also failed to understand why when the Government had recently decided that a 100 per cent export-oriented industry which earned foreign exchange need not obtain the various clearances, the same procedure should not be made applicable to the shipping industry.

Dalmia Cement (Bharat): Sales spurt

Sales of Dalmia Cement (Bharat) Ltd for the half year ended June 1981 amounted to Rs 15.58 crores compared Rs 9.78 crores for the half year ended June 1980. The net profit after providing Rs 1.03 crores (Rs 33 lakhs) for taxation was Rs 68.14 lakhs (Rs 25.20 lakhs). An amount of Rs 1.04 lakhs (Rs 4.53 lakhs) is transferred to investment allowance reserve. Production of clinker during the half year ended June 1981 was Rs 1.74 lakh tonnes compared to production of 1.81 lakh tonnes during the half year ended June 1980. Production of cement was 2.38 lakh tonnes (2.05 lakh tonnes) and that of dead burnt magnesite was 34,150 tonnes (24,376 tonnes). Production of iron ore was 1.95 lakh tonnes (1.81 lakh tonnes) and that of cashew kernels was 102 tonnes (84 tonnes). The vertical shaft kiln project at Dalmiapuram is expected to be commissioned shortly.

Standard Chartered Bank: Profit up

Standard Chartered Bank Ltd has earned a net profit of £68.9 million for the six months ended June 1981 compared to £50.9 million for the six months ended June 1980 after providing £58.9 million (£61.1 million) for taxation and £11.4 million (£9.3 million) for minority interests. The interim dividend recommended is 13.8 pence per share (12 pence per share).

Svadeshi Mills pays 20 per cent

Sales of the Svadeshi Mills Company Ltd for the year ended December 1980 increased to Rs 22.43 crores from Rs 21.93 crores in the previous year. The net profit after providing Rs 46.63 lakhs (Rs 43.78 lakhs) for depreciation and Rs 46.50 lakhs (Rs 47 lakhs) for taxation was Rs 75.07 lakhs (Rs 60.81 lakhs). The equity dividend recommended for the year under review is 20 per cent (same). An amount of Rs 17 lakhs (Rs 15.50 lakhs) is transferred to investment allowance reserve.

Central India Spinning earns more

Sales of the Central India Spg Wvg & Mfg Co Ltd for the year ended December 1980 declined to Rs 25.40 crores from Rs 25.49 crores in the previous year. The net profit after providing Rs 39.55 lakhs (Rs 34.61 lakhs) for depreciation was Rs 1.29 crores (Rs 1.22 crores). The equity dividend recommended for the year under review is 10 per cent.

Beco Engineering: Dividend doubled

Beco Engineering Company Ltd has reported higher turnover for the year ended December 1980 at Rs 5.18 crores compared to Rs 3.98 crores in the previous year. The net profit after providing Rs 15.96 lakhs (Rs 12.25 lakhs) for depreciation and Rs 16.08 lakhs (Rs 0.04 lakh) for taxation amounted to Rs 32.31 lakhs (Rs 21.78 lakhs). The equity dividend recommended for the year under review is 12 per cent (6 per cent). An amount of Rs 6.70 lakhs (Rs 7.91 lakhs) is transferred to investment allowance reserve and Rs 36.98 lakhs (Rs 17.20 lakhs) to general reserve.

The company has completed the modernisation of its machine tools plant and is now embarking on the modernisation of its foundry at Batala at a cost of about Rs 62 lakhs. It has received diversification licence for manufacturing plano milling machines.

Sandoz (India): Higher turnover

Turnover of Sandoz (India) Ltd for the year ended December 1980 increased to Rs 53.40 crores from Rs 48.60 crores in the previous year. The net profit was Rs 1.13 crores (Rs 1.43 crores). The equity dividend recommended for the year under review is 11.5 per cent payable on the increased capital resulting from the issue of 2:5 bonus shares. An amount of Rs 72.17 lakhs (Rs 1.03 crores) is transferred to general reserve.

Forthcoming company meetings

SEPTEMBER 26 TO OCTOBER 2

Mettur Chemical & Industrial Corpn. Ltd, Mettur Dam, R. S. Salem District 636402. (*September* 26, 11 *a.m.*)

The profit figures shown in the above statement have been calculated by making, wherever necessary, additions or deductions of various items so as to show the true profit pertaining to the particular year on a uniform and comparable basis. Similar adjustments are sometimee made in other itemes also. Totals may not add up due to rounding off.

EQUITIES

Smart rally

Bombay, September 21

After the sustained fall of the past one month, equities staged a smart recovery during the past week on emergence of hectic short-covering and a firm bull grip. Although the improved levels could not be retained till the close of the week on account of scattered precautionary profit-taking, modest-to-handsome gains were widespread. Activity was better and the undertone was hopeful.

The technical position of the market improved considerably following the consistent fall during the past one month. Besides the passing of the Essential Services Maintenance Bill by the Lok Sabha had a tonic effect on equity sentiment as marketmen hoped that this would help in improving industrial production, especially in key sectors. Corporate reports were also better during the week.

Century flared up from the week's low of Rs 802.50 to Rs 830.50 on influential support. With the closing at Rs 824, the scrip recorded a net gain of Rs 18. Standard shot up from Rs 496 to Rs 521. The closing was, however, at Rs 508 on profit-taking. Even so, the scrip gained Rs 12.

Tata Stel firmed up by Rs 17 to Rs 358 on hopes of early sanction for the proposed bonus issue of two-for-five. TELCO spurted by Rs 27 to Rs 606 on informed buying. GE Shipping hardened by Rs 5.25 to Rs 47.75 on hopes good results for the year ended June 1981. Scindia improved by Rs 2.50 to Rs 25 in view of the impending board meeting.

Premier Automobiles shot up by Rs 36 on the announcement of books closure. Marketmen were expecting a reasonable dividend from the company. The other firm features were Bombay Dyeing, ACC, Khatau, Larsen, Tata Chemicals, Hindustan Motors and Gwalior Rayon. Indian Dyestuff was subdued following the chairman's far from encouraging statement about the current year's outlook at the annual general meeting held on September 16.

In the cash section, popular scrips were firm features. GSFC improved by 11 points to Rs 425 on the company's decision to increase the caprolactum prices. Baroda Rayon, Century Enka, Indian Rayon, South India Viscose, Bajaj Auto, Kinetic, MICO, NOCIL, Piramal Steel and IOC recorded fair-to-substantial gains.

Market Gossip

Subsidy for jute goods exports

NEW Delhi has at last decided to grant an export subsidy for hessian which was left out in the first announcement on resumed cash compensatory support made about a week ago. The cash support for hessian this time is 7½ per cent of the f.o.b. value. Previously hessian enjoyed a subsidy of 10 per cent. However unlike in the previous instance the latest subsidy will be valid up to March next. The export of hessian has been so sluggish that by the end of August last the jute mills carried as high a stock as 47,000 tonnes of this commodity in a record total stock of 147,500 tonnes.

Including hessian, seven varieties of jute goods are now being given subsidies. It is expected that the subsidies will make Indian jute goods more competitive in the world market and exports will begin to look up in the near future. There is a feeling in the jute industry circles that the worst in the current recessationary phase is over and the industry may soon turn the corner. The raw jute market where prices have slumped 15-20 per cent below the support price should benefit from business recovery when the Government is helping the jute industry to regain its prosperity with cash compensatory assistance from the public exchequer.

Preference shareholders seek fair deal

AN appeal has been made by Mr R. M. Ramanathan, president, Madras Stock Exchange Ltd, to the companies whose preference shares are listed on the ecognised stock exchanges in India to eview and revise the rate of dividend nd other aspects which determine the nvestment value of preference shares. He leads that such a revision is called for n view of the sea-change which has been aking place in the respective rates of eturn and other terms and conditions attached to the main corporate investments uch as equity shares, debentures and xed deposits.

The rate of interest on debentures as been successively raised from 11 to 2 per cent and again to 13.5 per cent ith an additional one per cent linked to nhanced equity dividends. At present ompanies are accepting fixed deposits ith a rate of interest between 13 and 5 per cent. Equity shareholders have ready benefitted by way of higher dividends, bonus shares and appreciation in the market values. On the other hand, the preference shareholders have been obliged to suffer severe losses on account of low rates of preference dividends fixed decades ago. The predicament of non-redeemable preference shareholders is the worst.

Mr R. M. Ramanathan has put forth several suggestions to give a fair deal to the preference shareholders. He has suggested immediate redemption of non-redeemable debentures. Alternatively, they may be converted into redeemable debentures as has been proposed by The Tata Iron and Steel Company Ltd.

Gold from China?

IT would appear that there is smuggling of gold into India not only from West Asia but also from East Asia. The customs officers have recently seized 16 kg of gold, half of which is of Chinese origin and the other half from other countries in the area. This gold was mostly brought by passengers from Hongkong and this has made the customs authorities take a strict view about the luggages of passengers coming from Hongkong and the countries on the eastern side. The 'green gate' is no longer open to passengers coming from those airports and they have necessarily to pass through the red gate—which means the luggage is compulsorily examined. It is not as if some Chinese gold was not smuggled into India in the past. But what has surprised the customs officials is that the yellow metal comes in bars of big size, does not bear stamp of any known refinery and its purity is also suspect. The customs authorities were also recently reported to have seized gold from Dar-es-Salaam. The quantity is about one kg. The local dealers say that the entry of gold from Dar-es-Salaam was not so far known to them.

Meanwhile, gold has been ruling quietly steady during the last few days. Earlier this month the price had spurted to Rs 1,780 per 10 gm following big demand from south India and shortages of supplies. However, higher rates attracted heavy inflow of contraband gold and demand from south was also reduced. The price, as a result, retreated to Rs 1,730-1,740 per 10 gm. Traders believe that during this month about two tonnes of gold was smuggled into the country. Besides, 29 kg of gold was unloaded by gold bond holders.

The announcement by the Finance Minister in Parliament that further enquiries would be made in connection with the "cornering" of gold in auctions held during the Janata regime by 20 dealers had no impact on the bullion market. This investigation has been suggested by Mr K. R. Puri, who held an enquiry into the gold auctions after the Congress (I) came into power. Some of the leading dealers, who are supposed to have cornered gold, said that they would welcome an enquiry. They said that the Gold Control Authorities, following reports of cornering of gold, at that time had made thorough searches of traders' premises and books and they had found no evidence of cornering. The income tax department too had conducted raids and searches and they could trace no incriminating evidence.

UNCTAD commodities pact

A total of 55 countries has so far signed the international agreement sponsored by the UN Conference on Trade and Development (UNCTAD) to stabilise commodity prices. The fund is for $750 million and is split into two accounts of which the first $400 million is reserved for the financing of reserve stocks operations and the second is earmarked to pay for research and export promotion measures. As many as 18 countries signed the agreement during the two-week conference on aid for the world's poorest countries which ended in Paris on September 14. The UNCTAD has drawn up a list of 18 commodities to be financed from the fund in some form. But many consider that the fund is too small to have much impact on commodities markets.

COMMODITIES

Cotton subdued

Bombay, September 21

Subdued trading conditions prevailed in the spot cotton market during the past week. Buying interest was confined to a few lots of better quality cottons of the old crop. The buyers were more keen on ensuring purchases of new crop cotton as and when it starts arriving in the market. This is reflected by the interest shown in forward booking of some cottons like MP Y I and CJ 73. Although Baramati cotton from Maharashtra is said to have been readied for the market, indications are that it would take some more time before it becomes available for sale. Thus, there has as yet been no regular quotation of new crop lots in Maharashtra cotton although it is the third week of September.

The government has not waived in import duty in Pakistani cotton but as indicaetd in these columns in the previous week, there was fresh trouble in regard to the import of Pakistan cotton. The customs department would appear to have refused to exempt imports of Karachi cotton from the payment of import duty. The first consignment is expected to reach Bhavnagar port shortly and the customs people there have been insisting on the payment of duty before clearance.

These and other allied problems about cotton imports would appear to have weighed with the chairman, of the Indian Cotton Mills' Federation Mr K. Rajagopal when he suggested at the 23rd annual general meeting of the federation that the raw material situation could be straightened out if imports were allowed freely.

Mr Rajagopal called upon the Government to broadbase the board of the Cotton Corporation of India and revamp its functioning instead of experimenting with the monopoly cotton procurement scheme. He also under-scored the need for stimulating the growth of finer cottons by suitable readjustment of the duty structure.

Reports from Madras indicate that although handloom exports during the current year had been affected by the soaring prices and inadequate supplies of yarn, the export target of Rs 377 crores for the year would be hit thanks to the Tamil Nadu Government arranging through the Southern India Millowners' Association supply of yarn so that the existing contracts could be fulfilled.

Inaugurating a two-day seminar on rotor spinning in New Delhi, Mr Pranab Kumar Mukherjee, Union Commerce Minister, commended the sponsors of the seminar on the selection of theme and added that the open-end spinning system, with its emphasis on the productive use of waste, needed special attention especially as the cotton textile industry was currently passing through a difficult phase on account of the non-availability of the right kind of cotton at reasonable prices. Rotor spinning could meet the challenge of converting wastes into raw materials. The Government's soft loan scheme to provide funds for modernisation was not enough since it was the scientists' research that made modernisation meaningful for the industry, the Minister added.

The following has been the trend of prices of some of the leading varieties of cotton :

(Rs. per candy)

	September 18	August 11
Kalyan	4,660-4,750	4,650-4,800
Saurashtra CO2	4,800-5,000	4,800-5,050
Shankar 4	5,700-6,060	5,760-6,100
Maharashtra H 4	5,450-5,600	5,450-6,000
Maharashtra Varalaxmi	5,325-5,425	5,325-5,425
MP H4	5,300-5,450	5,300-5,450
MP Y 1*	5,000-5,050	5,000-5,050
MP 1007	5,100-6,200	5,150-5,250
MCU 5 Guntur	5,900-6,050	5,900-6,100
CJ 73*	4,725-4,050	..

Yarn declines

Bombay, September 21

A declining trend was noticed in the local yarn market. The prices of 120D NRC, 150D CR, 120D CR and 150D acetate were quoted lower at Rs 53.96, Rs 51.48, Rs 54.23 and Rs 47.62 against Rs 54.38, Rs 51.76, Rs 54.56 and Rs 48.46 respectively in the preceding week. The prices of 150D NRC and 100D SIV, however, remained unchanged at Rs 52.18 and Rs 61.67 respectively.

Jute goods dull despite Central relief

Calcutta, September 14

It is reported from New Delhi that half a dozen jute goods constructions may qualify for cash aid ranging from 7.5 per cent to 12.5 per cent (FOB) value of exports and a formal decision is likely soon. The rates of aid will be in force till March 31, 1982. The reintroduction of the cash aid scheme comes close on the heels of the statements recently made by the Commerce Minister, Mr Pranab Mukherjee in Parliament and the Textile Secretary, Mr Saran Singh, in Calcutta on the subject earlier.

The statements have admitted of huge losses on exports suffered by jute mills—Rs 2,707 a tonne on carpet backing cloth, Rs 1,430 at tonne on hessian and Rs 857 a tonne on sacking.

The jute industry has welcomed the relief which has been sanctioned since by the Centre. The cash compensatory support to the export of certain items has been given with the objective of enhancing the competitive strength of domestic products in the international markets. Carpet backing cloth has qualified for 7.5 per cent, decorative fabrics 10 per cent, yarn and twine 7.5 per cent and cotton bagging 12.5 per cent.

It is expected that export earnings from jute will, therefore, be higher at Rs 400 crores during the current financial year, compared to Rs 327.42 crores in 1980-81. Exports of Indian products have been declining since the beginning of 1980 owing to fierce competition from synthetics and Bangladesh products in the overseas markets. What is worse is that the unit price realisation has also declined sharply. As a result, the industry is stated to be losing more than Rs 10 crores a month.

The happy development, meanwhile, has been the entry of the Soviet Union into the Indian market for nearly 13,000 tonnes of hessian. The price is stated to be Rs 154 per 100 yards. This Russian purchase has been reflected in modest hardening of prices of goods in the Calcutta market. Russia has so far bought 113,000 tonnes of jute goods during 1981-82. The Soviet Union, jute interests feel, will have to buy further quantities if the total amount as provided in the trade agreement between India and Russia is to be completed. The industry feels relieved because the Russian, purchase will reduce the large inventory which mills had to carry at the end of last July.

As for the fibre, the market is dull because mills are not in a position to absorb jute owing to the strained financial position. The Jute Corporation of India has not yet been able to activate its buying. In the meantime, arrival of raw jute from the new crop is strengthening. Unless the JCI begins buying in right earnest, the hardship to growers will aggravate. In any case cultivators may be obliged to dispose of fibre at a discount to collect cash for the forthcoming festive season.

The chairman and managing director of JCI has said that the corporation would mop up 21 lakh bales of fibre from the current season's estimated crop of about 75 lakh to 78 lakh bales under its price support programme. For this purpose the machinery had been strengthened and financial provision made, he said, adding that 30 additional purchase centres had been opened in West Bengal this year.

Groundnut oil scales new high

Bombay, September 21

Groundnut oil prices scaled an all-time high of Rs 165.36 per 10 kg on September 17 and maintained the level till the end of the week, indicating a net Jump of Rs 8.32 from the preceding week. Incidentally,

---

The Calcutta Electric Supply Corporation (India) Limited

(Concluded from page 572)

WBSEB as well as increases in other operating costs such as interest charges.

Discussions with the Unions on a fresh wage agreement have been satisfactorily concluded and the Memorandum of Settlement is being implemented in a spirit of reciprocity and mutuality of interests.

Management development programmes, both in-company as well as external and the training of engineers and supervisory staff for the proposed Titagarh Generating Station were continued throughout the year.

N.B.—This statement does not purport to be a report of the proceedings of the Annual General Meeting.

this was the voluntary ceiling price. The firmness was attributed to local shortage and the uncertain outlook for the new crop groundnut.

The price had started falling sharply since the imposition of the voluntary ceiling in the middle of August and had come down to as low as Rs 150 early this month. The market, however, rebounded during the past two weeks on poor flow of oil from the producing centres.

Groundnut also hardened on account of uncertain outlook for the new crop. Karad bold, Saurashtra bold and Saurashtra quality improved by Rs 7 each to Rs 637, Rs 642 and Rs 647 per 100 kg respectively.

In view of the hardening tendency in groundnut oil, soyabean gained Rs 2.92 at Rs 135 and RBD Rs 2.34 at Rs 116.48 per 10 kg among the imported oils. Palmoleine, however, remained easy and the price slipped back by Rs 3.12 to Rs 137 per 10 kg on increased supplies.

Castorseed and its oils were subdued on lack of export inquiries, while sellers were active. Madras small and Kanpur bold yielded Rs 10 each at Rs 308 and Rs 300 per 100 kg. Castor commercial oil lost 50 paise at Rs 68 and BSS oil 75 paise at Rs 73 per 10 kg.

Linseed spurted in sympathy with the groundnut oil. Linseed bold jumped by Rs 45 to Rs 575 per 100 kg while its oil moved up by Rs 1.04 to Rs 130 per 10 kg.

Among cakes, groundnut expeller, de-oil and cottonseed rose by Rs 25 each to Rs 1,875, Rs 1,525 and Rs 1,650 per tonne.

Comparative prices in rupees per quintal of seeds and per 10 kg of oils:

	19-9-81	12-9-81
G. nut Karad bold	637.00	630.00
G. nut oil	165.36	157.04
Cast. Md. Sm.	308.00	318.00
Cast. oil com.	68.00	68.50
Cast oil BSS	73.00	73.75
Linseed bold	575.00	530.00
Linseed oil	130.00	128.96

Tea : Good demand for CTCs

Calcutta, September 14

At the weekly leaf tea auctions in Calcutta the total offerings of 27,866 packages of CTC teas met with good demand. Dooars brokens met with good demand from the Punjab and Gujarat buyers and sold at firm to dearer rates. The major blenders also lent good support. The USSR continued to operate for the grainy better descriptions. Assam brokens met with good inquiry from the major blenders and the Gujarat buyers. There was

NOTICE

IT is hereby notified for information of the Public that Juggilal Kamlapat Jute Mills Co. Limited proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval for the establishment of a new undertaking for production of 36,000 M.T. per annum capacity Asbestos Cement, corrugated, semi-corrugated, flat sheets, asbestos pipes and accessories etc. Other particulars of the proposed new undertaking are as under :—

1) Name of the proposed Undertaking	Juggilal Kamlapat Jute Mills Co. Limited (Asbestos Cement Products Division)
2) Name of the person (s) or authority/authorities proposing to establish the new undertaking. Whether it is a body corporate, furnish details of its management structure together with those of proposed undertaking	Juggilal Kamlapat Jute Mills Co. Limited, public Limited Company managed by Board of Directors.
3) Capital structure of the applicant person or authority and of the proposed undertaking	The capital structure of the applicant company as on 31.7.1981 is as under.

AUTHORISED CAPITAL :

			(Rs in lakhs)
25,000	4½%	Income Tax Free cumulative preference shares of Rs. 100/- each	25.00
25,000	6%	Income Tax Free cumulative preference shares of Rs. 100/- each	25.00
7,50,000		Equity shares of Rs. 10/- each.	75.00
			125.00

PAID UP CAPITAL :

5,000	4½%	Income Tax Free cumulative preference shares of Rs.100/- each.	5.00
5,000	6%	Income Tax Free cumulative preference shares of Rs. 100/- each.	5.00
4,87.500		Equity shares of Rs. 10/- each.	48.75
			58.75

The proposed undertaking will be a division of the applicant company and, therefore, will not have separate capital structure.

4) Proposed location of the new undertaking	In any backward district of M. P.
5) Brief outline of the cost of project the scheme and sources of finance.	PROJECT COST :

(i) Land	Rs. 5 Lacs
(ii) Building	Rs. 110 Lacs
(iii) Machinery	
Indigenous	Rs. 210 Lacs
Imported	Rs. 200 Lacs
(iv) Working capitals	Rs. 50 Lacs
(v) Pre-operating expenses	Rs. 25 Lacs
	Rs. 600 Lacs.

SOURCE OF FINANCE :

(i) Rs. 142 lacs from internal sources
(ii) Rs. 283 lacks borrowings from Banks and financial Institutions.
(iii) Rs. 175 lacs Deferred payment from Macinery Suppliers/foreign exchange loans.

Rs. 600 lacs.

Any person interested in the matter may make a representation to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this Notice, intimating his views on the proposal and indicating the nature of his interest therein.

selective inquiry from the local buyers and the Gulf for the better liquoring lines.

The market for fannings was similar to that of brokens. The ARE was fairly active with good support from the major blenders. There was some inquiry from the UK shippers. The internal buyers operated selectively.

The 9,956 packages of Darjeeling teas offered met with good demand. Whole leaf grades continued to be absorbed by the USSR with selective inquiry from the other traditional exporters at around last levels. Bolder and stalkier varieties were taken by one of the blenders at last levels. Brokens met with inquiry from the USSR as well as the UK and the internal buyers at firm to occasionally dearer rates. Fannings followed a similar trend being taken by the UK and the local dealers.

The 61,540 packages of orthodox tea offered met with better demand. Orthodox brokens met with good demand and sold at fully firm rates. The USSR was active with selective support from Poland and the Gulf.

Mixed trend in grains

Bombay, September 21

A mixed trend featured trading in food grains in the local market.

In cereals, wheat (superior) ruled steady at Rs 270-295 per quintal. The undertone was hesitant. The Saurashtra variety eased by Rs 6 to Rs 205-228 per quintal because of good inflow of about 2,500 bags per day. Sellers were active but demand was at a low ebb.

Activity in rice was limited. Demand was slack. Sellers were reserved because of poor arrivals at the producing centres. The Basmati variety was quoted steady at Rs 500-700 per quintal. Export demand was slack. The Surti kolam variety was quoted steady at Rs 340-400 per quintal.

In coarse grains, a steady trend was evident. Prices ruled steady. Receipts were poor. Jowar was traded at Rs 190-235 per quintal, bajra at Rs 190-250 per quintal and maize at Rs 185-190 per quintal.

Among pulses, gram hardened by Rs 3 at Rs 390-411 per quintal. Masoor dal showed a nominal increase of Rs 3 per quintal over the week to Rs 490-495 per quintal. Moong (chumki) receded by Rs 25 per quintal to Rs 335-425 per quintal on account of pressure of supply. Inflow of new moong crop was good. Tur dal and urad (Khandesh) maintained last week's levels of Rs 450-575 per quintal and Rs 310-315 per quintal respectively.

Sugar quiet

Bombay, September 21

Sugar prices in the local market moved within a narrow range. The price of sugar C-30 grade eased by a rupee to Rs 545-560 per quintal. This was attributed to bearish advices from producing centres. The activity was maintained on sustained demand. The undertone was steady. The sugar stock with the city dealers dropped from 3,354 bags to 2,477 bags at the close of the current week. The price of C-30 grade as on September 19, 1981 was lower by Rs 297 per quintal than on the corresponding date a year ago.

The co-operatives were anxious sellers in view of the larger quota released for the month. The State Co-operative factories quoted both grades at around Rs 530-535 per quintal as compared to the opening levels of Rs 520-525 per quintal.

The Khandsari stock dropped from 603 bags in the preceding week to 396 bags at the close of the week. Prices were quoted in the range of Rs 400-500 per quintal for inferior and superior grades.

Gold and silver decline

Bombay, September 21

Both gold and silver recorded a fall in the Bombay bullion market during the past week.

Standard mint gold which opened at Rs 1,760 per 10 gms closed at Rs 1,748 per 10 gms. Ready silver (.999 fineness) opened at Rs 2,765 per kg and gradually drifted to close at Rs 2,725 per kg.

Money easy

Bombay, September 21

Conditions were easy in the Bombay short-term money market during the past week. Both notified and commercial funds which opened at ten per cent declined sharply to five per cent on September 17. However, the interest rates recovered to 9.5 per cent on September 19, before closing at nine per cent.

Bank credit, aggregate deposits expand

Bombay, September 21

Bank credit of scheduled commercial banks expanded by Rs 19.38 crores to Rs 26,783.75 crores during the week ended September 11, 1981. Aggregate deposits increased by Rs 48.79 crores to Rs 41,121.90 crores. The balances with the Reserve Bank of India (RBI) increased by Rs 277.2 crores to Rs 5,031.56 crores and their borrowings from the RBI increased by Rs 10.47 crores to Rs 585.68 crores.

SHARES AND DEBENTURES QUOTATIONS AS ON 30-6-1981

Abbreviations and notes:—P.O.=Preferred Ordinary shares, N=Nominal quotations c.d.=um-Dividend, x.d=Ex-Dividend, c.r.—Cum-Right x.r.=Ex-Right, ...=Not available, n.a.=Not applicable

Shares: If a company has different classes of shares—as for example 'A' shares and 'B' shares—These are indicated by the same letters 'A' and 'B' under the columns 'Paid-up Ordinary Capital' nd Paid-up per share'.

Accounts:—Figures in the 'Accounts Closed' column represent the months of the year in which he respective companies close their accounts. 6 and 12 for instance, indicate the months of June and December respectively. The information on paid-up capital, reserves, gross block, depreciation and profit/loss carried forward relates to the latest accounting year for which the information on dividend per ordinary share is given.

Reserves include general and other reserves and all other funds which a company may have excluding depreciation fund, reserves for tax liability and provident fund.

Gross block represents actual cost of land, buildings, machinery and all other items on which depreciation is allowed less sales, if any and stands for the gross figures except where otherwise indicated Figures in brackets given below gross block represent the values of work-in-progress included in gross block on which depreciation is not provided

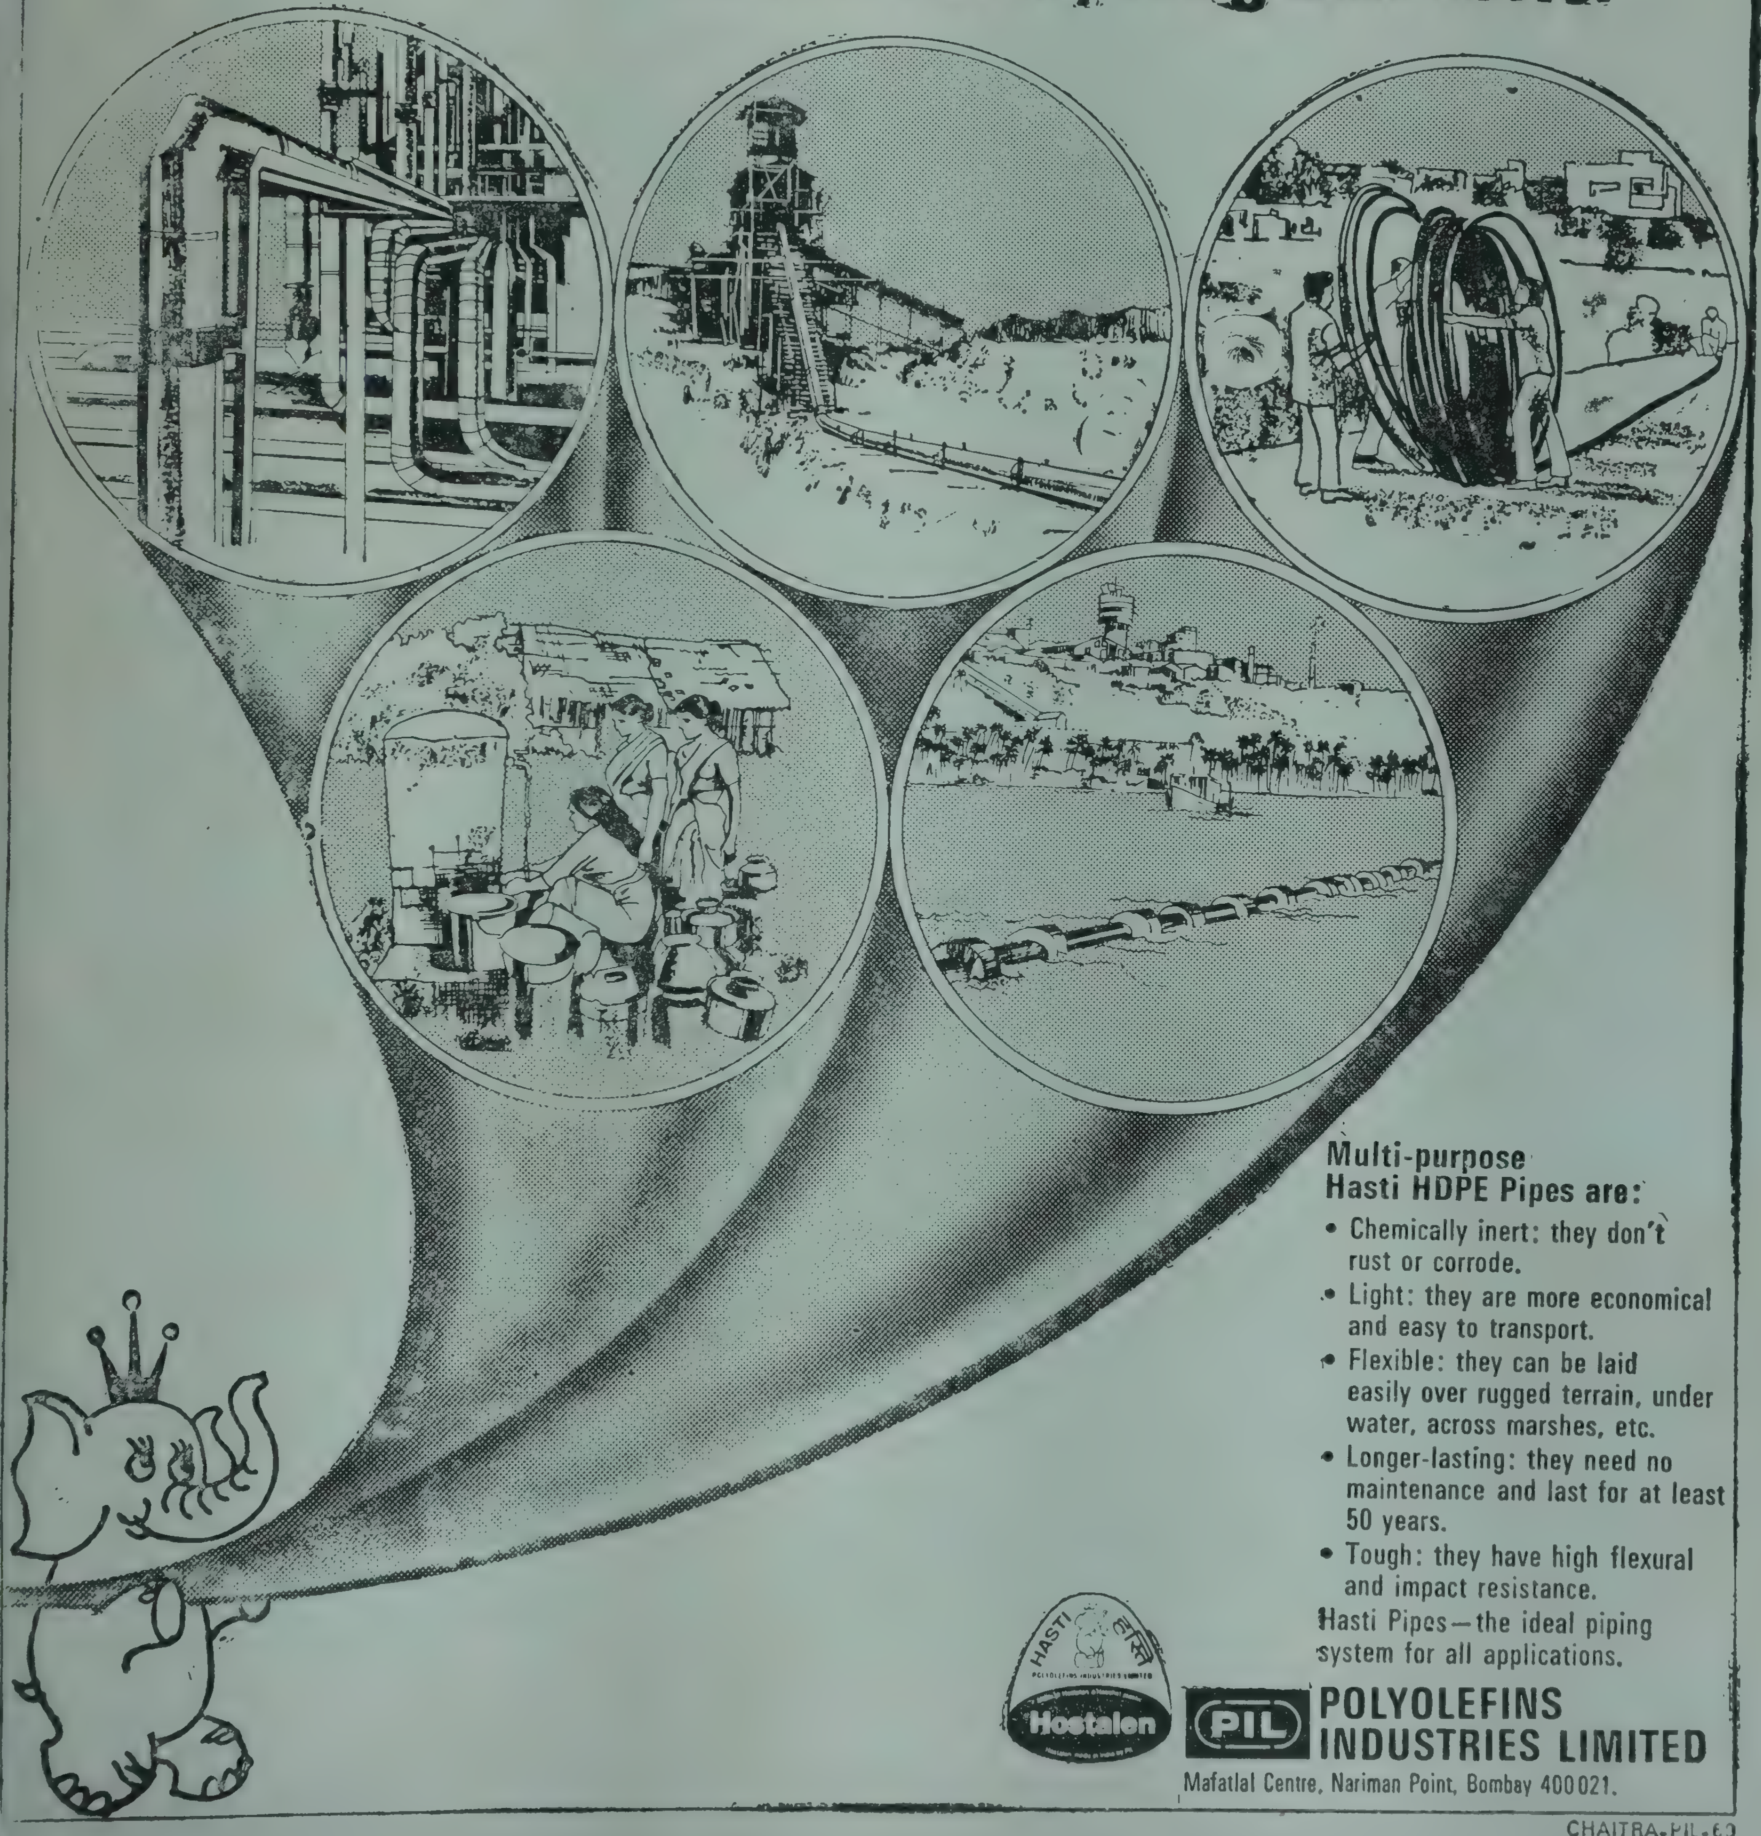
Gas. Slurry. Chemicals. Effluents. Water.
You name it...

HASTI HDPE PIPES
are ideal for anything that flows.



Multi-purpose
Hasti HDPE Pipes are:

- Chemically inert: they don't rust or corrode.
- Light: they are more economical and easy to transport.
- Flexible: they can be laid easily over rugged terrain, under water, across marshes, etc.
- Longer-lasting: they need no maintenance and last for at least 50 years.
- Tough: they have high flexural and impact resistance.

Hasti Pipes—the ideal piping system for all applications.

CDS with incentives

By P. CHATTOPADHYAY

THE Compulsory Deposit Scheme (Income Tax Payers) Amendment Ordinance, 1981 promulgated by the President on July 11, 1981, raises several important issues which require consideration. The compulsory deposit scheme for income tax payers that came into effect in 1974 had several laudable objectives behind. In the context of biting inflationary pressure, it was necessary that a part of the annual income of income tax payers was taken out of circulation, on the one hand, and canalised into productive lines, on the other. The two-fold effect of reducing the excess liquidity in the hands of income tax payers and effective deployment of the amount for purposes of government had some desirable effect on the economy. Though in the larger scheme of things the amount so impounded was small, the absolute figures were never negligible.

At the end of March 31, 1980, the outstanding amount held under Compulsory Deposit Scheme (Income Tax Payers) Act, 1974 stood at Rs 470.06 lakhs. Inclusive of the amounts maintained in terms of the Additional Emoluments (Compulsory Deposit) Act, 1974, additional wages account being Rs 4.11 lakhs, additional dearness allowance account (old) Rs 188.53 lakhs and additional dearness allowance account (new) Rs 322.49 lakhs, the total at the end of 1979-80 stood at Rs 985.18 lakhs. The highest outstanding amount was at the end of March, 1978 when the total amount stood at Rs 1,508.38 lakhs. The enhanced rates of compulsory deposits for income tax payers will yield some fifteen crores of rupees.

These figures of outstandings under the compulsory deposit scheme, however, relate only to the balances of amounts received at the offices of the Reserve Bank of India. It will be noted that almost all the nationalised banks and State Bank of India have received such deposits from income tax payers and have maintained separate accounts therefor. The total amount received as also the amount outstanding will be substantially higher if receipts at all these offices other than the Reserve Bank of India are also taken into account.

The ordinance raises the rates of compulsory deposit and specifies the period of application of the enhanced rate. The new schedule of rates applicable to different income classes is as follows :

(i) Where the current income exceeds Rs 15,000 but does not exceed Rs 25,000–4.5 per cent of the current incomes;

(ii) Where the current income exceeds Rs 25,000 but does not exceed Rs 35,000–Rs 1,125 plus 11 per cent of the amount by which the current income exceeds Rs 25,000;

(iii) Where the current income exceeds Rs 35,000 but does not exceed Rs 50,000–Rs 2,225 plus 12.5 per cent of the amount by which the current income exceeds Rs 35,000;

(iv) Where the current income exceeds Rs 50,000 but does not exceed Rs 70,000–Rs 4,100 plus 15 per cent of the amount by which the current income exceeds Rs 50,000;

(v) Where the current income exceeds Rs 70,000–Rs 7,100 plus 18 per cent of the amount by which the current income exceeds Rs 70,000.

It will be seen that the rates are effectively enhanced only for classes of assessees having an annual assessable income of more than Rs 50,000. For stages below this limit, the rates have not been tampered. And for making this small change, critics say, there was some drama enacted in view of the hurry with which the ordinance was promulgated and the urgency that this problems was shown.

Some of the objectives behind the compulsory deposit scheme stand negated when every year refund is allowed out of earlier deposits standing for a certain number of years. This refund adds to the current pressure on consumption and the annual deposits made by income tax payers are in effect reduced by the amounts of refund made during the year. Perhaps government could find out some alternative means for making this refund in other ways than cash. If CDS refund could be made by way of national saving certificates or the period of refund further extended by three years and amounts of refund not withdrawn allowed to carry interest at the rate of twelve per cent per annum, not only that government's purpose could be served but also that the income tax payers would remain satisfied with the interest rate which would be two per cent higher than fixed deposits for like periods.

In many cases, it has been the experience that the compulsory deposit scheme does not really initiate savings of the people. Income tax payers transfer from their bank account the amount required to be deposited under the CDS. However, though this amount comes by way of transfer from one account to another, there is the added condition that amounts outstanding under CDS cannot be withdrawn at will by the depositor. This deferment is rather small as an effect on the economy. Government can also think of giving some incentive to the depositors under CDS by way of a rebate of say five per cent on income tax corresponding to the amount deposited in CDS account. Thus, if the annual compulsory deposit amount of income tax payers comes to Rs 3,000, Rs 150 may be deducted from the amount of tax to be paid.

In addition, refund of interest allowed under the scheme every year may be totally exempt from tax. It will be recalled that annual refundable amount of CDS interest is to be included under the Income Tax Act in the assessable income of assessees subject to such ceilings and conditions that govern interest rates for assessment purposes. If incentives allowed for deposits under CDS are attractive, rate of deposit under the scheme can be further increased or an option may be given to assessees to deposit amounts higher than the required limits prescribed under the Compulsory Deposit Scheme (Income Tax Payers) 1974 as amended. Very recently government has made withdrawal of CDS refund voluntary and such amounts as the depositors are entitled to withdraw will earn interest at the same rate as applies to amounts held under CDS. The net effect of this change has been rather negligible.
